Daily Weather Summaries for September 2020

If you have any questions or feedback about this product or wish to obtain further data please contact the Met Office.

This document contains daily weather summaries for each day of September 2020. The Met Office National Meteorological Library and Archive holds a continuous record of daily weather summaries or daily weather reports from 1860, and these daily weather summaries form a continuation of that series.

The purpose of each summary is to provide an overview of the weather conditions across the UK on that day, with the historical emphasis mainly based on observations from surface network of weather stations, although the format has varied over the decades. While the emphasis remains on observations from the surface network, the current daily weather summaries supplement these by including satellite and rain-radar imagery to provide a more complete overview. The current format of the daily weather summaries is as follows:

1. Text summary of the main characteristics of the weather during the day, written by an operational meteorologist in the Met Office operations centre.
2. Table of daily extremes for the UK for key climate variables including temperature, rainfall, sunshine and gust speeds.
3. Overview of the synoptic situation at 00 and 12 UTC comprising: analysis charts showing the surface pressure pattern and associated weather fronts; North Atlantic and European infra-red satellite images showing cloud-cover; combined infra-red and rain-radar images of the UK; maps of wind speed and direction at 00 and 12 UTC; observations of pressure, wind speed and direction, cloud cover, air and dewpoint temperature at selected UK and European stations in data tables.
4. UK maps of key climate variables from observing stations including maximum, minimum and grass minimum temperature, rainfall, sunshine, gust speed and snow.
5. Further guidance notes

