Daily Weather Summaries for January 2023

If you have any questions or feedback about this product or wish to obtain further data please contact the Met Office.

This document contains daily weather summaries for each day of January 2023. The Met Office National Meteorological Library and Archive holds a continuous record of daily weather summaries or daily weather reports from 1860, and these daily weather summaries form a continuation of that series.

The purpose of each summary is to provide an overview of the weather conditions across the UK on that day, with the historical emphasis mainly based on observations from surface network of weather stations, although the format has varied over the decades. While the emphasis remains on observations from the surface network, the current daily weather summaries supplement these by including satellite and rain-radar imagery to provide a more complete overview. The current format of the daily weather summaries is as follows:

1. Text summary of the main characteristics of the weather during the day, written by an operational meteorologist in the Met Office operations centre.
2. Table of daily extremes for the UK for key climate variables including temperature, rainfall, sunshine and gust speeds.
3. Overview of the synoptic situation at 00 and 12 UTC comprising: analysis charts showing the surface pressure pattern and associated weather fronts; North Atlantic and European infra-red satellite images showing cloud-cover; combined infra-red and rain-radar images of the UK; maps of wind speed and direction at 00 and 12 UTC; observations of pressure, wind speed and direction, cloud cover, air and dewpoint temperature at selected UK and European stations in data tables.
4. UK maps of key climate variables from observing stations including maximum, minimum and grass minimum temperature, rainfall, sunshine, gust speed and snow.
5. Further guidance notes

If you spot any data errors or omissions in this product please contact the Met Office.

Daily Weather Summary for Sunday 01 January 2023

This day's summary created 08/01/2023 03:03

Summary of the UK Weather for Sunday 01 January 2023

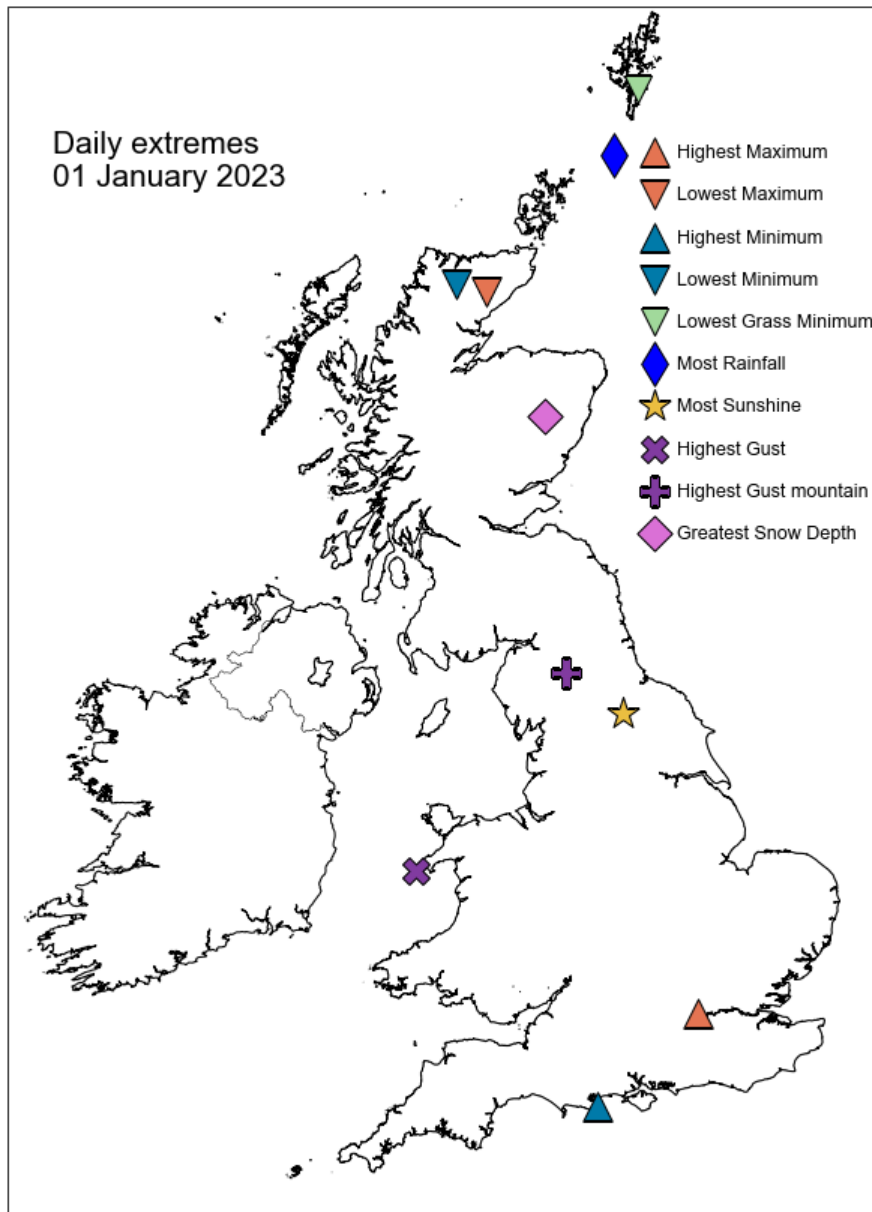

With a low pressure centre to the east of Scotland, it was a wet and unsettled morning across the region. Starting generally clear and dry for much of central England, scattered showers passed eastwards across the southeast in the early hours. An occlusion stalled over southern Scotland, bringing showers in the form of rain, snow, and sleet across Scotland, and slow-clearing fog formed here also. These conditions continued into the morning, with showers generally breaking up through to midday, however the southeast saw some heavy showers with associated sferics moving in from the west. Scattered showers persisted for much of the day across the UK. Late afternoon saw a thick rain band move in from the southeast, bringing persistent showers across the southeast of England, continuing into the evening. It remained mostly dry and clear through the evening elsewhere, with just some showers focussed on the north and west at times.

