

The map displays the distribution of 25 bird species across the British Isles. Each species is identified by a number and a symbol: a circle, a square, or a triangle. The symbols indicate the type of distribution: a circle for a single point, a square for a range, and a triangle for a specific area. The map includes latitude and longitude lines and a scale bar.

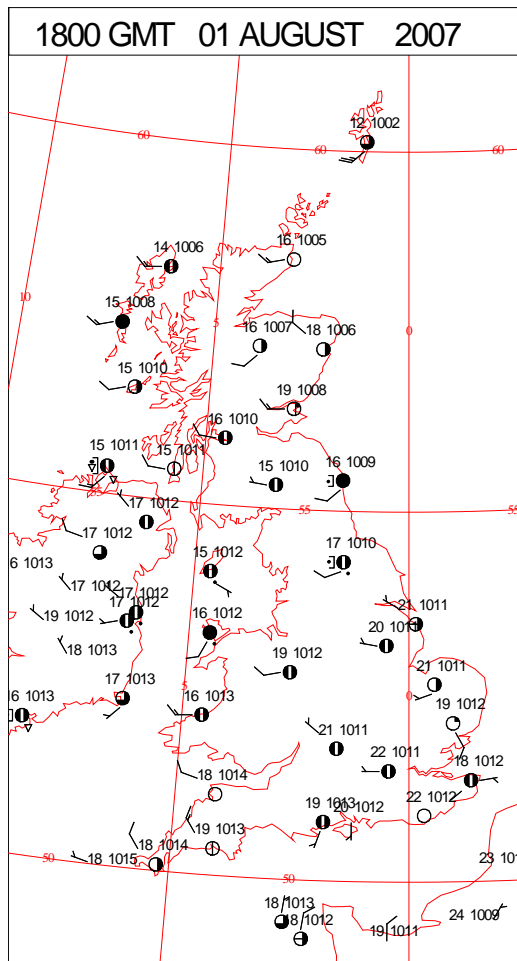

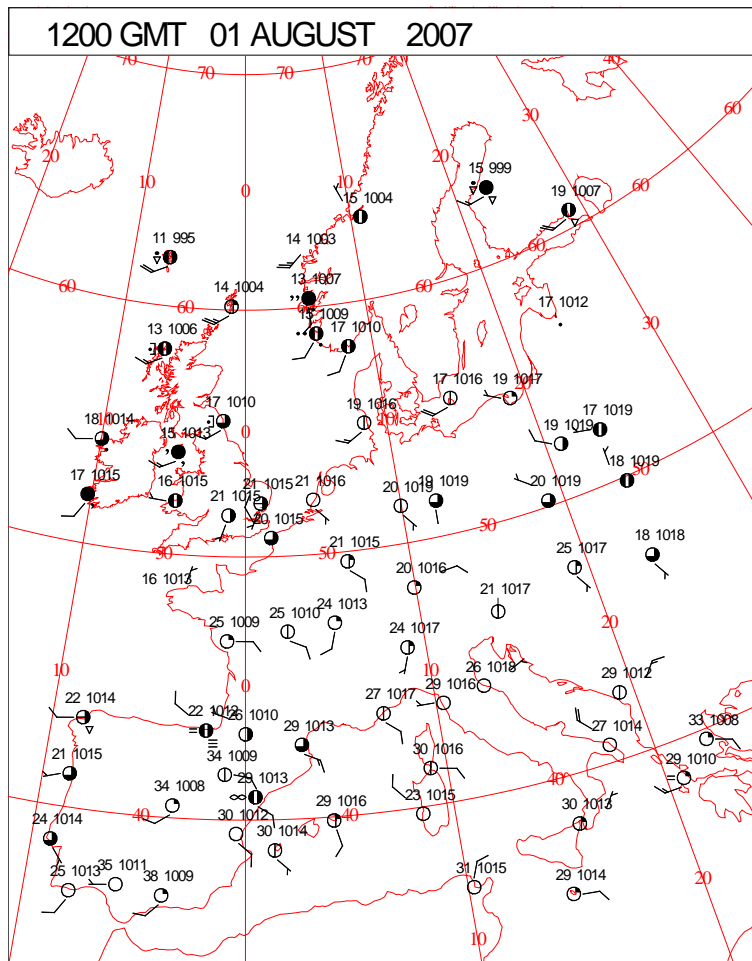

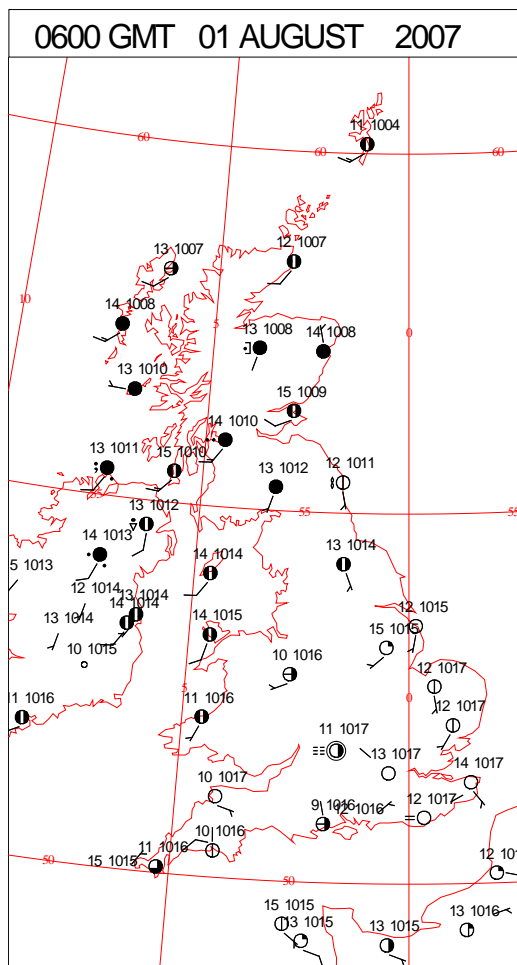

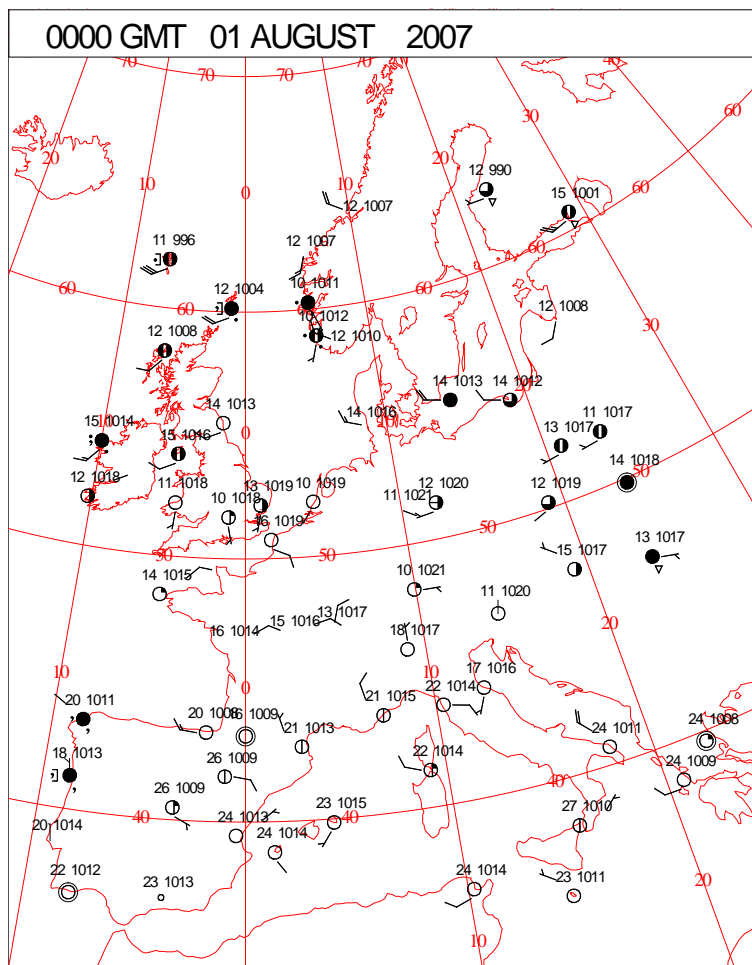

Species and their symbols:

