THE BEAUFORT SCALE OF WIND FORCE.

Beaufort Number.	Admiral Beaufort's General Description of Wind.	Specification for use on Land, based on observations made at Land Stations.	Limits of Mean Velocities Statute Miles per Hour.
0	Calm	Calm ; smoke rising vertically	Less than 1
1	Light air	Direction of wind shown by smoke drift	1-3
2	Slight breeze	Wind felt on face ; leaves rustle	4-7
3	Gentle breeze	Leaves and small twigs in constant motion ; wind extends light flag	-
4	Moderate wind	Raises dust and loose paper ; small branches are moved	8-12
5	Fresh wind	Small trees in leaf begin to sway ; crested wavelets on inland waters	13-18
6	Strong wind	Large branches in motion ; whistling heard in telegraph wires	19-24
7	High wind	Whole trees in motion ; inconvenience felt when walking against wind	25-31
8	Gale	Breaks twigs off trees ; generally impedes progress	32-35
9	Strong gale	Slight structural damage occurs (chimney pots and slates removed)	39-46
10	Whole gale	Seldom experienced inland ; trees uprooted	47-54
11	...	Very rarely experienced ; accompanied by widespread damage	55-63

s snow.
rs sleet.
t rain.
v unusual visibility.
z dust haze; the turbid atmosphere of dry weather.

With present weather is combined, whenever possible, the general character of the weather. A "solidus" divides actual existing weather from preceding conditions, thus :—bc/r = fair weather after rain; i = intermittent; - = "decreasing"; + = "increasing"; h(r) = "hail" or "rain and hail"; Capital letters indicate intensity, suffixed o indicates slight repetition of letters continuity, thus :—
R = heavy rain.
rr = continuous moderate rain.
ro = continuous light rain.

The Meteoro logical Office issues warnings to ports and fishing stations of gales on or near the coasts of the British Isles. When one of these notices has been received at a station a black canvas cone is hoisted.

The South Cone (point downwards) is hoisted for gales for gales from S.E., veering to S.W., W. or N.W.
" S.W., veering to W. or N.W.
" W., veering to N.W.
" E., veering to S. or S.W.

The North Cone (point upwards) is hoisted for gales from S.E., E. or N.E., backing to N.
" N.W., veering to N., N.E. or E.
" N., veering to N.E. or E.
" N.E., veering to E.

The Signals remain hoisted after the receipt of a warning telegram until danger of a gale is passed.

The Districts to which warnings are sent are shown in the British Section of the Daily Weather Report by the following symbols :—

METEOROLOGICAL OFFICE, LONDON.

NOTES ON THE INFORMATION CONTAINED IN THE BRITISH AND INTERNATIONAL SECTIONS OF THE DAILY WEATHER REPORT.

Heights of Stations.—The heights of British Stations above M.S.L. published in the British Section of the Daily Weather Report refer to the plot of ground on which the rain gauge is situated.

Tynemouth.—The height of this station above M.S.L. has been 67 feet since September 28th, 1923, and not as entered in the British Section of the Report.

Guernsey.—The height of this station has been 295 feet since July, 1923.

Pressure.—The distribution of barometric pressure at Mean Sea Level is shown by means of isobars which are drawn for intervals of 2 millibars on the British Section of the Report and for intervals of 4 millibars on the International Section.

The wind at a height of 1,500–2,000 feet above ground usually blows along the isobars and, for the same temperature, pressure and latitude, the speed of the wind is inversely proportional to the distance between the isobars, e.g., for isobars 1 inch apart (160 miles) in the Daily Weather Report the speed of the upper wind is about 12 m.p.h. in latitude 55°, with a temperature of 50° F. and a pressure of 1,015 mb; if, however, the isobars are $\frac{1}{2}$ inch apart the corresponding speed is 24 m.p.h.

The scale below can be used with both the International and the British Sections. If the distance between consecutive isobars is measured along the rule from the left-hand extremity the geostrophic wind is shown by the scale in miles per hour.

GEOSTROPHIC WIND SCALE FOR

4 mb isobars on 1 : 2 $\times 10^7$ Charts.
or 2 mb " 1 : 10⁷ "
or 1 mb " 1 : 5 $\times 10^6$ "

Miles per hour.