Summary of the UK Weather for Monday 02 January 2023

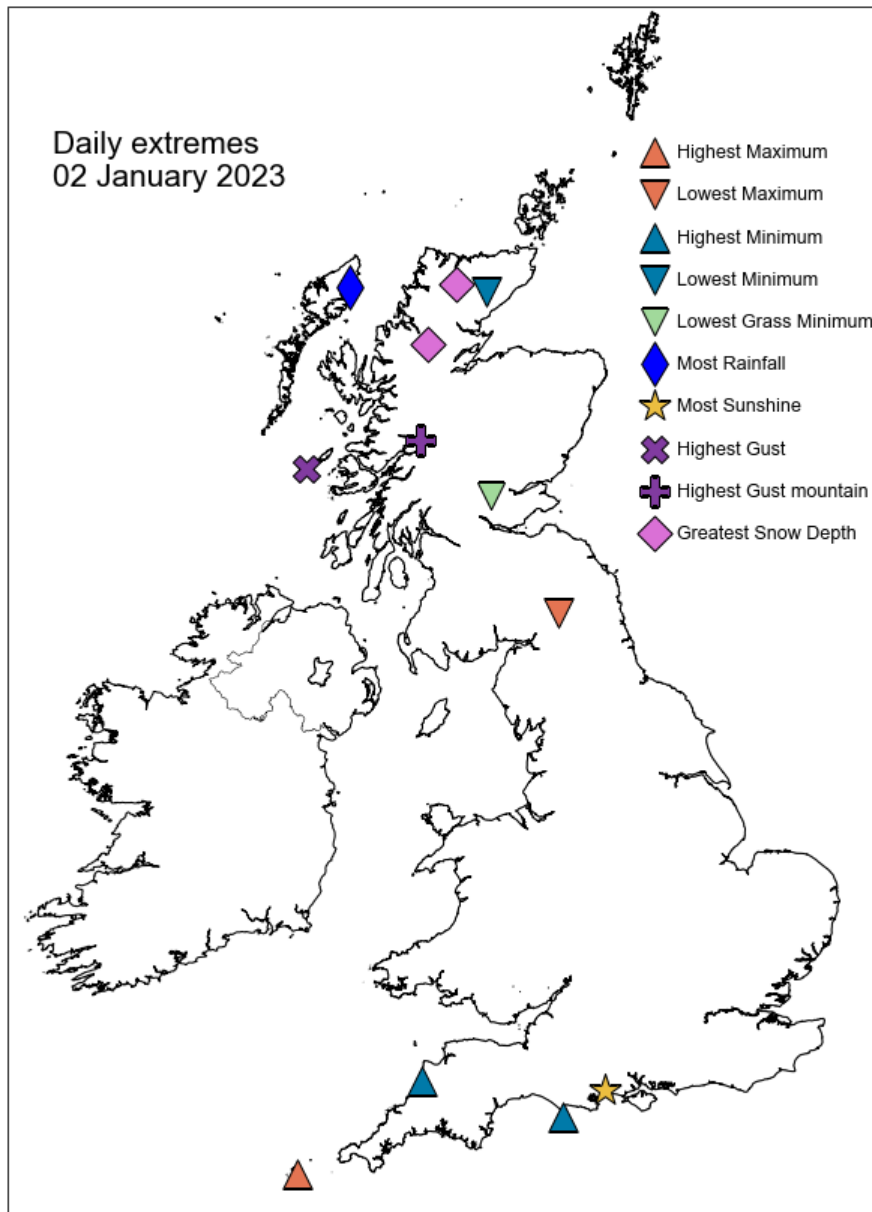

The UK saw a generally dry start to the day. Northern England and Scotland saw scattered showers through the early hours, these clearing swiftly. While a band of more organised, persistent showers cleared over the southeast into the Channel, making way for a drier morning. Dry, sunny conditions continued for most throughout the day with a few isolated showers persisting in western Scotland, falling wintry over higher ground due to a north/south temperature split. Clear conditions evened out this differential into the early evening as central and southern temperatures quickly dropped, bringing some widespread late-evening frosts.