SURFACE REPORTS

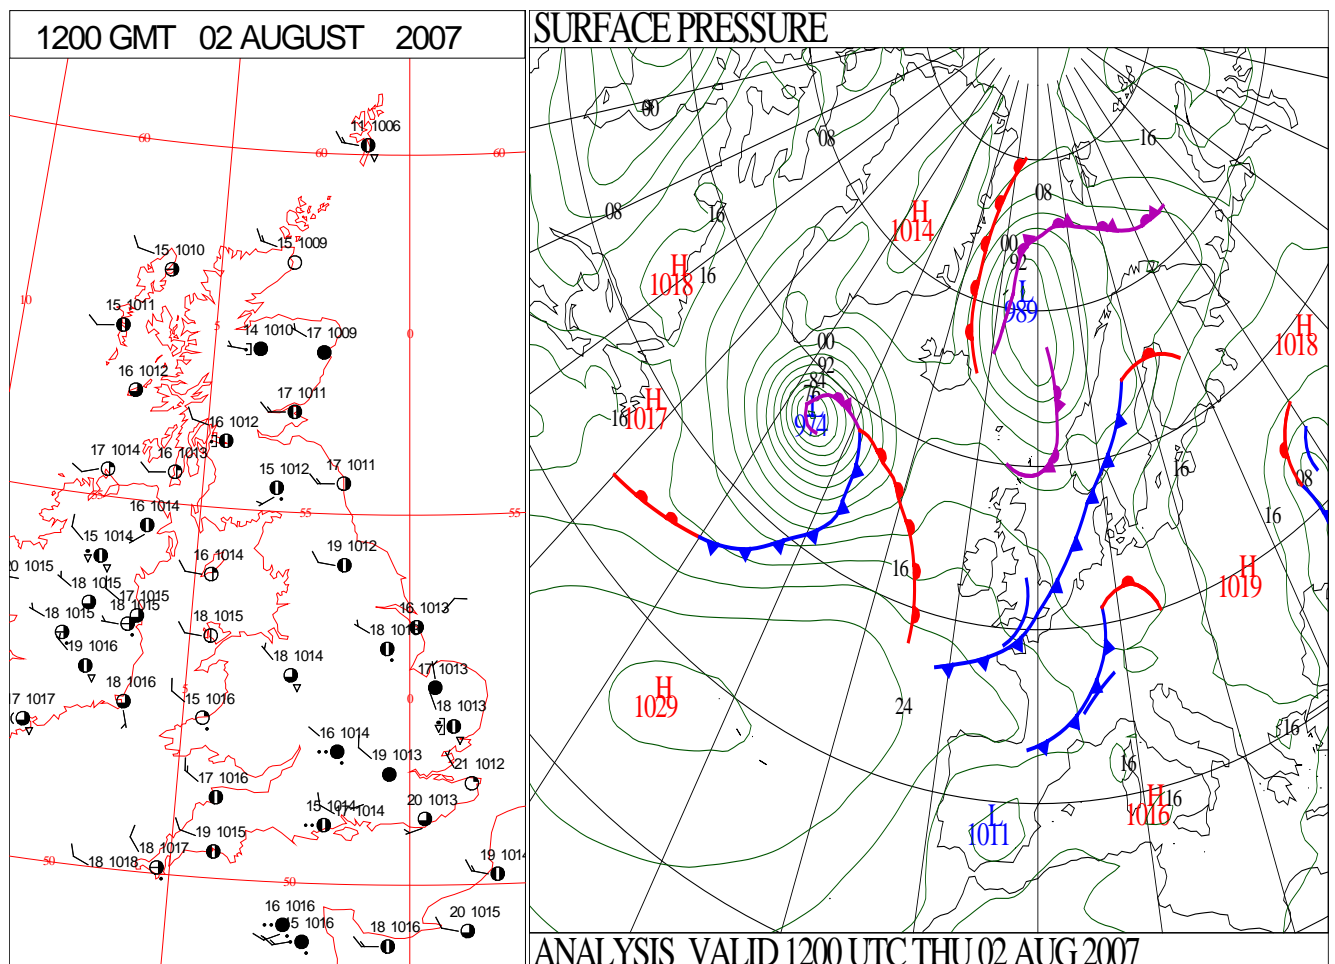

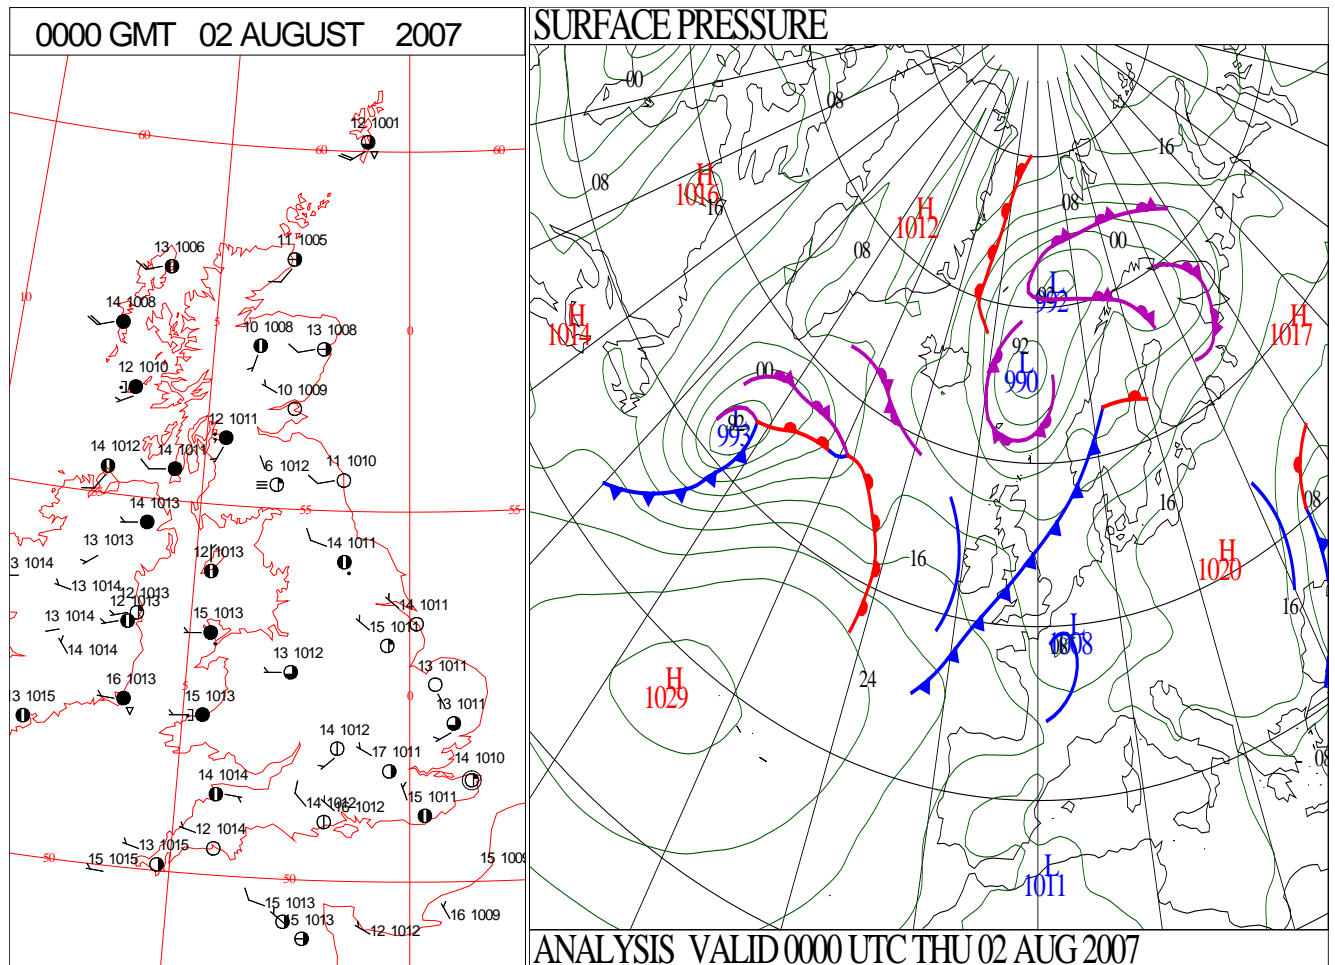

SIGNIFICANT WEATHER

0600 GMT 01 AUGUST 2007	SIG WEATHER	1200 GMT 01 AUGUST 2007	SIG WEATHER	<p>Summary of UK Weather for Wednesday 01 August 2007. England and Wales remained dry during the morning with most places experiencing clear skies, especially in the Southeast. A band of mainly light rain and drizzle stretched from Aberdeen to Edinburgh and into Northern Ireland at the start of the period. This progressed southeastwards during the morning, reaching the Scottish/English borders by mid-morning, hovering over the Borders until mid-afternoon and then reaching Newcastle-upon-Tyne and the far northwest of Wales by late-afternoon. By this time, the band of rain had become quite narrow and was weakening in intensity, leaving Scotland and Northern Ireland dry and bright, with skies continuing to clear. During the afternoon, isolated showers affected the central south, with only very small amounts of rainfall experienced. During the evening and into the night the south of England and Scotland remained dry and relatively clear, with northern and central England staying cloudy with light rain and drizzle. Temperatures remained near average for the time of year.</p> <p>EXTREMES Highest Maximum: 25.0 Northolt, Greater London Lowest Maximum: 15.0 Fair Isle, Shetland Lowest Minimum: 6.4 Pembrey Sands, Dyfed Lowest Grass Minimum: 2.2 Dishforth Airfield, North Yorkshire Most Rain: 7.8 Eskdalemuir, Dumfriesshire Most Sun: 12.3 Isle Of Portland, Dorset</p>

SIGNIFICANT WEATHER

0600 GMT 02 AUGUST 2007	SIG WEATHER	1200 GMT 02 AUGUST 2007	SIG WEATHER	<p>Summary of UK Weather for Thursday 02 August 2007.</p> <p>A narrow and weak front slowly edged southeastwards during the early hours of the morning, bringing patchy rain and low cloud across Wales and northern England. As the day dawned, the rain became more organised giving heavy downpours across South Wales and southwest England. The main band of rain continued south-eastwards and slowly moved into the English Channel through the afternoon, but isolated heavy showers followed on behind across southern England.</p> <p>Meanwhile, across Northern Ireland and northern Scotland, showers continued on and off throughout much of the day. However, these were generally light and moved through fairly swiftly on a steady westerly breeze. The best of the weather was reserved for southern Scotland and northern England, where most areas had a fine, dry and bright day.</p> <p>By the evening, most of the cloud and rain had cleared southern parts and many areas enjoyed a dry and sunny evening with clear blue skies.</p> <p>The temperatures were at, or a little above, the seasonal average across much of the UK.</p>

SIGNIFICANT WEATHER

0600 GMT 03 AUGUST 2007	SIG WEATHER	1200 GMT 03 AUGUST 2007	SIG WEATHER	<p>Summary of UK Weather for Friday 03 August 2007.</p> <p>It was an east–west split across the UK as an Atlantic weather system moved into western parts through the early hours of the morning, with an associated warm front bringing low cloud, fog and drizzle to western coasts and hills. Meanwhile, many sheltered eastern areas started the day chilly but with clear blue skies.</p> <p>As the day wore on, most southern and eastern parts of England and Wales held on to the dry weather with plenty of warm sunshine. but western parts stayed grey and murky with low cloud clinging on for much of the day.</p> <p>Further north, for Scotland and Northern Ireland, the day deteriorated with a cold front quickly following on behind during the latter part of the morning and into the afternoon. This brought more persistent rain which became heavy at times. The Isle of Skye received over 35mm of rain in the 12 hours from midday.</p> <p>As a result there was a stark contrast in the temperatures. In the southeast, temperatures rocketed to above average values, whilst northern and western areas were below average.</p>