This scale applies under the following conditions:—

Pressure, 1,015 mb. Temperature, 50° F. Latitude, 55°.

Corrections.—For an increase of 10 mb pressure, subtract 1% from velocity; for an increase of 10° F. add 2%. From Latitude 55° to Latitude 65° subtract 1% for each degree above 55°. From Latitude 55° to Latitude 45° add 1½% for each degree below 55°.

Weather.—In describing the distribution of weather over a district or during an interval of time such as a day, descriptive adjectives are used with the following meanings:—

Fine—mainly b and bc of the Beaufort notation (see previous page).

Fair or fair generally—mainly bc and c.

Cloudy—combinations of bc, c and o, c predominating.

Overcast—mainly c and o.

Dull—overcast with low heavy cloud.

Varying or variable cloud—combinations of b, bc, c, and o.

Precipitation when occurring is specifically mentioned.

Since the end of April, 1925, the use of the terms "mist" and "haze" has been restricted to cases of visibility between 1,100 yards and 1½ miles. These terms are no longer used for visibility of 1½–6½ miles.

Temperature.—Temperature is specified in degrees Fahrenheit, and is shown on the charts by means of figures written alongside the circles which indicate the positions of the stations.

Upper Air Temperature.—The British observations are made normally, one at 1,000 feet above the level of the aerodrome, and the remainder at pressures of 950, 900, 850, 800, etc., millibars. Heights are then computed and, apart from instrumental error, are correct heights; they do not require modification for differences of temperature from normal as these are allowed for in the computation. The values are shown graphically and in tabular form in the Upper Air Supplement. On the

diagram, temperatures are given in degrees Fahrenheit and Absolute. The oblique line marked "Dry Adiabatic" shows the lapse rate of temperature for dry air ascending or descending under adiabatic conditions, i.e., without communication of heat from external sources. The lapse rate under these circumstances is very approximately 5·5° F. per 1,000 feet, or 10° per kilometre. A lapse rate greater than this value indicates instability in a dry atmosphere.

The broken lines marked Saturated Adiabatic show lapse rates for saturated air. These are for air masses which contain just sufficient moisture at 1,015 mb. pressure to become saturated after rising 1 km. in an environment having the dry adiabatic lapse rate. The condensed moisture is assumed to be retained thereafter in the air as it rises.

The statement contained in the Upper Air Supplement from January 1st to May 31st, 1925, implying that these lines are for air saturated at exactly 900 mb. is not strictly true: the pressure corresponding with a height of 1 km. averages about 900 mb. for the range of temperature considered, but is different for each adiabat.

Times of Sunrise, Noon and Sunset.—In compiling the table of Greenwich times of sunrise and sunset for selected stations in the British Section of the Daily Weather Report, the mean declination of the sun for noon of each day is taken. No account is taken of the variation in declination on any given day as between leap year and the three following years, the same figures being repeated from year to year without change.

Wind.—All wind directions specified in the reports are "true," as distinguished from "magnetic." The arrows indicating wind direction are drawn to fly with the wind. Wind velocities are shown on the charts of the British Section and Upper Air Supplement in m.p.h. by the numbers placed within the small circles. In the International Section velocities are not shown. In both Sections the number of feathers on the arrows denotes wind force by Beaufort number.

Upper Winds.—The direction and velocity of the wind are given in the charts of the Upper Air Supplement for heights of 2,000 feet and 6,000 feet. The data are also given in tabular form for various heights. The reports are usually based on Pilot Balloon ascents.

Wind reports deduced from British Pilot Balloon Ascents refer to the 1,000 feet layers centering at the heights given in the table up to 16,000 feet. When winds are reported at greater heights, they refer to the 5,000 feet layers centering at 20,000 feet, 25,000 feet, 30,000 feet and 35,000 feet.

In the tabular statement direction is specified in degrees from true north measured through East 90°, South 180°, West 270° to North 360°. (See diagram below.)

SUPPLEMENT TO THE DAILY WEATHER REPORT OF THE METEOROLOGICAL OFFICE, LONDON.