This day's summary created 10/01/2023 03:03

Summary of the UK Weather for Tuesday 03 January 2023

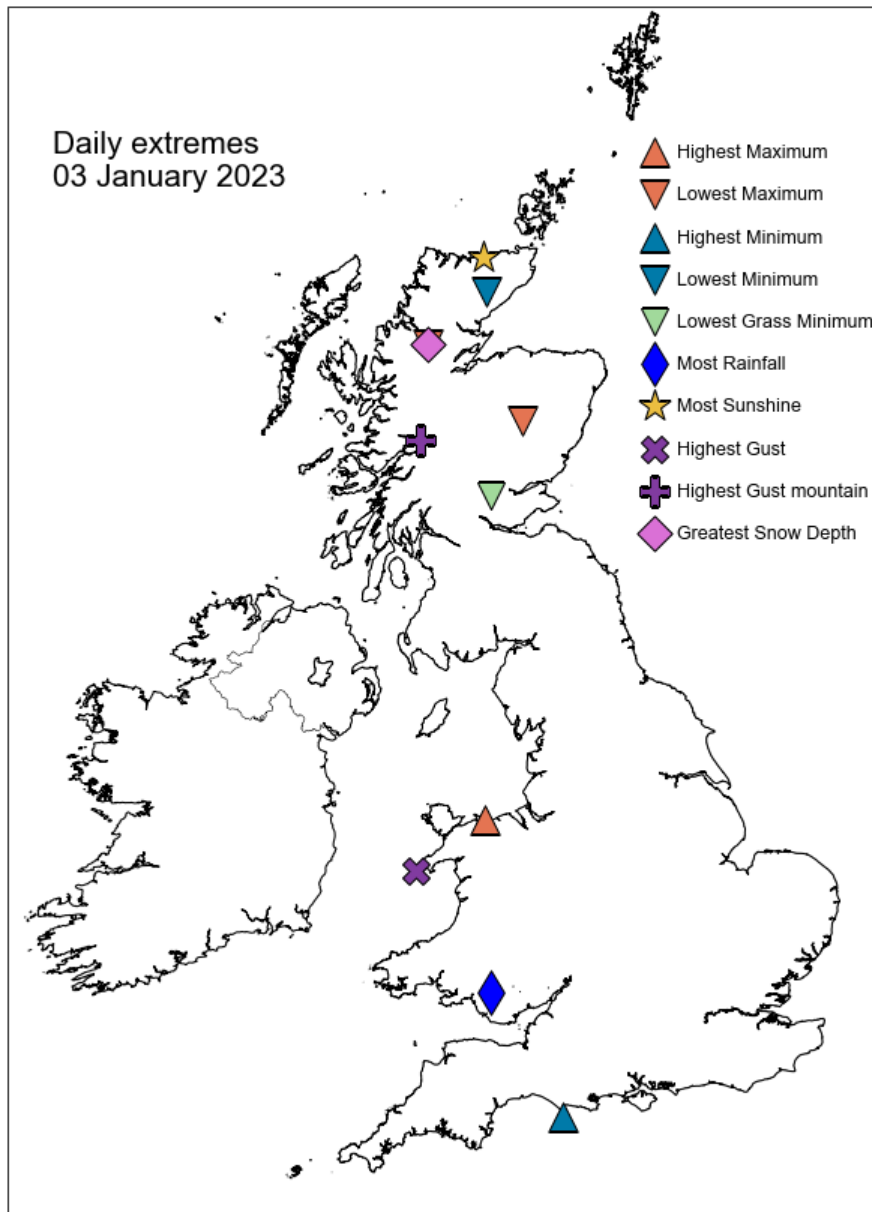

At midnight, the majority of the UK was dry with only a few showers in the southeast. Into the early hours, an occluded front moved eastwards across the country bringing showers to the southwest of England and Wales by 0200. As the front continued eastwards, a band of rain, locally heavy passed over the southwest, Wales and the western coasts of northern England and Scotland. Southerly winds were strong in coastal areas. This frontal system continued eastwards throughout the day. The initial band of rain cleared the east coast by 1000, however was closely followed by heavy rain and concentrated showers stretching from Scotland to the southwest that persisted through the rest of the day. Rain was particularly heavy in the north and west, with some signs of wintriness over Scottish highlands where temperatures remained average. Elsewhere, southerly winds brought in much milder Atlantic air, raising temperatures above average in southern and central areas.

Summary of the UK Weather for Wednesday 04 January 2023

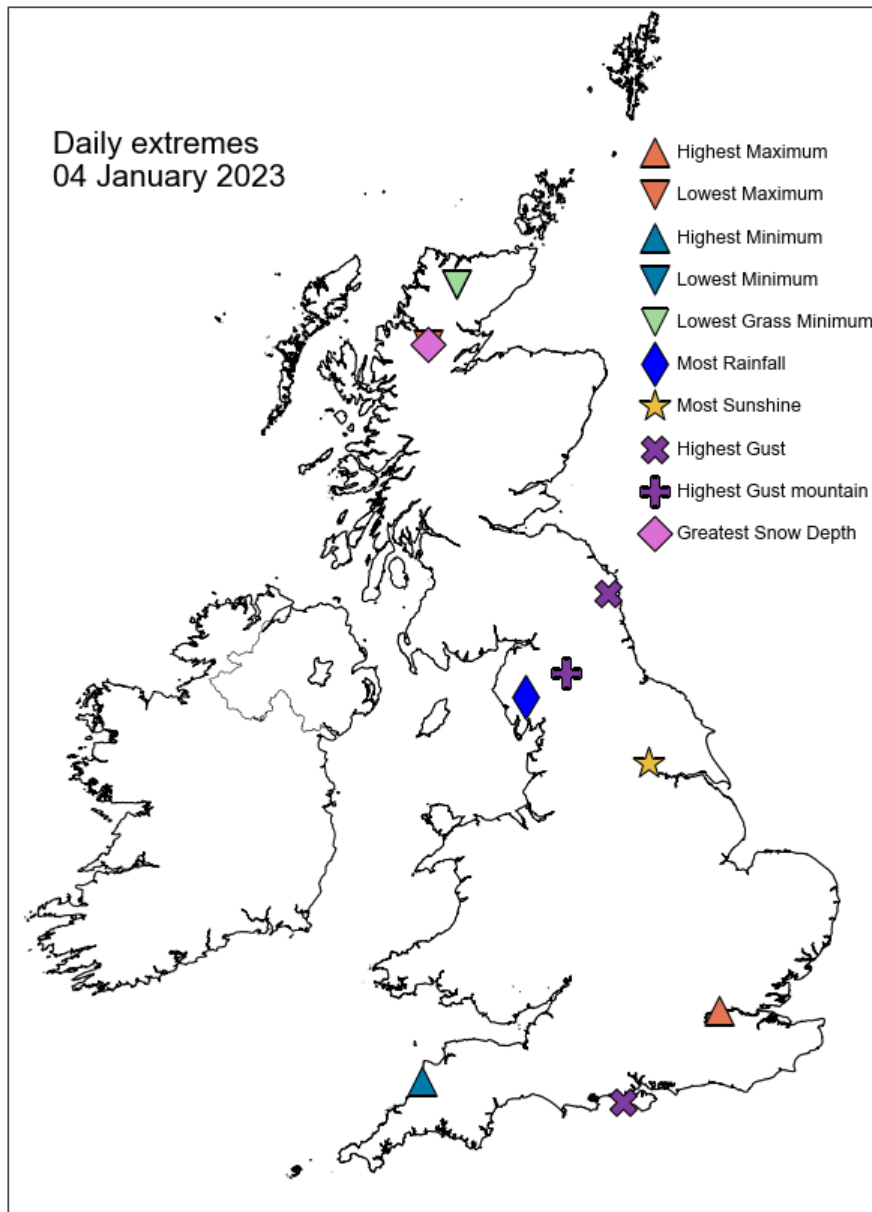

It was a wet night for much of Scotland with widespread rain that was heavy over higher ground. There was also a band of rain that spread from Wales into England through the early hours, easing as it reached eastern areas around 0400. Lighter rain followed from the west, as showers broke out over northern England, southern Scotland and Northern Ireland. Winds were strong and westerly for most, but lighter in Scotland. Wednesday was a drier day than previous for many. However showers remained in central northern England, southern Scotland and over central Wales for most of the day. The south was mostly dry throughout, although with the odd shower especially in the southeast. It was a cloudy day for many, with the east of the UK seeing the most of the clear weather. It stayed rather mild for the time of year, except in northeastern Scotland where it was closer to average.