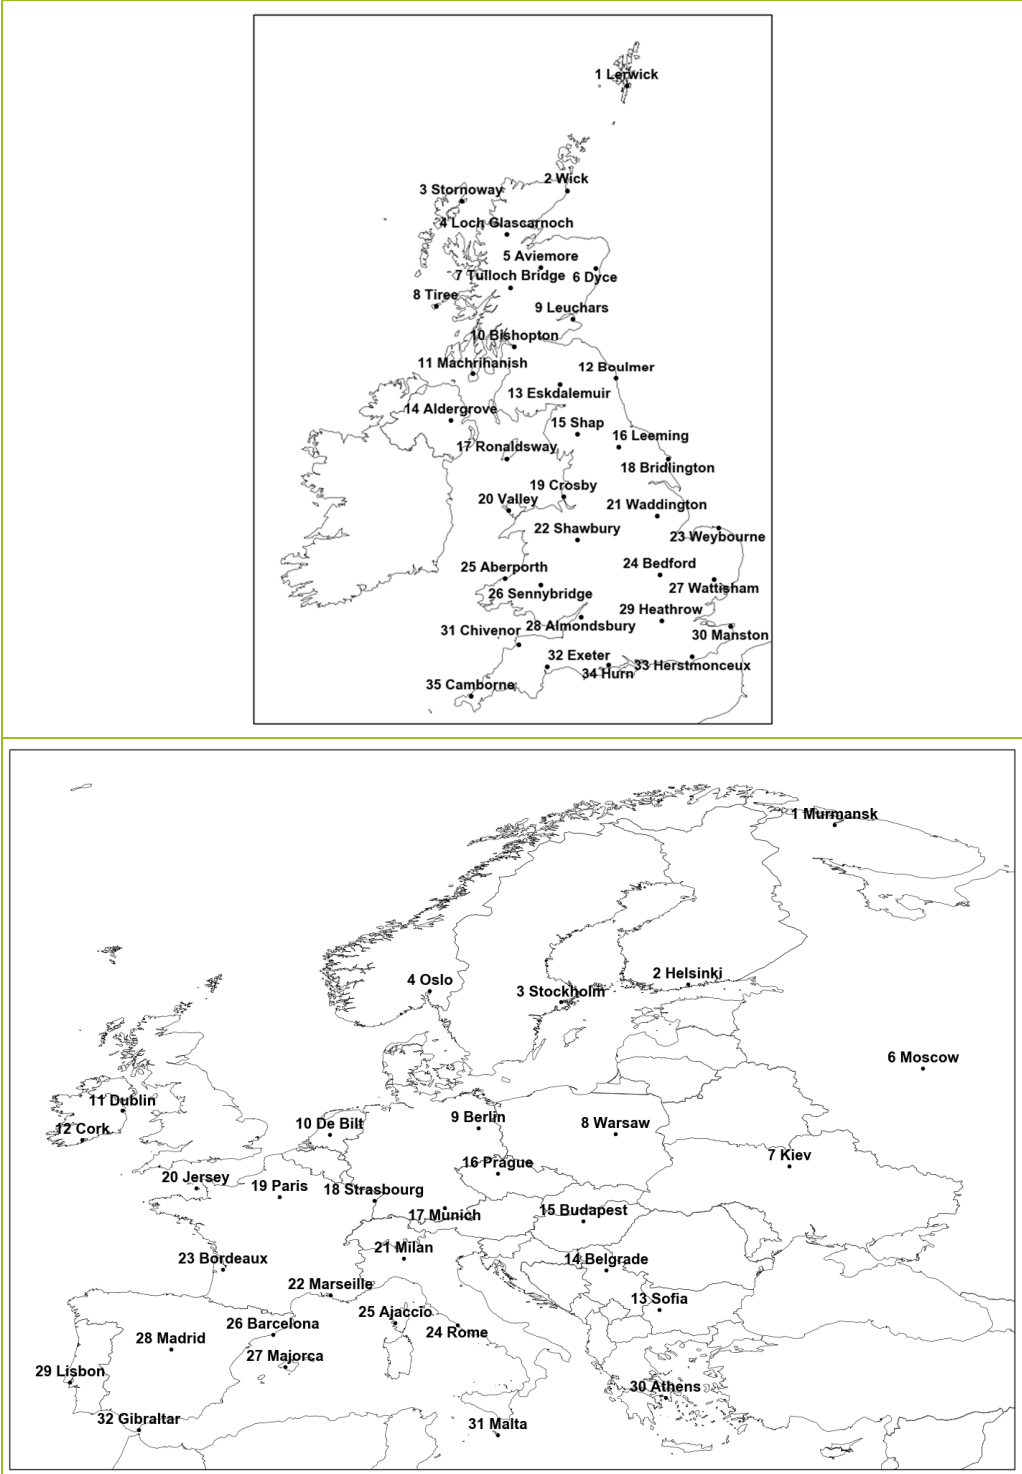

If you spot any data errors or omissions in this product please contact the Met Office.

Daily Weather Summary for Tuesday 01 September 2020

This day's summary created 08/09/2020 03:00

Summary of the UK Weather for Tuesday 01 September 2020

It was a settled night for the UK, with all regions remaining predominantly dry. Most areas observed largely clear skies with the odd patchy cloud, though a more widespread band of cloud and rain began to infringe on the far northwest of Scotland in the early hours. Early morning cloud across central parts of England quickly dissipated after sunrise, leading to a bright dry day with some patchy cloud developing later in the afternoon. Scotland saw the worst of the weather, with low cloud and fragmented bands of rain effecting most places, with the exception of far eastern Scotland which remained generally clear and sunny.

Summary of the UK Weather for Wednesday 02 September 2020

England and Wales remained largely dry overnight with clear skies in many places. A band of rain over western Northern Ireland and northwest Scotland moved slowly eastward through the night arriving into west Wales by dawn. Winds were generally light across most of the UK. From early morning the band of rain advanced east across the UK from the far west, reaching from north Scotland to all but the most southern areas, bringing overcast skies. Meanwhile in the east skies were largely clear with some fog patches in inland areas. By midday it covered the west of the UK with the heaviest precipitation in Wales and the Midlands. In the late afternoon it advanced over the east of the UK, starting to clear in the southwest. Winds were generally light but turned strong in most areas as the rain band approached. Through the evening, heavy rain progressed east over Scotland, with the far north remaining largely dry. For England, as it moved off east, the band of rain fragmented becoming lighter in the south east, but remained heavy for northern areas. The South west and Wales remained relatively dry with only light patches of rain and showers.

This day's summary created 10/09/2020 03:00

Summary of the UK Weather for Thursday 03 September 2020

The early hours saw a band of rain and drizzle sat across Wales and the northwest of England; with the heaviest rain over the welsh mountains. Elsewhere remained relatively cloudy with the exception of northeast Scotland, which had little to no cloud. Fragments of rain lingered in the southeast and west of Scotland following the frontal system that passed the day before. Through the rest of the morning it remained largely overcast across the south and East Anglia as the band of rain pushed eastward. Further north there were scattered showers with some heavier and more persistent outbreaks across western Scotland. However, there were some cloud breaks elsewhere too, and in the northeast it was generally dry. In the afternoon the showers across northern England dried out but in Scotland the rain continued and a heavier band began approaching the far northwest towards Stornoway later. In the south, the band of cloud and rain continued eastward, just starting to clear the far southwest by around mid-afternoon.