SUMMARY OF METEOROLOGICAL OBSERVATIONS AT SELECTED STATIONS ISSUED ON THE 1ST DAY OF EACH MONTH.

Notes on the Weather of JUNE 1925.

The outstanding feature of the weather of June 1925 was the exceptional scarcity of rainfall. Not a single measurement was made throughout the month in some places including Falmouth, Ross-on-Wye and Calshot. At Kew Observatory the total was 1mm, a record for June though in April 1912 the figure was equally low.

During the first few days depressions near Iceland caused west to southwest winds over the greater part of the British Isles and temperature remained generally below 70°F. The ridge of high pressure, however, extending from the Azores spread gradually northeastwards and by the 4th an anticyclone lay over England and the Netherlands. Temperature rose considerably and for about a fortnight warm, sunny weather prevailed. Readings above 80°F. occurred in many places including Eskdalemuir where 82°F. on the 10th was the highest reading taken there in June since records began in 1910.

Meanwhile the anticyclone, after having passed to Scandinavia, had begun to withdraw again westwards across the British Isles to the Atlantic. On the 13th - 14th a depression moved southwards from Iceland to the Baltic and cooler, northerly breezes were associated with a temporary drop in temperature. Readings touched 80°F. again in a few places on the 15th and exceeded 75°F. on the 16th but subsequently pressure increased near Iceland and northerly winds predominated during the next ten days. The weather in the eastern districts was mainly dull and cool, particularly about the 24th when maximum readings remained below 55°F. in several places including London. Some rain fell on the coasts and slight amounts were experienced inland occasionally.

About the 27th the anticyclone over the Atlantic withdrew much further south and a supply of warmer air spread gradually over our islands. Some rain fell in the western and northern districts but did not extend over England where the month closed with bright, warm weather.

Total sunshine for the month reached record figures in several places. At Falmouth Observatory 375 hours exceeded all previous records there by nearly 30 hours.

NOTES ON CHART OF ISOPLETHS (p. 4).

The diagram is obtained by drawing a line from Akureyri in Iceland to the South of France, near Marseilles. The points at which the isobars drawn for 4 mb pressure intervals intersect this line at 1h., 7h., 13h., and 18h. are plotted consecutively and joined to show the variation of pressure from day to day at any point in the line. The line terminates at Lat. 60° N., Long. 18° W. in the north, at Lat. 44° N., Long. 4° E. in the south.

* Based in part on reports made by telegraph in which the day & night measurements are rounded off to the nearest whole millimetre. Small discrepancies may arise between these totals and those given in the Monthly Weather Report which are based on readings taken to 0.1 mm.

phere of dry weather.
h(r) = "hail" or "rain and hail".
(Capital letters indicate intense;
suffix o indicates slight; repetition
of letters indicates continuity.
R = heavy rain. r_o = slight rain.
 rr = contiguous rain.

SYMBOLS.

< = { less than (for cloud height).
| before (for precipitation).
⊕ = solar halo. ⊖ = lunar halo.
With present weather is combined,
whenever possible, the general character
of the weather.

A "solidus" divides actual existing
weather from preceding conditions,
thus -bcl = fair weather after rain;
- = bar = bar decreased + = bar increased

The BEAUFORT SCALE of WIND is used only for surface observations. In the accompanying table the speed of the wind corresponding with the different numbers, is the speed at about 30 feet above the ground.

Scale - 1:10,000,000

All times are G.M.T. Add one hour
to get summer time.

EXPLANATION.

EXPLANATION.—Isobars are drawn for intervals of two millibars.
WIND.—Direction is shown by arrows.

WIND DIRECTION is shown by arrows pointing with the wind. Force, on the scale 0-12, is indicated by the number of feathers. Mean velocity is shown in miles per hour by figures in small circles.

WEATHER SYMBOLS.—

GENERAL INFERENCES.

The large anticyclone is centred over the British Isles increasing in intensity. Settled fine weather will continue with local coast fog. Temperature will be very high to-day, but a fall of pressure over Germany may cause slightly cooler northerly winds in eastern districts to-morrow.