This day's summary created 12/01/2023 03:03

Summary of the UK Weather for Thursday 05 January 2023

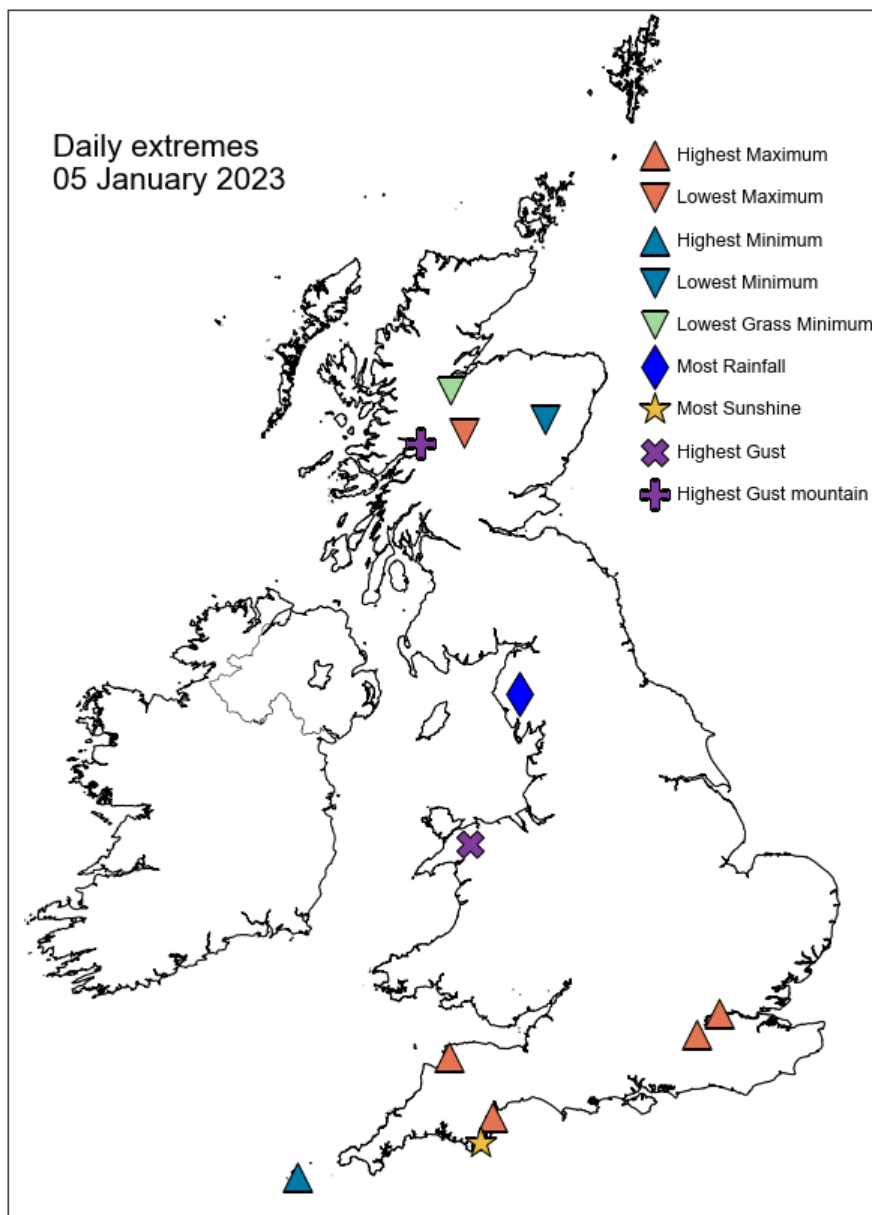

A much drier night for many than of late, with just the odd shower across northern England initially. Northern Ireland remained mainly dry but for a band of light showers that moved quickly through around 0230. By 0400 a band of drizzle moved into south Wales and southwest England, spreading slowly northeast towards dawn. Winds were moderate westerlies in the south, but lighter elsewhere. Much of the UK was inside a warm sector throughout the day, a pocket of warmer air behind a warm front and in front of a trailing cold front. This resulted in a milder day for much of the UK, with temperatures above average. It was a mainly dry day interspersed with showers for much of England and Wales, however in the late afternoon a deep low north of Scotland brought rain for much of the country. This brought very strong winds to the north of Scotland. Overnight the cold front made the main land, resulting in a spell of heavy rain passing from west to east, stretching from northern England to the southwest by midnight.