Summary of the UK Weather for Friday 04 September 2020

England and Wales stayed largely dry overnight, with any patches of rain dying away in the early hours. Northern and central Scotland saw scattered showers whilst the south stayed dry. Patchy cloud covered most of the UK throughout the night. It was a generally cloudy morning across England and Wales with a few areas of patchy light rain in the far south, whilst across the midlands it was mostly dry. Further north there were some more cloud breaks and sunny spells in some areas, but also scattered showers. Particularly across parts of Scotland and Northern Ireland, some of these showers were heavy at times, and these spread more into northern England later into the afternoon. Meanwhile, a band of cloud came eastward across the south of the UK, bringing rain to the far southwest of Wales by early afternoon and generally covering much of the southwest by the evening.

This day's summary created 12/09/2020 03:00

Summary of the UK Weather for Saturday 05 September 2020

The night started out with clear spells and scattered showers for most of the UK, with some lightning strikes around the coast of the southwest and Wales. Meanwhile the south-east saw overcast skies with a band of rain, clearing towards the south-east. By early morning the rain band had passed and clear spells covered the country in general, with showers reducing in frequency and becoming largely confined to the north. The wind was mostly breezy but calmed in the early morning. It was clear skies for most of the south and east of the UK during the morning. However, it remained generally cloudier across the northwest of England, Wales, Scotland and Northern Ireland with scattered showers. It became slightly cloudier across the UK by mid-morning but still with plenty of sunny spells everywhere. Showers were then mainly confined to the North of England and Scotland, particularly along northwest coasts where they turned heavy at times. Everywhere else remained largely dry. Light/moderate winds in the south during the day, stronger in the north and along western coasts, easing through the afternoon/evening.

Summary of the UK Weather for Sunday 06 September 2020

Overnight it was cloudy across much of the UK with a large area of persistent rain moving southward across northeast England, and a second band of rain moving over Northern Ireland and western Scotland. Elsewhere occasional outbreaks of rain spilt out in most regions at times, but mainly in the southwest which had some heavier bursts, and also the far north, and later coastal parts of Wales. The southeast did generally remain dry and saw some clear spells as well. The winds were generally light everywhere. Patchy cloud remained across much of the UK throughout the day. This was associated with showers that developed in the early morning across the Scottish borders, coastal areas of Wales and the southwest of England. These showers progressed in a southeastwards direction throughout the day, moving into parts of north England, central Wales and the West Midlands. Scotland and southeast England remained predominantly dry and saw a good number of bright spells.

Summary of the UK Weather for Monday 07 September 2020

Dry start to the night for most of the UK. A band of rain and widespread cloud moved south-eastward over western Scotland and parts of Northern Ireland. Some lightning strikes were recorded early in the period across the south and southwest England and Wales but remaining dry. The band of rain reached northern England by the end of the period. Some coastal and rural areas in the south and East Anglia were affected by patches of fog. The UK was generally cloudy, although clearer in the south. The winds were light across the UK, though stronger in the west and north-eastern parts of Scotland. Feeling average for the time of year. A frontal system moved southeastward across the UK through the course of the day. This brought a band of rain and low cloud first to western areas. Ahead of this was a band of rain and drizzle which affected the east during the morning. The front weakened and continued to progress southeastwards during the afternoon although the far southeast remained dry until the evening. Widespread cloud behind the front.

This day's summary created 15/09/2020 03:00

Summary of the UK Weather for Tuesday 08 September 2020

Much of the UK remained dry through the early hours of the morning. However, there were some isolated patches of rain and drizzle over northeast England and over Wales and some more persistent rain in the far northwest of Scotland. It remained largely cloudy with low cloud over much of south and central England and Wales with some patches of mist and fog in places, particularly over upslopes. Moderate winds for most but breezier in the north.

Much of England saw sunny spells throughout the afternoon with the clearest skies in central and south western areas. Some rain and drizzle over the North West England, Wales, and Western Scotland, but dry elsewhere. Some drizzly outbreaks occurred in the early evening for central and northern areas of the UK with heavier rain and low cloud in northwestern Scotland. Elsewhere remaining dry.