SURFACE REPORTS

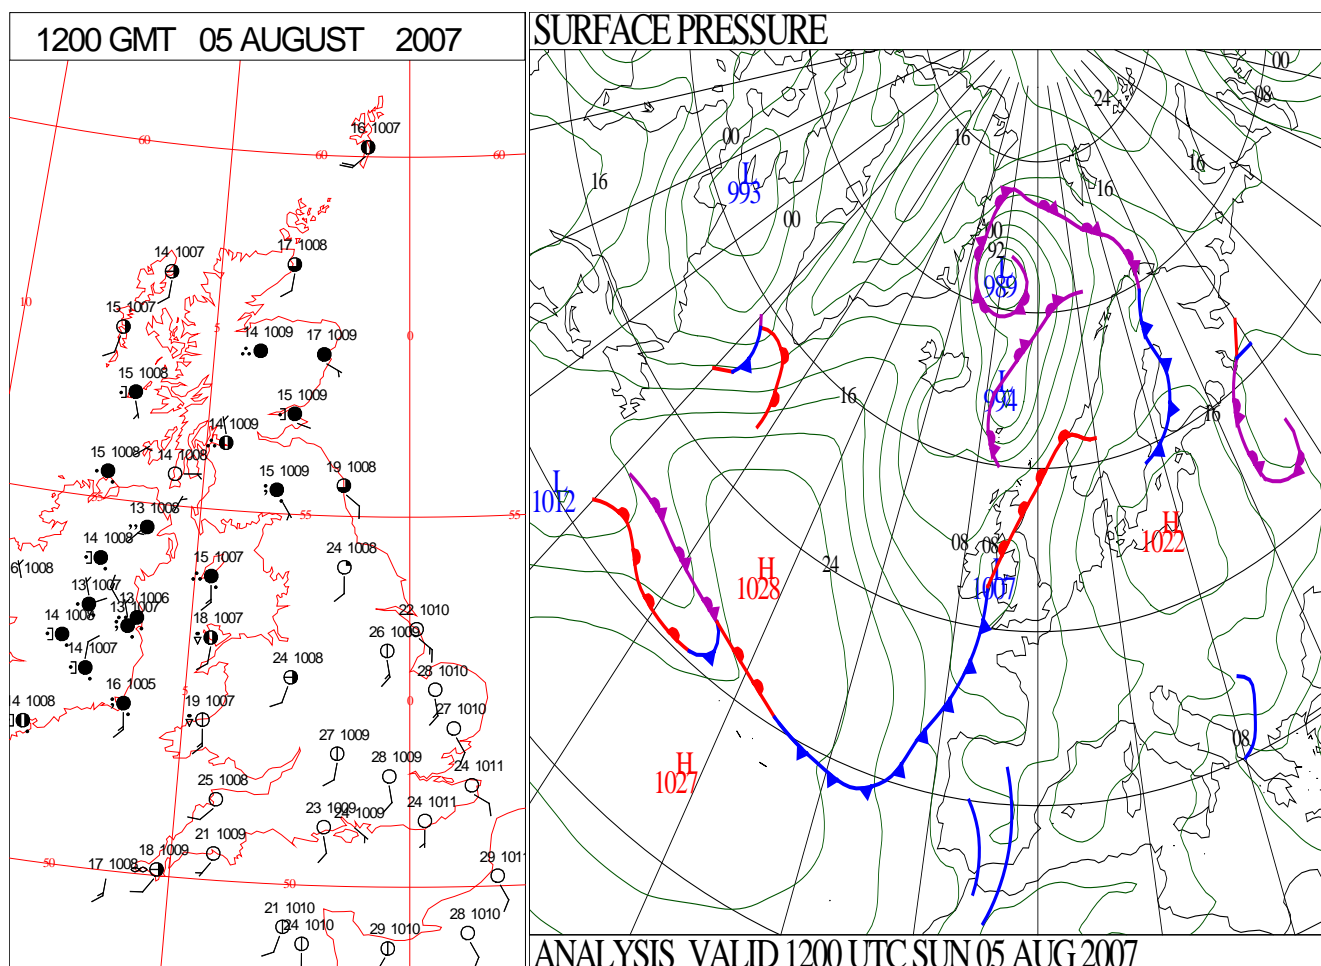

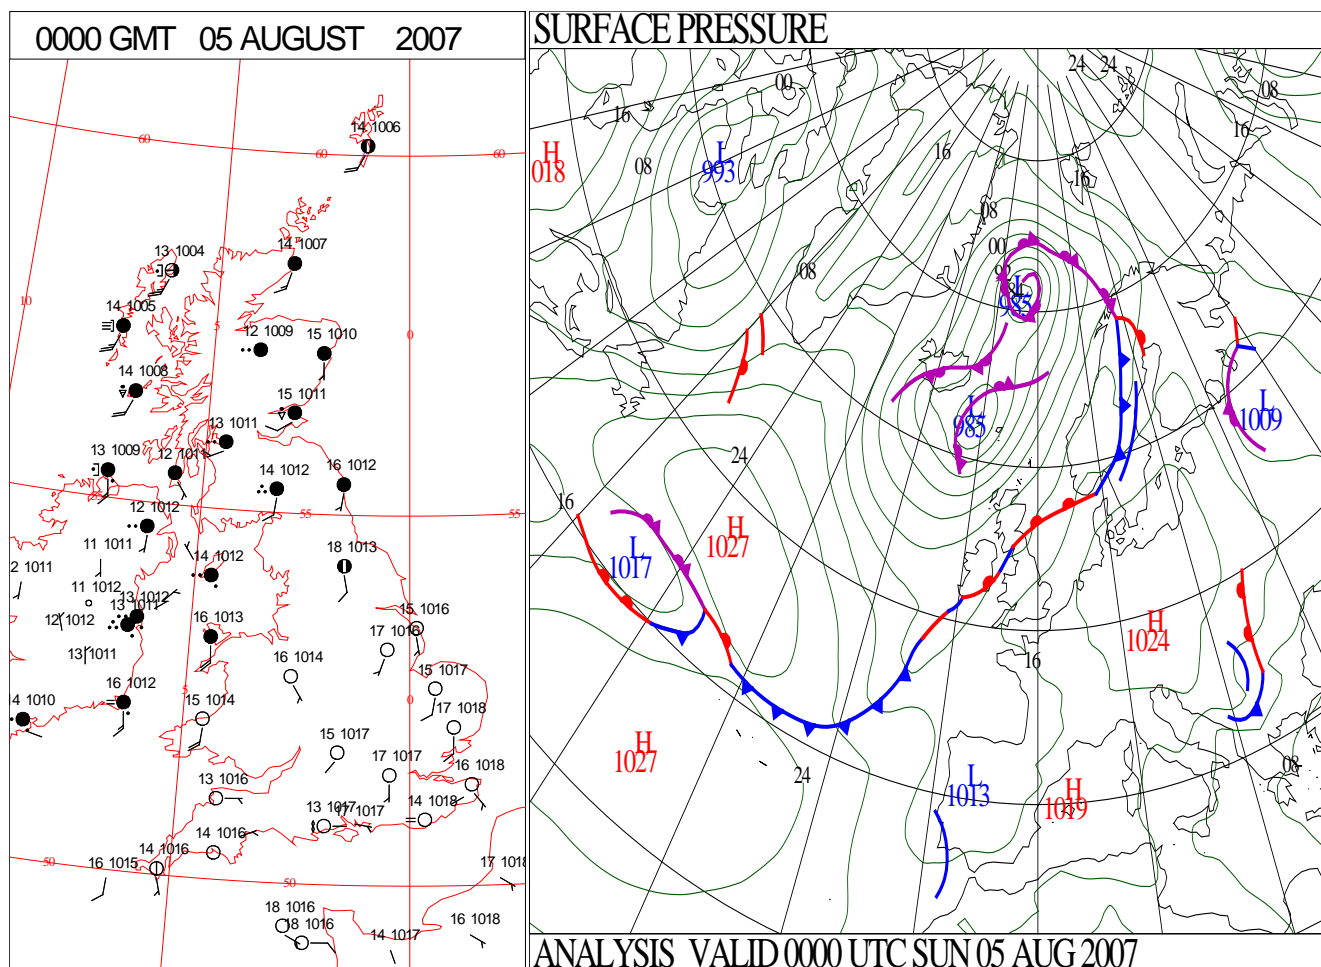

SIGNIFICANT WEATHER

0600 GMT 04 AUGUST 2007	SIG WEATHER	1200 GMT 04 AUGUST 2007	SIG WEATHER	<p>Summary of UK Weather for Saturday 04 August 2007.</p> <p>High pressure finally allowed southern parts of the UK to enjoy a taste of summer. Low cloud burned away to leave much of southern England, the south and east Midlands and East Anglia with a sunny afternoon. Temperatures quickly responded and reached the low to mid-twenties Celsius, and up to 27 °C in London.</p> <p>For Wales and northern England, a waving frontal system resulted in a very different day. Skies were rather cloudy, and across western coasts and mountains some patchy rain was observed. Due to mountain upslope effects, Capel Curig in Snowdonia picked up nearly 50mm of rainfall in 12 hours. To the east of high ground, some sunny spells developed and it became warm across northeast England and east Wales.</p> <p>North of this frontal system, western Scotland and Northern Ireland had a relatively dry day with some bright spells, although it was cooler. However, towards evening as the front began to return northwards, more persistent rain affected these areas. Eastern Scotland managed to escape the wet conditions, and there were some pleasant sunny spells with temperatures close to average.</p>