Summary of the UK Weather for Friday 06 January 2023

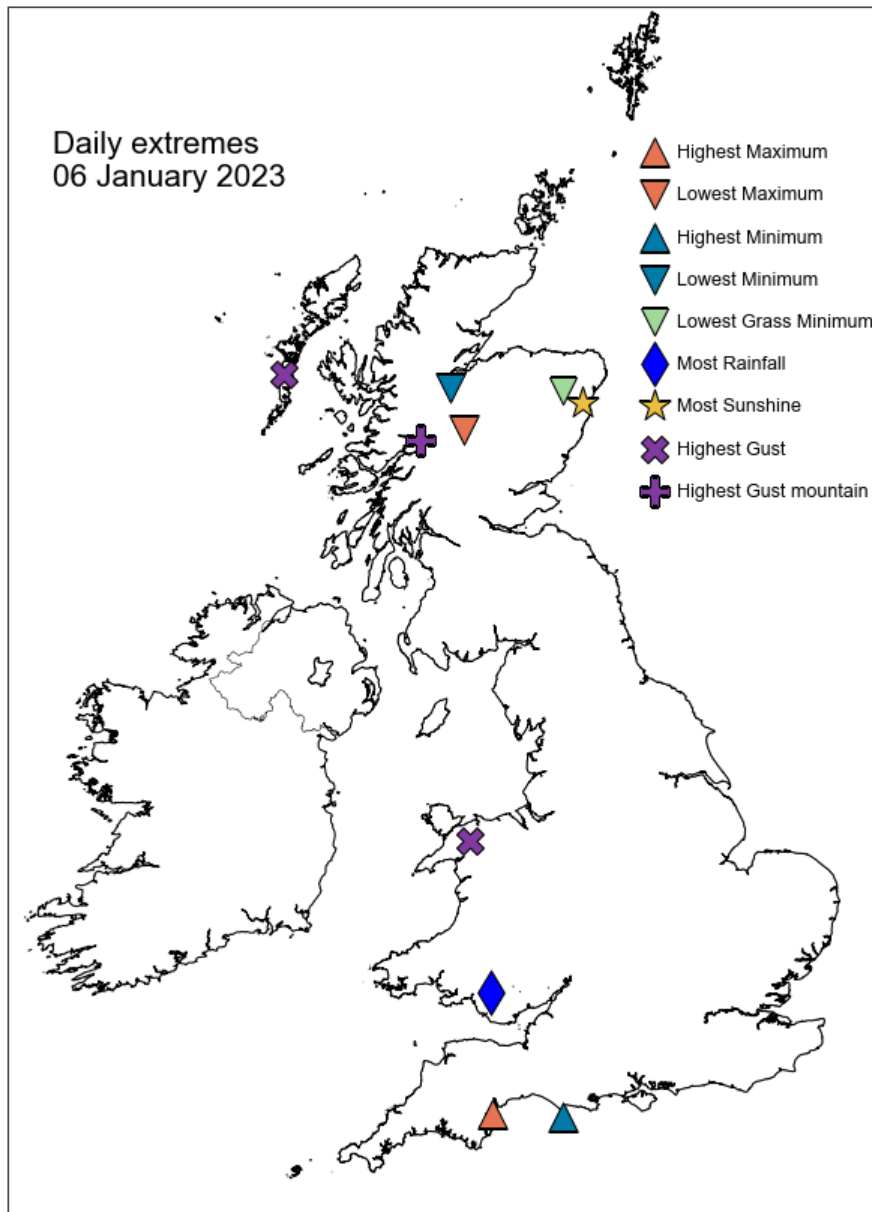

A cold front accompanied with a band of heavy rain moved eastwards across England throughout the early hours of the morning. By 0200, it had cleared the northeast coast and by 0400 has completely cleared the country leaving only a few scattered showers in northern England. The remainder of the country had mostly clear and dry conditions. Scotland had heavy showers mainly in the west early in the night, which transitioned to heavy rain in northern Scotland by 0200. Much of western Scotland was covered by rain or showers throughout. From the early morning, showers and rain affected the north of England and the highlands of Scotland. Around lunchtime, cloud and rain gradually decreased from these areas. However, the rain started across central and southwest England. Otherwise, dry, and clear conditions were widespread.

Daily Weather Summary for Saturday 07 January 2023

This day's summary created 14/01/2023 03:03

Summary of the UK Weather for Saturday 07 January 2023

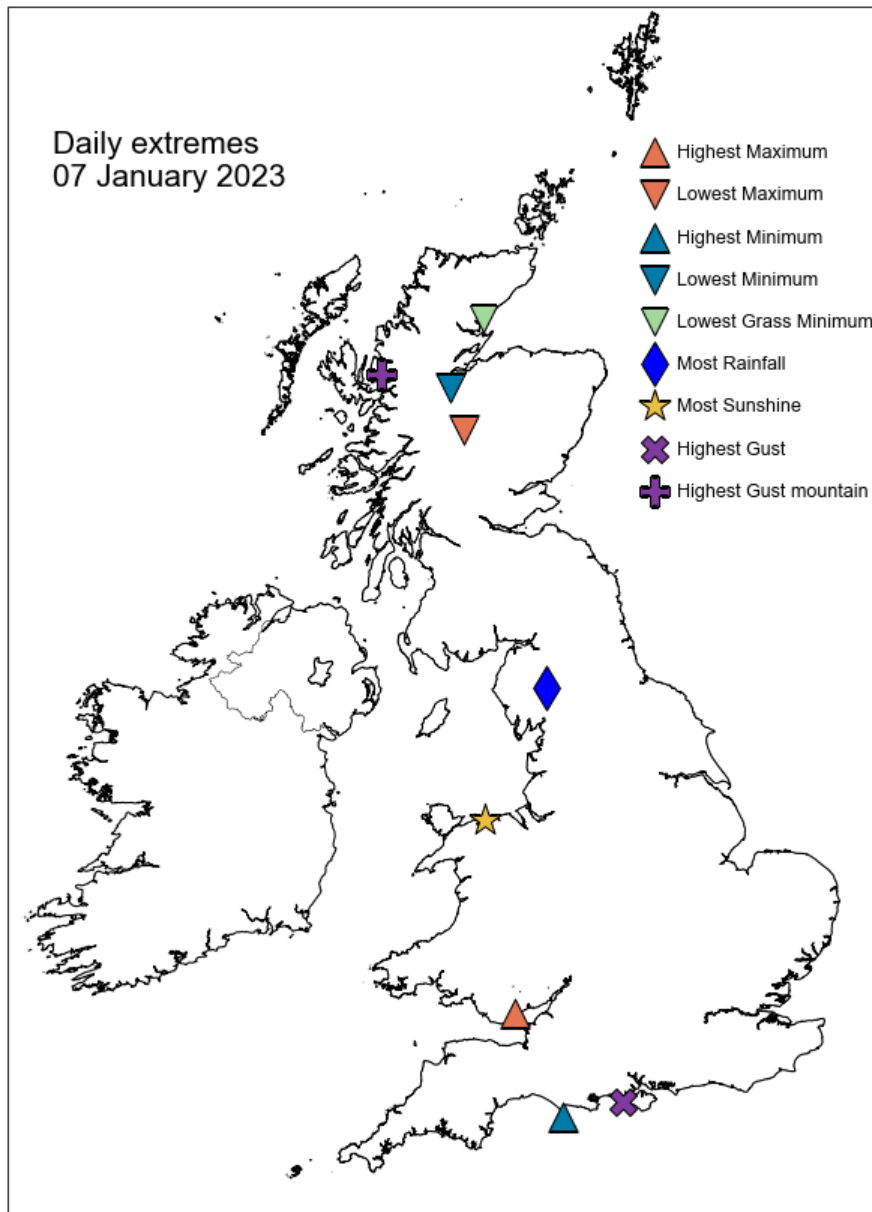

A deep depression off the west coast of Scotland brought heavy rain to western regions. This frontal rain progressed eastward through the period. The rain was accompanied by strong winds, reaching gale force in places. Temperatures were mild in the southeast, but cooler in the north. A cold front swept eastwards across the UK, bringing heavy rainfall and strong winds at times for much of the country. As a result of this, a yellow warning for rain was in place for parts of Wales and the southwest from midnight until 0900. This front had cleared the southeast by approximately 1500, however was followed by a series of occlusions that continued to bring rain and cloud into the evening. Between these fronts, conditions were generally dry with clear skies and lighter winds. Western coasts saw the strongest winds and heaviest rainfall. Over the course of the evening, much of central and southeastern England were dry, with showers primarily affecting the west, Northern Ireland, Wales, and Scotland. Temperatures were generally mild.