This day's summary created 16/09/2020 03:00

Summary of the UK Weather for Wednesday 09 September 2020

A dry start to the night for most of the UK. However a band of patchy rain and low cloud moved eastward across northern England and north Wales as well as northwest Scotland. The southeast saw clear skies which led to the formation of some mist and fog patches in the south. The rain and low cloud continued to move southeastward across the UK including into more central Wales towards dawn. The band of rain and low cloud continued to move southeastward and the rain became increasingly patchy throughout the day. Behind this most places were dry with sunny spells. However, there were scattered showers over parts of Scotland. The band of cloud eventually cleared the south of the UK in the late afternoon, leaving a fine and dry evening for most across England and Wales with plenty of clear spells. But, patchy cloud and isolated showers continued to affect northwest Scotland and Northern Ireland.

Summary of the UK Weather for Thursday 10 September 2020

It was a dry night for most of the UK, with clear spells across much of England and Wales. Patchy cloud affected more northern areas, with some isolated showers infringing on the far north west of Scotland through the night. Winds remained light throughout the overnight period. Through the morning it remained dry with plenty of sunny spells across the south and southeast. Meanwhile, further north it was cloudy but mostly dry across the rest of England and Wales aside from a few isolated showers in central areas. There were more widespread outbreaks of rain across Northern Ireland and Scotland, particularly in the far northwest. Into the afternoon, a band of more persistent and heavier rain swept across the far north of the country, whilst further south the cloud pushed eastward but still steered mainly clear of the far south. The winds stayed generally light, though breezier in the far north.

Summary of the UK Weather for Friday 11 September 2020

The rain and strong winds over the northwest of Scotland continued and became more widespread throughout the night. There was some patchy rain over northern England but it was mostly dry elsewhere. It was largely cloudy but some clear patches in the south lead to a chilly night. The morning remained cloudy in most areas with a band of precipitation affecting the west coast of Scotland and Northern Ireland, seeing heavy rain in some areas. As the morning progressed, the cloud cover remained largely overcast. The rain band meanwhile progressed south east, now affecting the north of England, leaving all but the south of Scotland with some scattered showers and sunny spells. Through the afternoon the precipitation continued southeast, but weakened in area and intensity, reaching north wales by early evening. Areas north of the rain band continued to see scattered showers with some clearer spells, while areas to the south also saw skies becoming clearer. Throughout these periods, the wind ahead of the rain band was generally light for most, while after its passing, winds became strong and gusty.

Summary of the UK Weather for Saturday 12 September 2020

It was a largely dry night for the majority of the UK with the best of the clear spells in the south. A band of showery rain lingered across northern England and north Wales through the early hours, before slowly sinking southwards across central England towards dawn. Parts of Scotland saw some showers overnight, these most frequent and heaviest in the west. Away from northern Scotland and north western England it was a largely dry day with sunny spells developing through the afternoon across central and eastern England. Locally heavy rain arrived across Northern Ireland and north western Scotland during the morning and slowly moved eastwards through the afternoon. The rain crept into far north western England towards evening.

Summary of the UK Weather for Sunday 13 September 2020

The night started out largely clear skies in the south of the UK, whilst the North saw a band of rain and cloud pushing east. Later on more southerly areas has begun to cloud over whilst the rain had retreated further north over Scotland, seeing some higher intensity precipitation. Towards early morning the area affected by the rain had retreated to the far north-west. All but the most southerly areas saw cloud building to become overcast. During this period, winds were generally light in the south while strong and gusty in northern areas. In the afternoon much of the UK remained dry, although the north of Scotland saw heavy rainfall throughout the period, particularly in the north-west where the rainfall was constant. Scotland and far north-west of England stayed rather cloudy, and south-west Wales for a time, while elsewhere stayed clear. Generally feeling warm across the central and southern regions.

Summary of the UK Weather for Monday 14 September 2020

Early in the night skies were clear over most of the UK. However, the north of Scotland saw overcast cloud and long outbreaks of rain during this time. Towards the morning the rain began to fade, reducing in intensity and area. Overcast cloud started to develop further covering most of Scotland and some of northern England, while further south skies remained largely clear. Winds were mostly light overnight, but were stronger in northern areas. Conditions remained fine and dry across England and Wales, with both countries experiencing predominantly clear skies throughout the day. Scotland and Northern Ireland saw patchy cloud, resulting in sunny spells. It still remained largely dry across the latter two countries, though the odd isolated shower affected northern Scotland in the morning and a more persistent band of rain began to push into the far northwest from mid-afternoon. Winds remained light, except northern Scotland where they were slightly stronger. Through the evening and the first part of the night rain continued to effect northwest Scotland and Northern Ireland. Clear skies remained in eastern England.