SIGNIFICANT WEATHER

0600 GMT 05 AUGUST 2007	SIG WEATHER	1200 GMT 05 AUGUST 2007	SIG WEATHER	<p>Summary of UK Weather for Sunday 05 August 2007.</p> <p>Overnight there was a north-south split in the weather experienced across the country. Scotland, Northern Ireland and parts of northern England were cloudy with outbreaks of rain, which was attributed to a frontal system pushing in from the west. The cold front edged slowly eastwards bringing cloudier skies to Wales and the southwest of England by mid-morning, before a narrow band of rain edged in during the afternoon. Further south and east it was a dry, clear and warm night though misty in places. As a result of this, central and southeastern parts of England started the morning with clear skies. Temperatures shot up markedly in these areas, resulting in the warmest day of the year for many. Further north in Scotland the rainfall lingered for most of the day and was persistent and heavy at times. Daytime temperatures were well above average in central and southern parts of England, whereas, they were cooler and below average in places further north affected by the cloud and rain.</p>

SIGNIFICANT WEATHER

0600 GMT 06 AUGUST 2007	SIG WEATHER	1200 GMT 06 AUGUST 2007	SIG WEATHER	<p>Summary of UK Weather for Monday 06 August 2007.</p> <p>A largely cloudy and dry night with clearer skies in the South East. There was rain overnight in Scotland with some heavier and thundery outbreaks across the east. A narrow band of light rain moved eastward across southern England overnight. Elsewhere there were showers, particularly in the southwest and across Wales, which became heavier across the Snowdonia region during the morning. Rain pushed into Northern Ireland during the morning and persisted through most of the day with heavy and thundery outbreaks at times. Heavy rain fell in northwest Scotland during the afternoon and the evening, and severe weather warnings were issued for the Highlands and Eilean Siar. There were sunny spells with scattered showers elsewhere, these becoming heavy and thundery along a line from Cornwall to Hampshire and in a band across the north Midlands. Winds were moderate throughout the day over much of the country. However, stronger winds were experienced across Northern Ireland and in northwest Scotland where gusts of up to gale force were recorded. Temperatures were generally close to or above average in southeast England and below average elsewhere.</p>

SIGNIFICANT WEATHER

0600 GMT 07 AUGUST 2007	SIG WEATHER	1200 GMT 07 AUGUST 2007	SIG WEATHER	<p>Summary of UK Weather for Tuesday 07 August 2007.</p> <p>The UK saw a clear start in the east, but with cloud and showers in the west. The northwest of Scotland saw some heavier rain first thing. During the day the cloud spread across the country but left some sunny spells in places.</p> <p>Thunderstorms occurred all day in the far south, spreading from west to east and as far north as Suffolk, intensifying as the day went on. Some high rainfall totals occurred across this area as a result, and also in northwest Scotland during the morning where the heavier rain persisted.</p> <p>The showers died out during the day, leaving clear skies everywhere except for the far north of Scotland and over southern parts of England where the heavy showers persisted along a south coast convergence line. Showers continued well into the evening across the southeast, and Wisley in Surrey recorded over 27mm in three hours from a slow-moving thunderstorm.</p> <p>Temperatures remained around the seasonal average.</p>

SURFACE REPORTS

SIGNIFICANT WEATHER

0600 GMT 08 AUGUST 2007	SIG WEATHER	1200 GMT 08 AUGUST 2007	SIG WEATHER	<p>Summary of UK Weather for Wednesday 08 August 2007.</p> <p>An area of high pressure nudged northwards across much of the UK, leading to mainly dry and settled conditions after a very chilly start in some places.</p> <p>The weather was more unsettled across the near continent though, with low pressure in charge, and this led to a few very early showers across the extreme southeast of England. These soon cleared to leave much of England, Wales and eastern Scotland dry with spells of sunshine. Temperatures were generally around average or a little below, although with light winds it felt pleasant. Through the late afternoon and evening, high cloud became extensive across eastern England.</p> <p>Across the extreme west of Scotland, together with Northern Ireland, there were some sunny spells but on the whole it was a cloudier day. This was due to a weak frontal feature which steadily decayed through the course of the day. The cloud was thick enough at first for one or two light showers, and later in the day, more showers moved into the Western Isles. Temperatures across northwestern areas, were close to, or a little below normal.</p>
1800 GMT 08 AUGUST 2007	SIG WEATHER	0000 GMT 09 AUGUST 2007	SIG WEATHER	<p>EXTREMES</p> <p>Highest Maximum: 23.1 Church Lawford, Warwickshire</p> <p>Lowest Maximum: 12.1 Fair Isle, Shetland</p> <p>Lowest Minimum: 3.2 Tulloch Bridge, Inverness-Shire</p> <p>Lowest Grass Minimum: -0.9 Church Lawford, Warwickshire</p> <p>Most Rain: 0.2 Charterhall, Berwickshire 0.2 Camborne, Cornwall 0.2 St Mawgan, Cornwall</p> <p>Most Sun: 13.6 Aberporth, Dyfed</p>

SIGNIFICANT WEATHER

0600 GMT 09 AUGUST 2007	SIG WEATHER	1200 GMT 09 AUGUST 2007	SIG WEATHER	<p>Summary of UK Weather for Thursday 09 August 2007.</p> <p>During the period, the UK was under the influence of a weakening ridge of high pressure with a band of frontal rain moving in from the west during the day. As the rain pushed into the ridge it became less organised, becoming more patchy and light. Most of the UK remained dry and bright, with the only exception being the west of Scotland and Northern Ireland. A band of light and drizzly rain approached the west of Northern Ireland by the morning, moving into the Islands and Highlands of Scotland by the middle of the day. By this time it was very broken, and rainfall associated with it had become very light. The broken band of rain stalled over western Scotland for the remainder of the day, with small hourly totals of rainfall reported throughout the day. The rest of the UK remained dry and bright, with the cloud in the southeast burning off during the middle part of the day as temperatures rose to be near normal for the time of the year.</p>

SIGNIFICANT WEATHER

0600 GMT 10 AUGUST 2007	SIG WEATHER	1200 GMT 10 AUGUST 2007	SIG WEATHER	<p>Summary of UK Weather for Friday 10 August 2007.</p> <p>After a chilly start to the morning with some rural fog patches, much of England and eastern Wales enjoyed a warm and sunny day with light breezes. For the rest of Wales, and the far northwest of England, thickening cloud brought a few spots of rain or drizzle. Little change for all these areas during the evening, albeit with a more general increase of cloud across northern England. As for Northern Ireland and Scotland, predominantly cloudy conditions prevailed throughout the day with occasional bursts of rain, though nothing too heavy. With a light to moderate southwesterly breeze blowing, northern and eastern parts of Scotland fared better with mainly dry and brighter weather. Maximum temperatures ranged from near normal in the north and west of the UK, to a degree or two above average across southern and eastern England.</p>