Summary of the UK Weather for Sunday 08 January 2023

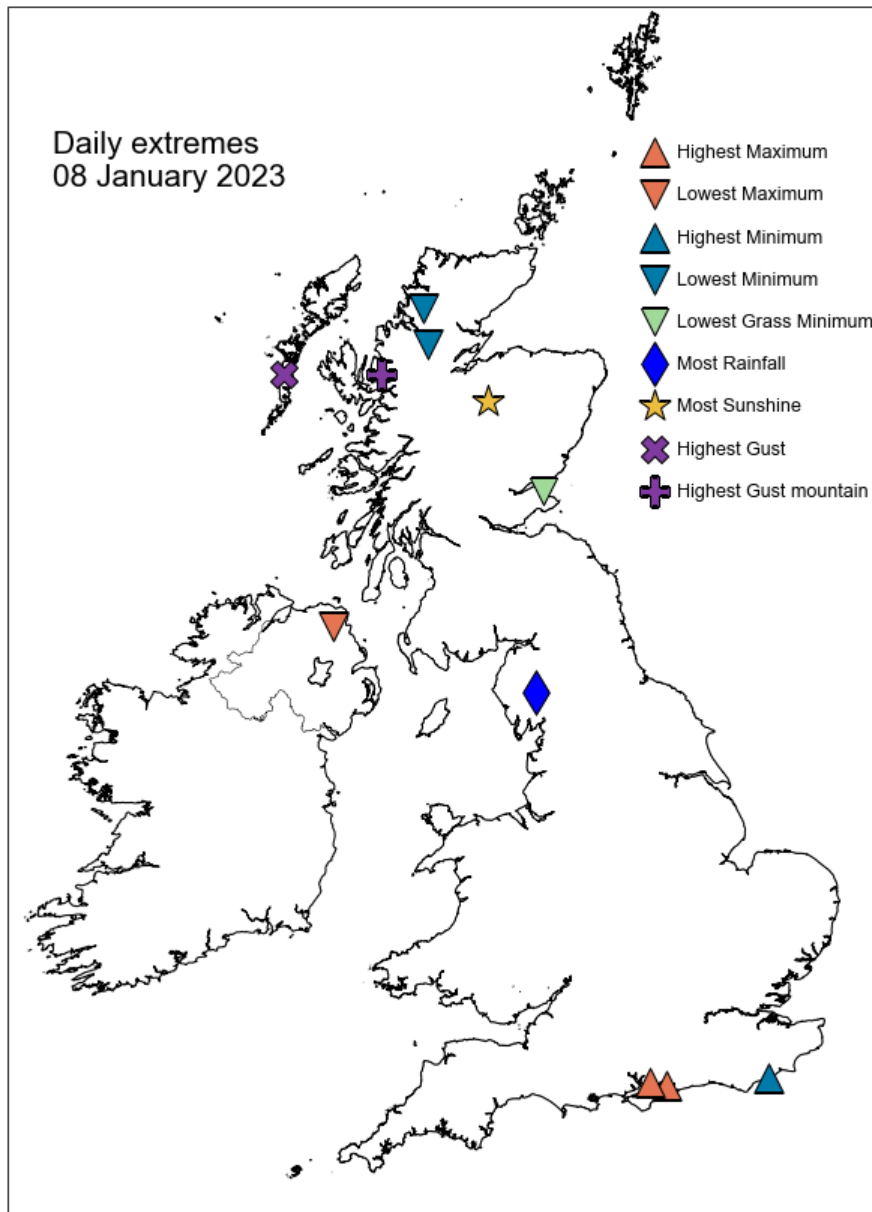

From midnight, cloud and wintry showers were observed in Scotland and north, central and southwest England. Showers and rain continued until early morning in the highlands of Scotland, and north and southwest England, but gradually decreased from central. Clear and dry conditions were experienced in remaining parts of the UK. A number of occluded fronts passed over the UK today bringing a number of bands of rain. In the morning, the west coast of northern England had heavy rain and the south and south west had heavy showers. These moved eastwards reaching the east coast and south east England by 1300. Following this a second band of rain and showers hit the west coast of England at 1700 once again bringing showers in the south and more continuous rain in the north which continued into the evening and overnight. The low pressure system sat just off the northwest coast of Scotland so rain was heavy for most of the morning. Into the afternoon the west coast of Scotland had heavy rain.