Summary of the UK Weather for Tuesday 15 September 2020

To start the night, the majority of England and Wales remained dry apart from a few showers in the far west and in the north. Scotland saw a more organised band of rain and Northern Ireland a band of showers. This continued through the night. Much of eastern England saw clear skies for a time, with some fog developing. The rain moved northward and cleared Scotland by the end of the morning. A band of showers moved north over the southwest of England during the morning and into Wales through the afternoon. A few other isolated showers also occurred over southern areas. Fog lingered in some places in the far southwest all day. Elsewhere there were largely clear skies with light winds. This allowed for widespread high temperatures. Through the evening, the band of showers continued moving north, affecting areas of north Wales and northern England. Fog continued to persist in the southwest, while patchy cloud spread over much of England.

This day's summary created 23/09/2020 03:00

Summary of the UK Weather for Wednesday 16 September 2020

It was a mixed picture across the UK overnight. A band of patchy cloud moved east across England, bringing isolated showers initially to East Yorkshire and then later to southeastern counties. Further isolated light showers began to develop in the early hours across central Scotland. Meanwhile, coasts along southwest England and Wales under clear skies observed fog from the start of the night. This progressed inland and into areas of northwest England through the night. Elsewhere, the night was fine and dry with some patchy cloud. The fog and mist in the southwest lingered along the coast well into the afternoon, while a band of cloud and patchy rain moved south across the north of the UK. Elsewhere, it was a dry day with sunshine and prolonged clear spells, particularly in the southeast. The dry weather continued into the evening, with southern counties of England retaining clear skies throughout, except for the lingering fog in the far southwest. Meanwhile, the band of cloud continued moving south across Wales and central England, though with no reported precipitation.

Summary of the UK Weather for Thursday 17 September 2020

Overnight, it was dry and settled across much of the UK, but a few isolated showers broke out across central Scotland in the early hours. A band of cloud moved its way south over central and southern England and Wales, though parts of west Wales and southwest England retained clear skies. It turned increasingly windy across southern counties of England and south Wales, with strong gusts developing along coastlines. Some of the cloud lingered across central England, Northern Ireland and the far northwest of Scotland throughout the morning. Elsewhere, it was fine and dry day with plenty of sunshine. It was breezy in the far north and the far south. By the evening there was widespread clear skies.

Summary of the UK Weather for Friday 18 September 2020

Overnight it was dry and settled across the whole of the UK. Many areas experienced clear skies, with fog and mist being observed from the start of the night in some areas in northern England and through the early hours in Scotland as well. Many areas had light winds but it was breezier along the south coast. Towards dawn some cloud moved into some central and northeastern areas. It was a generally fine morning with plenty of sunshine around. The southern third of the UK saw prolonged sunny spells at first whilst there was more patchy cloud across the midlands and the north of England. In the far north there was a band of thicker cloud across Stornoway, the Orkneys and Shetland. Through the afternoon, a second band of cloud began to spread northward across the far south of the country, ahead of a cold front around the Bay of Biscay. Across the UK the winds were generally light to moderate.

Summary of the UK Weather for Saturday 19 September 2020

Overnight it was dry across the UK, with generally clear skies, though cloud covered the far southwest. It was breezy across most of England but winds were calmer across Scotland where fog developed throughout the night. In Scotland the morning started out with fog over many areas that cleared towards afternoon. Northern areas largely saw scattered cloud through the morning, while southern areas saw little cloud, save for a few outbreak of rain along the south-west coast. The outbreaks of rain in the south continued through the afternoon and into the early evening, while elsewhere most areas stayed dry. At the same time, cloud over the UK generally thinned leaving the majority of places with long sunny spells. Winds during this period were fairly breezy in south and central areas, reaching high speeds in some inland areas, while the north and Scotland saw light winds throughout.