SIGNIFICANT WEATHER

0600 GMT 11 AUGUST 2007	SIG WEATHER	1200 GMT 11 AUGUST 2007	SIG WEATHER	<p>Summary of UK Weather for Saturday 11 August 2007.</p> <p>A clear start to the day for much of central and southern England and Wales with localised overnight mist and fog patches soon clearing in the morning. These areas remained dry and bright throughout the day with good periods of sunshine and a light south to southwesterly breeze. Across northern England there were also good periods of sunshine in southern parts and, although it was cloudier further north, most places remained dry during daylight. Over Northern Ireland and Scotland the day started cloudy with outbreaks of rain and drizzle with little change through the day. The cloud tended to extend further east through the day so during the afternoon Wales and western England tended to cloud over. Rain then extended to these parts by early evening with some heavier burst for a time across western Scotland, Northern Ireland and Wales. Maximum temperatures were slightly above normal in central and southern parts of the UK. Under the cloud and rain in Scotland and Northern Ireland temperatures were slightly below normal.</p>

SIGNIFICANT WEATHER

0600 GMT 13 AUGUST 2007	SIG WEATHER	1200 GMT 13 AUGUST 2007	SIG WEATHER	<p>Summary of UK Weather for Monday 13 August 2007. Overnight many central and eastern areas were dry with clear spells, while showers of rain affected western and northern parts. In the north these were heavy at times, merging into longer spells of rain across parts of western Scotland. Some lighter showers also affected southern parts of England. During the day, sunshine and showers occurred in all areas, rather light and scattered showers in the south, but heavy and prolonged in parts of the north with isolated thunder. Cloudier conditions spread to southwestern parts of the UK in the afternoon and, by the evening, the next frontal system was affecting the southwest of England, bringing outbreaks of rain. As the rainfall edged northeastwards across England and Wales the wind began to pick up and it became rather gusty, particularly across windward coasts. Daytime temperatures were generally below average for the time of year.</p>

SIGNIFICANT WEATHER

0600 GMT 14 AUGUST 2007	SIG WEATHER	1200 GMT 14 AUGUST 2007	SIG WEATHER	<p>Summary of UK Weather for Tuesday 14 August 2007. Overnight, rain affecting Wales and the South West of England, spread northeastwards reaching northern and southeast England by dawn. Some isolated showers affected other parts of the UK before dawn. During the day, the far north of Scotland was mostly dry and bright. Elsewhere, it was very cloudy and there was rain at times, some of which was heavy, especially across southern counties in the morning. Some heavy and thundery showers developed over eastern England during the afternoon and evening. It was generally windy across the south, with some large gusts recorded. Temperatures were generally below average owing to the cloud and rain.</p>

SIGNIFICANT WEATHER

0600 GMT 15 AUGUST 2007	SIG WEATHER	1200 GMT 15 AUGUST 2007	SIG WEATHER	<p>Summary of UK Weather for Wednesday 15 August 2007.</p> <p>Overnight a rain band moved across parts of north Wales and the southern half of northern England, with some heavier outbreaks persisting into the early morning. This feature gradually became lighter and patchier as it moved east during the day, with some brighter skies following. The rest of northern England and Scotland saw showers through the day, with the odd heavy one, but also with some sunnier spells in between. More persistent rain was seen at times in Shetland. The rest of Wales and England had a mixture of sunshine and showers. The showers were heavy and torrential at times, and organised into lines, starting out across the southwest, the Midlands and towards the north of East Anglia for much of the day, and developing further southeast during the afternoon. Heavy, thundery outbursts persisted in the southeast into the evening.</p> <p>Temperatures were generally around normal, but lower in areas which saw heavier and more persistent rain.</p>

SIGNIFICANT WEATHER

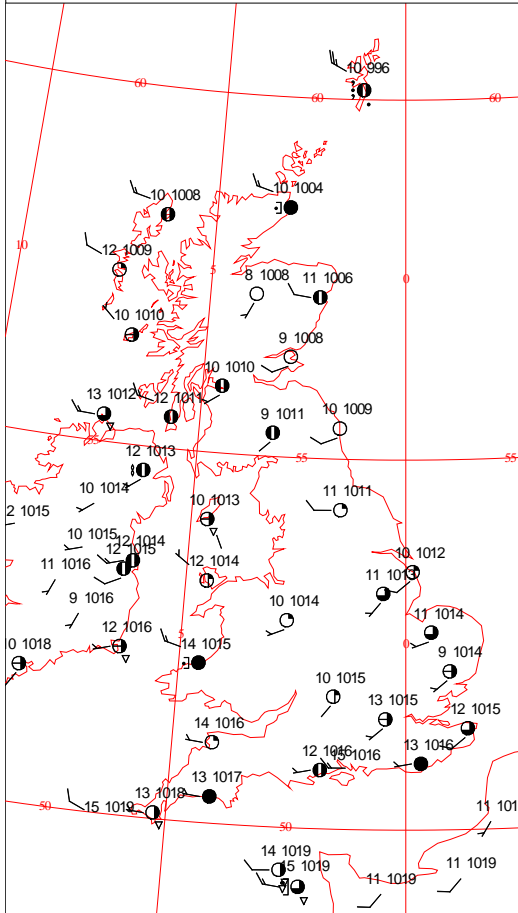

0600 GMT 16 AUGUST 2007	SIG WEATHER	1200 GMT 16 AUGUST 2007	SIG WEATHER	<p>Summary of UK Weather for Thursday 16 August 2007.</p> <p>An unusually deep area of low pressure for mid-August continued to move slowly eastwards to the north of Scotland, with a showery westerly flow continuing to influence the UK's weather. The showers were evident very early across west Wales, northwest England, western Scotland and Northern Ireland, merging to give more prolonged rainfall across some areas. Lancashire received particularly wet conditions through the day as showers piled in off the Irish Sea. By lunchtime, the showers developed more widely across the rest of the UK, and a few were heavy with occasional rumbles of thunder in northern areas. There were some sunny spells between showers, notably across South Wales where very few showers were witnessed during the afternoon. The exceptions to the showery regime were Shetland and the extreme north of Scotland, where more persistent, frontal rainfall continued to move slowly southwards. Temperatures across the UK were close to or slightly below average, but it felt a good deal cooler owing to the fresh westerly wind, which touched gale force in parts of northern and western Scotland.</p>

SIGNIFICANT WEATHER

0600 GMT 17 AUGUST 2007	SIG WEATHER	1200 GMT 17 AUGUST 2007	SIG WEATHER	<p>Summary of UK Weather for Friday 17 August 2007.</p> <p>During the day a weak ridge of high pressure gave way slowly to a region of low pressure approaching the UK from the Atlantic. Throughout the morning light showers affected regions in the west of the UK, particularly the region to the west of the Pennines. These showers drifted slowly east across the country, clearing the east coast by early afternoon to leave most of the country relatively dry during the middle part of the day. During the afternoon, thickening cloud and a band of rain associated with the approaching depression moved into Northern Ireland and western Scotland. This progressed eastwards during the evening into Wales and northwest England, reaching the Pennines by late evening and eastern counties during the middle of the night. The Channel Islands remained dry and bright throughout the day. Temperatures remained near or just below normal for the time of year.</p>