Summary of the UK Weather for Monday 09 January 2023

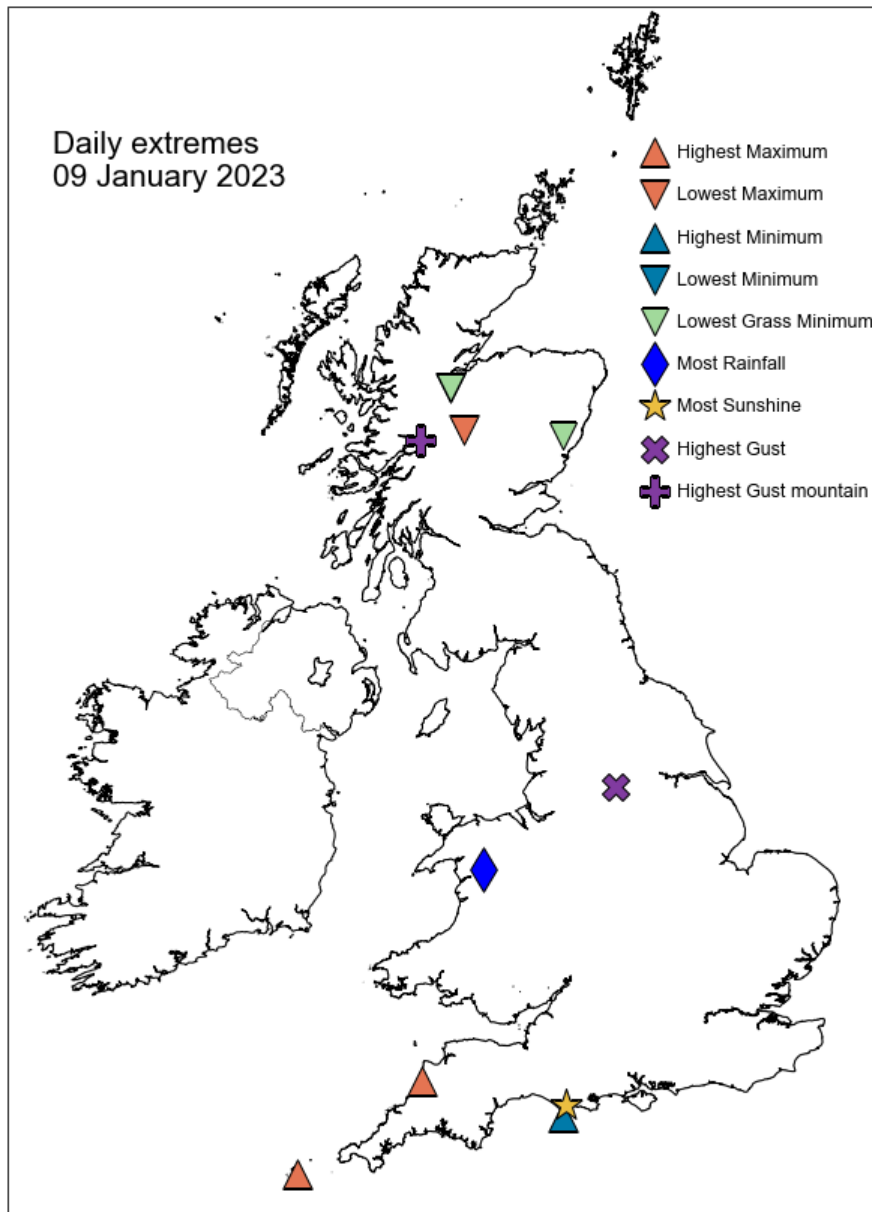

It was another showery and blustery day across the UK. Rain and cloud were prevalent across the Scottish Highlands to begin, while it was a showery start elsewhere in Scotland, and in northern, southern, and southwestern parts of the UK. Elsewhere saw mostly dry, cold, and clear conditions through the early hours. Showers and rain continued until early morning in Scotland, and southern and southwestern England, but eased in the north. Showers and coastal gusts dominated the west in the morning as the next occlusion reached the UK, these reducing throughout the morning in England leaving only scattered showers in central Wales, southwest England and the midlands by midday. In Scotland, however, showers became heavier and more persistent, and into the afternoon, spread southeastwards, affecting northern England by early evening in the form of showers. Elsewhere remained mostly clear and dry for much of the afternoon, and showers generally cleared by the evening, leaving a dry night for most. Southwesterly winds were strong in all areas, especially at coasts, throughout the day.