Summary of the UK Weather for Sunday 20 September 2020

It was dry across the UK overnight with clear spells, although there was scattered cloud over the far south. Mist and fog patches developed overnight in northern Scotland and patchy low cloud formed in parts of eastern Scotland, northeastern England and later in central England. It remained dry throughout the day across the UK. The cloud cleared from central England through the morning, but remained over areas of southeast Scotland and northeast England well into the afternoon. Low cloud and fog also persisted across the far north of Scotland through the day. Elsewhere, it was a fine day with light winds, predominantly clear skies and long periods of sunshine. The generally fine conditions continued into the evening as there were mostly light winds and clear skies across the UK, apart from the far north where the band of cloud across parts of Scotland persisted.

Summary of the UK Weather for Monday 21 September 2020

It remained dry overnight across the UK although a band of rain was holding just off the coasts of northern Scotland and slowly moving southward. With light winds, low cloud and patches of mist and fog developed and spread across many eastern, south-eastern and central parts of England. Although in the far north the winds were stronger, there was plenty of cloud here also. Meanwhile, western parts of the country generally had a clearer night. The fog slowly burned off across England through the morning, leaving clear skies once it had done so. This meant much of the country, along with Wales, experienced a fine and dry day with prolonged sunshine. However, cloud moved in over Scotland and Northern Ireland. The rain associated with this began to infringe on the northwest of Scotland from the afternoon onward. Winds remained light across England, Wales and Northern Ireland throughout the day, but were blustery across northern Scotland.

Summary of the UK Weather for Tuesday 22 September 2020

Early in the night the UK was split, the south seeing very few clouds and no precipitation while the north had overcast skies and outbreaks of rain, particularly in northern Scotland. This trend continued through the night to the early morning, with the northern precipitation becoming more widespread and persistent. Meanwhile, in the absence of cloud mist and fog patches formed in multiple locations across England and Wales. Throughout this period winds were mostly light through southern areas while in the north speeds were breezy, reaching high speed in some coastal localities. England and Wales remained dry through the morning with cloud building from the west. Rain continued across northwest Scotland slowly progressing southeastwards. Through the afternoon it became increasingly cloudy from the west with some showers in the southwest, Wales and northern England. There were some patches of haze and drizzle in the south. The band of rain continued to affect northwest Scotland and Northern Ireland, progressing very slowly southeastwards. Some eastern areas of England had clear skies into the evening.

This day's summary created 30/09/2020 03:00

Summary of the UK Weather for Wednesday 23 September 2020

Overnight, a band of rain, sometimes heavy, moved southeastwards across the UK, passing over northeast England and Wales during the early hours and also south west England later on. Scattered showers and clear spells followed behind this. Spells of rain also occurred ahead of this main band associated with the thickening cloud. These rain spells occurred initially over south west England and south Wales before moving northeastwards across southern counties of England through the night. To start the day, the main rain band lay from northeast England to southwest England. This rain progressed slowly southeastwards through the day bringing low cloud and heavy rain to some places. Behind the front, largely clear skies were observed to start, with some scattered showers and higher cloud forming through the day. As the rain moved eastward it became more fragmented in nature. Thundery showers were observed in the Wash area and off the Pembrokeshire coast during the afternoon. Temperatures post front were significantly lower than those ahead. Through the evening, the remnants of the front continued to move eastwards with further showers behind.

This day's summary created 01/10/2020 03:00

Summary of the UK Weather for Thursday 24 September 2020

Wednesday's band of rain cleared northeast England in the early hours of the night. However, another band began to move into the west, initially influencing southwest England and south Wales. This new band of rain, which was heavy at times, moved fairly quickly northeastwards, affecting southern and central areas of England as well as Wales through the course of the night. Behind the rain was a mixture of clear spells and widespread showers, the isolated one being thundery. Scotland and Northern Ireland remained dry for much of the night, with a mixture of clear spells and patchy cloud. Throughout the day there was widespread rain and showers across England with thunderstorms. Scotland was largely dry to start but the band of rain continued northwards and reached the south of Scotland around noon. It was windy in the west of the UK. Through the evening the showers continued to be widespread across England and Wales with strong, gusty winds in the southwest. Much of northern Scotland remaining dry.