Districts.	Forecasts for the 24 hours commencing 15 h. G.M.T. Wednesday, 10th June, 1925	Further Outlook.
1. S.E. England	Light N.E. to N. wind; fine; rather hazy; hot to-day, perhaps a little cooler to-morrow.	
2. E. England	Light northerly wind; fine; local coast fog; hot inland to-day, perhaps a little cooler to-morrow.	Fine warm weather continuing in all districts; probably mainly fine and warm for some time
3. E. Midlands	As 1.	
4. W. Midlands		
5. S.W. England		
6. South Wales		
7. North Wales	Light variable winds; fine; perhaps local coast fog; hot.	
8. N.W. England		
9. N. Midlands		
10. N.E. England	Light north-easterly or variable winds; fine; local coast fog; very warm in most places to-day; perhaps a little cooler to-morrow.	
11. E. Scotland		
12. S.W. Scotland	As 4-9.	
13. Isle of Man		
14. N. & N.W. Scotland		
15. Hebrides		
16. Orkneys and Shetlands	Light, variable winds; fine; perhaps local coast fog; very warm!

The anticyclone is now centred some distance westwards of Ireland and still shows a slight tendency to recede. Winds will be light from a northerly point, and the cooler and more cloudy weather which has already set in over Northern districts will spread slowly South, though temperature will again be high over Southern England today.

Districts	Forecasts for the 24 hours commencing 15 h. G.M.T. Friday, 12th June, 1925.	Further Outlook.
1. S.E. England	Light wind, mainly N.E. to N.; fine and very warm today; cooler to-morrow, with some clouds; fog locally on coast.	
2. E. England	Light northerly wind; cloud increasing; some coast fog a and perhaps local drizzle; becoming cooler.	
3. E. Midlands	As 1.	Cooler than of late; mainly fair except perhaps in North Scotland
4. W. Midlands		-----
5. S.W. England		
6. South Wales		
7. North Wales	Light northerly wind; fair, but cloudy at times; visibility mainly good; cooler than of late.	
8. N.W. England		
9. N. Midlands		
10. N.E. England	Light northerly wind; cloudy; some coast fog at first, and possibly local drizzle; cooler than of late.	
11. E. Scotland	As 7 - 9.	
12. S.W. Scotland		
13. Isle of Man		
14. N. & N.W. Scotland	Light or moderate W. to N.W. winds; fair to cloudy, slight local showers; visibility good; moderate temperature,	
15. Hebrides		
16. Orkneys and Shetlands		
17. N.W. Ireland		
18. N.E. Ireland		
19. S.E. Ireland

Forecasts for the 24 hours commencing 15 h. G.M.T. Tuesday, 16th June, 1925.

Further Outlook.

1. S.E. England	Wind W. to N.W., light to moderate; fair; good visibility; warm.	Similar conditions continuing.
2. E. England		
3. E. Midlands		
4. W. Midlands		
5. S.W. England	Wind N.W., light to moderate; fair; some coast fog; warm.	
6. South Wales		
7. North Wales	Wind N.W., moderate to fresh; fair to cloudy; some coast fog; warm.	
8. N.W. England		
9. N. Midlands		
10. N.E. England	Wind N.W., moderate to fresh; cloudy, some mist, perhaps drizzle at times, risk of thunder tomorrow; cooler tomorrow.	
11. E. Scotland		
12. S.W. Scotland		
13. Isle of Man		
14. N. & N.W. Scotland	Wind N.W., strong in places; showers at times, thunder locally; visibility moderate to good; becoming cooler.	
15. Hebrides		
16. Orkneys and Shetlands		
17. N.W. Ireland	As 7 - 9.	
18. N.E. Ireland		
19. S.E. Ireland	As 5 - 6.	(A.W.)
20. S.W. Ireland		

The anticyclone remains almost stationary stretching from the Azores over North France but a vigorous depression is developing near the Faeroes and will probably move E.S.E. Winds will freshen from W. to N.W. becoming strong in Scotland. More cloudy conditions are probable in most districts with some rain at times in the North and a risk of thunder locally in Scotland.