SIGNIFICANT WEATHER

0600 GMT 18 AUGUST 2007	SIG WEATHER	1200 GMT 18 AUGUST 2007	SIG WEATHER	<p>Summary of UK Weather for Saturday 18 August 2007.</p> <p>It was a wet day across the UK, with cloud and rain moving quickly into western areas during the early hours. By dawn rain had already engulfed much of Northern Ireland and had edged into western parts of Scotland, Wales and England. Eastern parts did enjoy some early brightness but the cloud quickly rolled in through the morning with rain following on not far behind. The heaviest of the rain was reserved for western upslopes of Scotland where its continuous nature gave totals of well over 38mm for several parts. The winds were also a big factor of the weather with gusts approaching gale force across exposed northwestern areas of the UK.</p> <p>The day ended on a drier note across western Scotland and Northern Ireland but the rain continued well into the night for many eastern areas.</p> <p>The southeast had the best of the temperatures with figures around the average value, but under the cloud and continuous rain in Scotland the temperatures were well below the average for the time of year.</p>

SIGNIFICANT WEATHER

0600 GMT 19 AUGUST 2007	SIG WEATHER	1200 GMT 19 AUGUST 2007	SIG WEATHER	<p>Summary of UK Weather for Sunday 19 August 2007.</p> <p>It was a cloudy and damp day for many areas of the UK. From the word 'go' persistent rain was already plaguing southern and eastern Scotland and northwest England, with over one inch of rain reported in just six hours across southern Scotland. Elsewhere the rain was more drizzly and showery in nature with low cloud hugging much of England and Wales.</p> <p>It was an improving picture across Scotland and northwest England through the day. The rain eased and cleared into the afternoon, and with the cloud breaking too, there were even some glimpses of sunshine breaking through. However, the opposite was so across southern parts. The drizzly showers quickly intensified across Lincolnshire, the Midlands, Norfolk and the Home counties, giving heavy, thundery downpours. These showers continued in Norfolk and Suffolk for the rest of the day, giving high rainfall totals. Elsewhere though, the showers slowly eased and faded away.</p> <p>With so much cloud and rain around the temperatures struggled and were a little below average overall. However, across some southern and eastern areas, temperatures peaked at around the average mark for the time of year.</p>