Summary of the UK Weather for Friday 25 September 2020

Overnight much of western England and eastern Wales remained dry with clear skies. A band of fragmented rain moved southwards over western Wales and parts of Cornwall accompanied by strong, gusty winds. A separate band of rain moved eastwards along southern coastal regions clearing east through the early hours. A third system brought continuous rain and low cloud to East Anglia and some parts northeastern England through the night as well as strong and gusty winds along North Sea coasts. A band of showers trailed the east coast including eastern Scotland. It was a widely chilly night. A slow-moving band of rain sat over much of the eastern coastal regions of England, covering much of East Anglia. Scattered showers developed in western regions later in the morning and penetrated further inland during the afternoon over northern England, and along the southwest coasts of England and Wales. Winds were moderate to strong across the country, strongest in East Anglia. Fairly cloudy in the north and east and southwest coast but stayed generally clear in central and southern areas through the evening.

Summary of the UK Weather for Saturday 26 September 2020

Friday's rain band continued to affect East Anglia through the night accompanied by strong, gusty winds. Another area of rain skirted the far southwest of Cornwall through the early hours. Elsewhere in the UK, several areas of showers moved southwards through the night, including some across Wales and some along the North Sea coasts of northeastern England and northern Scotland. It was a widely breezy night with the strongest winds in the southeast. Many areas not affected by the rain saw clear skies. The rain over East Anglia became lighter and more fragmented by dawn. A clear and dry start for much of the country except for East Anglia, much of the east coast of England and some eastern areas of Scotland which saw some rainfall. This rain moved slowly southwards through the day affecting many northern areas. Showers also occurred in the southwest of the country for a period in the afternoon. Much of the country turned cloudier through the course of the afternoon, as frontal cloud moved in from the east.

Summary of the UK Weather for Sunday 27 September 2020

Overnight it was generally dry with clear spells, except for in the far southeast which saw outbreaks of rain in some areas. It was also windy across the southeast of England, especially in coastal areas. The morning started off dry for most of the UK, rain only being seen on the far south-east coast. Most areas along the east coast had broken or overcast cloud while other areas generally had clear skies. Towards afternoon the cloud remained similar and the rain cleared to the south-east. Meanwhile another area of rain was seen approaching the north-west of Scotland. By early evening outbreaks of rain were seen across northwest Scotland with cloud over the country turning patchy. In the rest of the UK it remained dry with skies staying cloudy in the east and clearer in the west.

This day's summary created 06/10/2020 11:43

Summary of the UK Weather for Monday 28 September 2020

Generally dry start to the night across the UK. A band of cloud present over much of the country, but clearer in the south and central regions. The band of cloud moved eastward throughout the period, and some occasional lightning strikes were recorded in the Irish Sea early in the period as some light patchy rainfall over far north of Scotland and Northern Ireland moved eastwards following the cloud band. The band of cloud continued to move in from the west and light rainfall continued overnight. Through the day the band of cloud and rain progressed eastwards across the UK. The most persistent and heaviest rainfall was focused over Scotland during the morning whilst much of England and Wales remained generally dry until the afternoon. However, some patches of light rain affected southwest coasts of England during the morning. Drier conditions with plenty of clear skies followed into Scotland and the rest of the UK later in the evening but along with some scattered showers in the far northwest. Winds remained light over much of the UK through the day.

Summary of the UK Weather for Tuesday 29 September 2020

Outbreaks of rain across the west of the UK in the evening with broken cloud. The east meanwhile stayed largely dry with clearer skies. Overnight the rain and cloud progressed eastwards across the country, reaching central areas by midnight. As it cleared, those areas behind it saw fewer clouds much less precipitation. Towards dawn the area of rain was established over the south-east with overcast skies. Other areas of the UK became widely dry with patchy cloud, with mist and fog patches forming in some north-western areas. During the morning cloud, rain and drizzle continued to slowly push eastwards across the southeast of the UK whilst the rest of the UK remained largely dry with clear skies for many. Overnight fog patches started to clear soon after dawn. By midday any remaining rain and drizzle was confined to the far east of England where the cloud also remained lowest and the most widespread. Otherwise it was generally a dry day for the rest of the UK with long sunny spells. Wind remained light through the day.

Daily Weather Summary for Wednesday 30 September 2020

This day's summary created 07/10/2020 03:00

Summary of the UK Weather for Wednesday 30 September 2020

At midnight the band of rain approaching from the west was starting to reach western coasts in northern areas, turning skies to broken cloud. Ahead of it, skies were still largely clear with some mist and fog forming in the south-east. By early morning the rain and cloud were established over Scotland, as well as much of England's west, with the precipitation heavy at times. In the east skies stayed mostly clear. Winds were light, turning strong after the rain band arrived. Through the day the low cloud and rain progressed slowly eastward across the UK. Skies in the far east remained clear for most of the morning. Ahead of the main band of rain was some lighter showery outbursts. By mid-afternoon the rain had cleared Cornwall and Wales. It also split leaving a dry band around the Scottish borders. Behind the band of rain temperatures were lower and there were further bands of showers pushing into the west. By the evening the main band of rain was confined to the east with showers in western areas.

Daily Weather Summary for Wednesday 30 September 2020

Daily Weather Summary for Wednesday 30 September 2020

None of the selected stations observed a day of sleet or snow falling or non-zero snow depth at 0900 UTC.

Guidance Notes

UTC = Universal Coordinated Time. For the UK UTC is the same as GMT (Greenwich Mean Time).

National boundaries shown on the European station map are for illustrative purposes only.

Daily extremes

- Daily extremes have been manually confirmed by Met Office Observations Quality Management as valid observations from the live database at the time of checking. However, more extreme values may still be possible if they occur after the time of production.
- Mountain stations above 500 masl are excluded from lowest temperatures, highest gust speeds and greatest snow depths at 0900 UTC. This is because they are not considered representative of low level areas.
- Counties quoted against each station are based on historical county boundaries pre-1974 and may not reflect current administrative boundaries.

Analysis charts and satellite imagery

- The satellite imagery is infra-red imagery from the geostationary MSG satellite.
- The rainfall image is derived from satellite data from MSG and rain-radar data. This represents a snapshot of instantaneous rain-rates at 0000 UTC and 1200 UTC and so does not necessarily reflect daily accumulations in the rainfall station map.
- Any analysis charts or satellite images which are unavailable will be displayed as white space.

Station maps

- The UK maps show station data for the same set of stations presented UK data table. These stations are selected to provide good spatial coverage across the UK; they represent only a fraction of the overall UK observing network.
- Wind speed maps show wind speed in Kt and direction both averaged over the hour up to the time of observation. 1 Kt = 1.151 mph.

Hourly station data

- The data tables provide spot hourly observations from synoptic messages at 0000 and 1200 UTC. Missing data are denoted by '-'.

- Pressures are mean sea level pressure in hPa.
- For UK stations, Gibraltar and Jersey, the wind speeds and directions are both averaged over the hour up to the time of observation. However, for European stations wind speeds and directions are both averaged over a 10-minute period up to the time of observation.
- Wind speeds are in Kt. Wind directions are stored in the database every 10 degrees and have been converted to the nearest point of the compass. These give the direction the wind is blowing from, not to.
- Cloud amounts are in Oktas from 0 (clear) to 8 (overcast). 9 indicates sky obscured (eg by fog).
- Air temperature and dew point temperature are in Celsius.

Temperature maps

- Daily maximum, minimum and grass minimum temperatures are in Celsius.
- The period for the daily maximum temperature on day D is defined from 0900 UTC day D to 0900 UTC day D+1.
- The period for the daily minimum and grass minimum temperatures on day D is defined as 0900 UTC day D-1 to 0900 UTC day D.
- On any given day D the minimum will typically occur in the early hours of the morning and the maximum in early afternoon.

Rainfall, sunshine and max gust speed maps

- Daily rainfall is in mm from 0900 UTC day D to 0900 UTC day D+1.
- Daily sunshine is in hours from Kipp and Zonen CSD1 automatic sunshine records. Bright sunshine is defined as exceeding 120 W/m².
- Max gust speeds are the daily max gust in Kt from 0000-0000 UTC

Snow maps

- The day of snow falling map displays data from present weather sensors, showing stations which have recorded sleet or snow falling at any point in the day (0000-0000 UTC).
- The snow lying map shows level snow depth as recorded by the automatic snow depth sensors at 0900 UTC. These snow depth sensors do not record snow depth if this is less than 1cm.
- Snow depth sensors are normally operational from October to April, in the event of snow falling outside this period data availability may be limited.
- Snow maps will only be displayed if one or more of the selected stations on that date have recorded either snow falling or non-zero snow depths. If snow maps are not

displayed it is still possible that other stations in the network have recorded a day of sleet or snow falling or non-zero snow depth.