SURFACE REPORTS

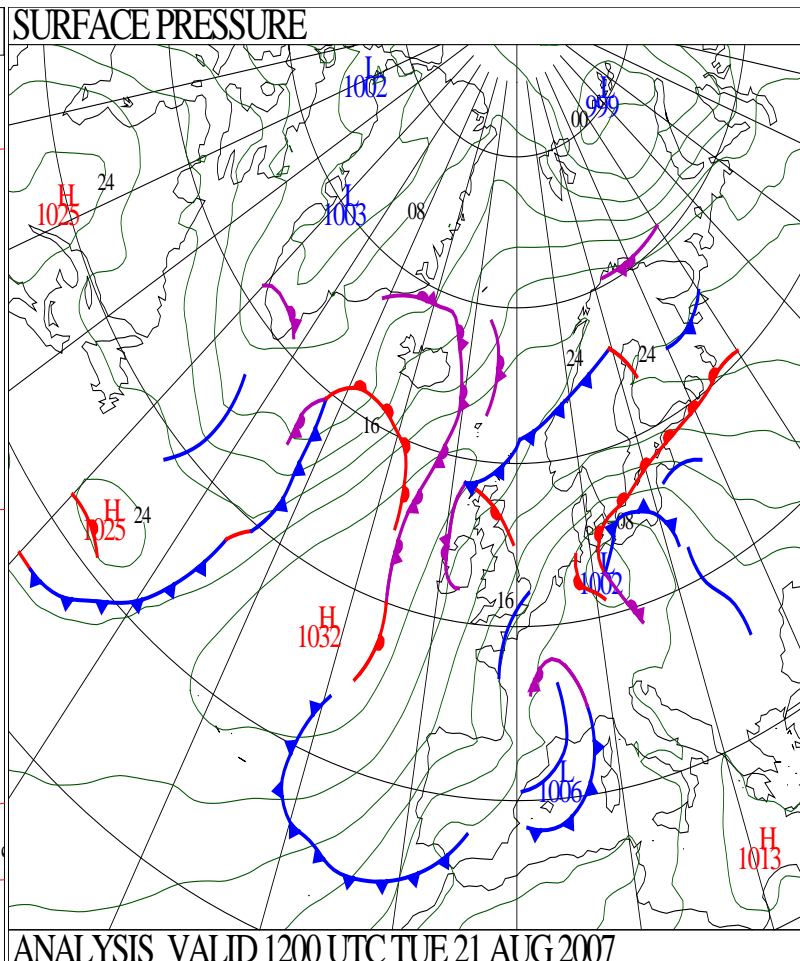

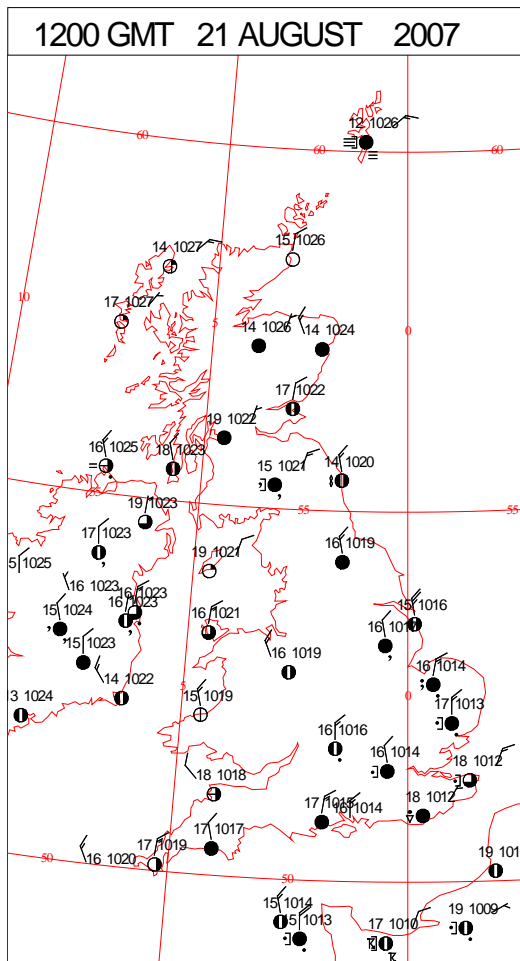

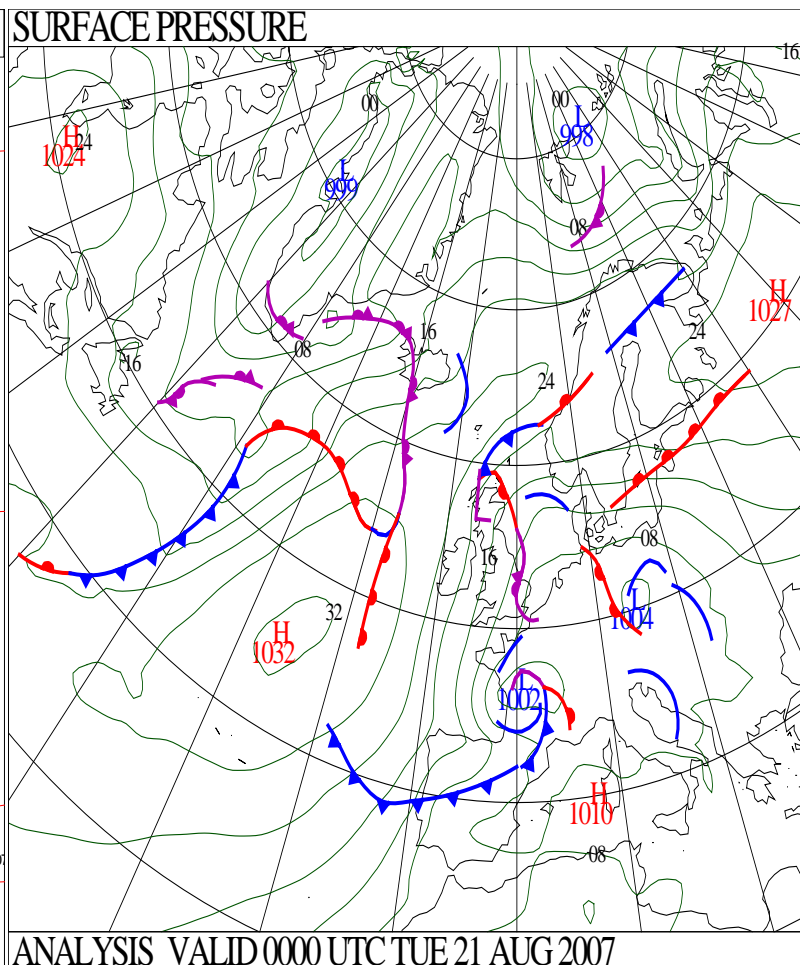

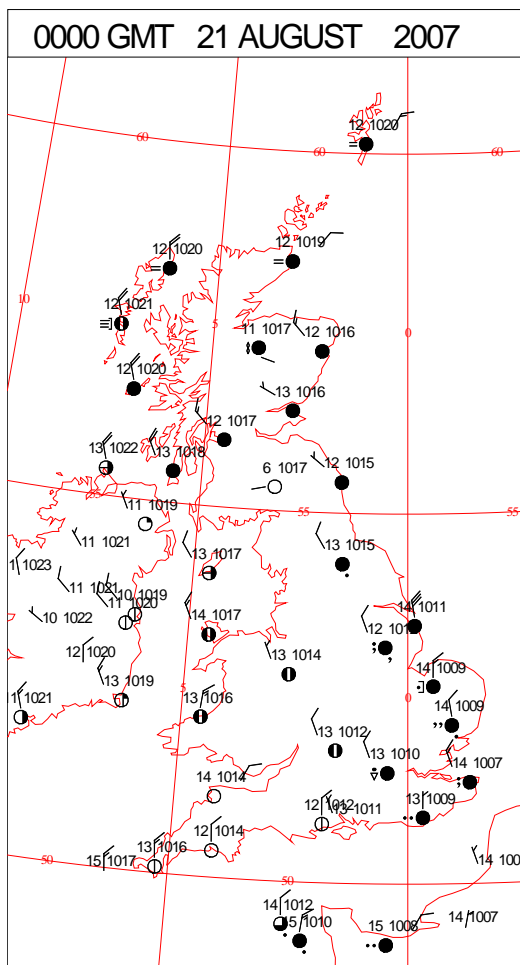

SIGNIFICANT WEATHER

0600 GMT 20 AUGUST 2007	SIG WEATHER	1200 GMT 20 AUGUST 2007	SIG WEATHER	<p>Summary of UK Weather for Monday 20 August 2007.</p> <p>Overnight a band of rain associated with an occluded front affected the south east of England. This edged eastwards into the North Sea although parts of the Norfolk coast clung on to this rainfall for most of the day, and it was heavy and thundery at times. At the same time the next weather system was moving in from the west bringing some heavy rain to Northern Ireland. This system quickly spread to west and south Wales by dawn and to much of southwest England during the morning. This rainfall was heavy and thundery at times before it eventually cleared into the English Channel by late afternoon. Heavy rainfall also spread to the Shetland Isles. Elsewhere most of the UK enjoyed a dry day and, despite a lot of cloud, some bright and sunny spells were experienced particularly in south west Scotland. However, with so much cloud and rain along with cool northerly winds, the temperatures struggled and were generally below average. In particular in the south of England temperatures were well below average.</p>

SIGNIFICANT WEATHER

0600 GMT 21 AUGUST 2007	SIG WEATHER	1200 GMT 21 AUGUST 2007	SIG WEATHER	<p>Summary of UK Weather for Tuesday 21 August 2007.</p> <p>Most places were dry overnight, with some clear spells. There were a few showers over England, particularly in the east. Some especially heavy and thundery showers affected Kent during the early hours of the morning. During the day most places remained dry, although there was some sunshine in the west, it was rather cloudy day for many. A scattering of light showers continued to affect parts of central and eastern England through the day. Heavy showers also continued to affect Kent and Sussex, with some large rainfall accumulations recorded. Most showers over England had died out by the evening, except in the far east, where further showers moved in from the sea. Maximum temperatures were generally below average towards the east of the UK, owing to cloud. Elsewhere temperatures were generally close to average.</p>

SURFACE REPORTS

SIGNIFICANT WEATHER

0600 GMT 27 AUGUST 2007	SIG WEATHER	1200 GMT 27 AUGUST 2007	SIG WEATHER	<p>Summary of UK Weather for Monday 27 August 2007.</p> <p>After the disappointing summer thus far, all eyes were on the August Bank Holiday weather. During the day, high pressure continued to dominate conditions to the west of the UK, and this translated into a dry day for much of England and Wales with some sunny spells, the best of these across the southwest. Temperatures were generally around average in the south, but a little below in parts of Wales.</p> <p>The weather was not summery everywhere, as a weak frontal system affected Scotland, Northern Ireland and northern England. This brought with it a good deal of cloud and occasional light rain. Much of the damp weather was concentrated over upland areas of northwest England during the morning, whilst a more coherent band of rain spread slowly southwards across northern Scotland. Through the afternoon, this patchy rain moved into parts of southern Scotland, allowing the north to become brighter. Elsewhere, the cloud sheet became increasingly broken into the afternoon with some sunny spells. Temperatures across many northern areas were around average for the time of year, but it was cooler in northern Scotland with a brisk northwesterly wind.</p>

SIGNIFICANT WEATHER

0600 GMT 31 AUGUST 2007	SIG WEATHER	1200 GMT 31 AUGUST 2007	SIG WEATHER	<p>Summary of UK Weather for Friday 31 August 2007.</p> <p>Overnight a cold front moved into the north of Scotland bringing a period of persistent and heavy rainfall at times. As this front moved south it fragmented and the rain became more light and patchy in nature. Elsewhere it was a mostly dry, albeit cloudy, night with one or two clear spells. Throughout the day there were some spots of rain in northwestern parts of England, Northern Ireland and northern Scotland, but on the whole it was predominantly dry with plenty of broken cloud and occasionally sunny spells. The best of the sunshine was experienced in the southeast of Scotland and the northeast of England. It was breezy during the day with gusts, in particular occurring to the east of the Pennines and across much of Scotland.</p> <p>Daytime temperatures were generally around average for the time of year, although perhaps a bit below under the more persistent cloud in western parts.</p>
1800 GMT 31 AUGUST 2007	SIG WEATHER	0000 GMT 01 SEPTEMBER 2007	SIG WEATHER	<p>EXTREMES</p> <p>Highest Maximum: 21.6 Leeming, North Yorkshire 21.6 Leconfield, Humberside</p> <p>Lowest Maximum: 12.4 Lerwick, Shetland</p> <p>Lowest Minimum: 8.3 Benson, Oxfordshire</p> <p>Lowest Grass Minimum: 4.3 Boscombe Down, Wiltshire</p> <p>Most Rain: 8.2 Ballypatrick Forest, Antrim</p> <p>Most Sun: 4.4 Jersey: Airport, Jersey</p>