Summary of the UK Weather for Tuesday 10 January 2023

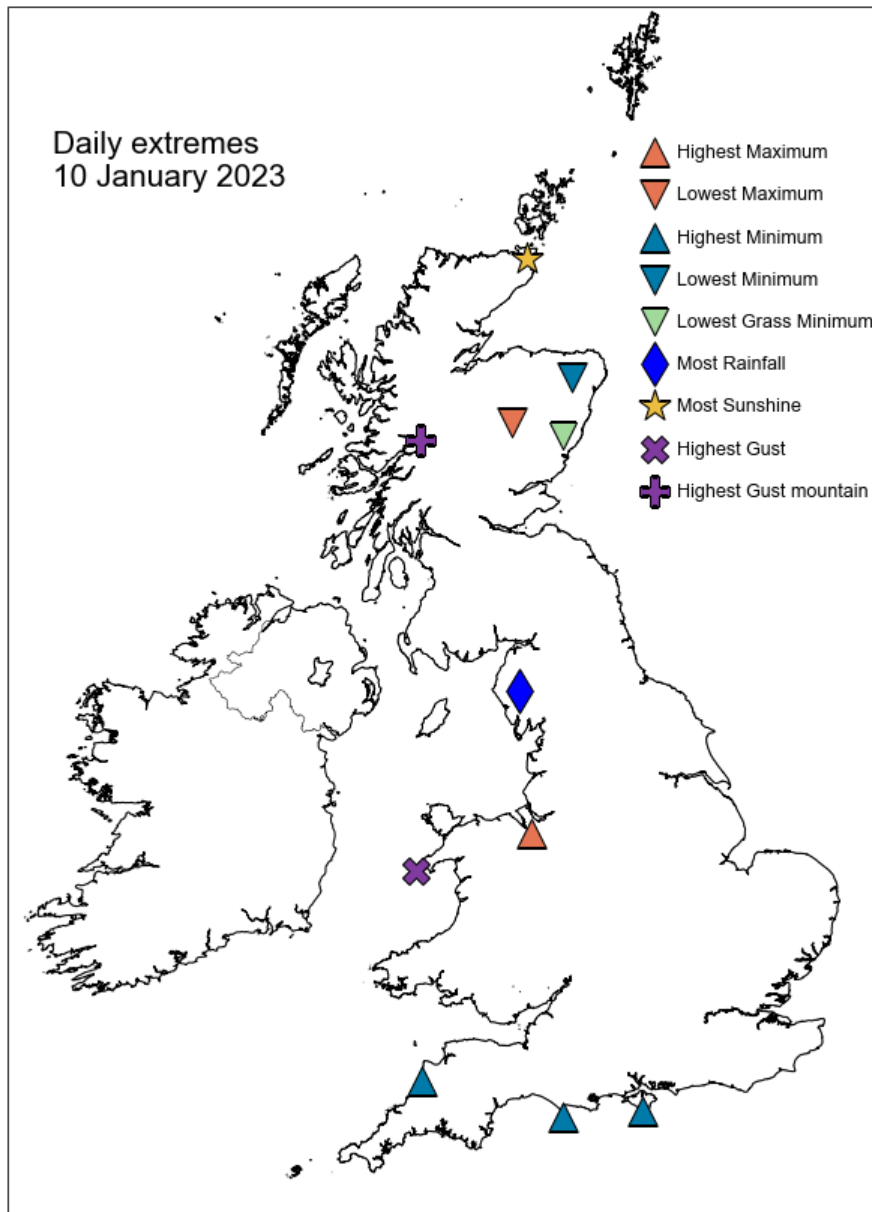

It was a showery start for Scotland, Northern Ireland, Wales and the southwest, with a deep low pressure to the north of the UK and a thick rain band edging in from the east. Continuing to move eastwards through the early hours, showers spread to central and northern parts towards dawn. It was a generally fine and clear start for many eastern areas. The thick band of rain continued spreading to all parts over the rest of the morning, heaviest over Wales and the southwest. This was followed by a slightly drier, albeit still cloudy, spell for many southern and central areas, lasting into the afternoon. There were some showers left behind the main band of rain, mainly over high ground in the south of Wales and the southwest. A second band of rain then quickly swept across the country in the late afternoon and evening, slightly dissipating in the south. This also cleared the UK by midnight. Strong winds were recorded across the country, with severe gales along Welsh and northwest Scottish coasts.

Summary of the UK Weather for Wednesday 11 January 2023

Scotland and Northern Ireland saw a wet and windy start to the day, while it started mostly dry elsewhere, with just the occasional light shower across western and northern parts. Through the early hours, rainfall across Northern Ireland and Scotland persisted, becoming heavier in places and more widespread, meanwhile, showers across England and Wales developed, and edged eastwards into central parts. The West of Scotland experienced a band of showers, which were heaviest on higher ground throughout the period. By 09Z, a band of dynamic rain moved in over Ireland, south Wales, and North Devon. This caused significant accumulations over south Wales and southwestern England. The front cleared Wales by early afternoon, but persisted in southern England, progressing eastwards. The northeast of England was also affected by heavy rainfall at this time. A further band of heavy rain moved into Northern Ireland and western areas in the evening. Strong winds affected all areas throughout the period, with severe gales in places. Temperatures were mild in the south, but much chillier in the north.

Daily Weather Summary for Thursday 12 January 2023

This day's summary created 19/01/2023 03:03

Summary of the UK Weather for Thursday 12 January 2023

It was an unsettled start for most under the influence of a low pressure system situated over the UK. A vast band of rain covered southern half of the country at midnight, gradually dissipating through the small hours. Rain became confined to southern England and southern Wales by dawn. It was also a windy start for southern half of the country, with coastal gales reported in the southwest. It continued to be very unsettled into the day, with a complex frontal system over the UK consisting of two cold fronts in the south and a wraparound occlusion in the north. The morning started with a thick band of rain in the southwest, but mostly dry elsewhere, this band of rain moved eastwards, clearing the southwest after lunch, meanwhile another band of rain pushed across northern England and Scotland. There were also some showers in central England throughout the day. The evening was very blustery, with strong coastal gales especially along the Irish sea and in northern Ireland, but also some strong gusts east of the Pennines. Much of the rain in England and Wales had completely cleared by night, however it remained wet in Scotland.

Daily Weather Summary for Friday 13 January 2023

This day's summary created 20/01/2023 03:03

Summary of the UK Weather for Friday 13 January 2023

It was a very windy start to the day with gusts of up to 82mph recorded in the northeast, guided by a low pressure system off the east coast of Scotland. Three looping occlusions covered the UK, bringing cloud and scattered showers for many through the early hours, particularly in central and northern England, and across Scotland - less so in the South. These showers generally began to ease towards dawn, heavily persisting over Wales and parts of Scotland. A mostly dry morning for much of England, with just occasional showers in the southwest first thing and some more persistent rain in the north of England. Despite some showers in Wales around dawn, these eased through the morning. Scotland and Northern Ireland were affected by heavier showers from the west for much of the day. Into the evening an extensive band of heavy rain arrived from the west, affecting southwest England, Wales, Northern Ireland, and southwest Scotland.

Summary of the UK Weather for Saturday 14 January 2023

A band of heavy rain progressed northeastwards across the UK. The rain persisted in western regions throughout the period, only clearing Northern Ireland around 05Z. Winds strengthened with the progression of the front. Temperatures were initially chilly throughout but became milder in southern regions with the progression of the warm sector. Scotland remained chilly. From the early morning, showers and rain were observed in most of the UK. Around late morning, cloud and rain gradually decreased from the north and central England, but the rain continued across south and southwest of England and highlands of Scotland. After lunchtime, showers and rain were more concentrated across the highlands of Scotland, northern England and some parts of central England. While cold, dry and clear conditions were observed over the rest of UK.

Summary of the UK Weather for Sunday 15 January 2023

A low pressure centred off northeast Scotland cast an occlusion southeastwards across the UK overnight. This led to heavy rainfall across the north clearing to occasional showers as the front passed. Scattered heavy showers also affected the southwest and Wales, whilst much of the south and east remained dry. By dawn, the occlusion had reached the north midlands and had started to weaken. This caused any early rain in this area to break up to showers throughout the morning and eventually clear away by midday. An intense occlusion passed over southwest England throughout the morning, bringing with it extremely heavy and thundery showers, hail, and in some areas sleet. This moved southeastwards off the coast by early afternoon, leaving behind scattered showers across Wales and parts of the southwest. The far north of Scotland was also subject to rain and snow throughout the day. For the rest of the country, conditions were mostly dry with sunny spells. Into the evening, a large band of heavy rain spread over the southwest of England, moving eastwards throughout the rest of the night.

Summary of the UK Weather for Monday 16 January 2023

A low pressure system to the south of the UK moved eastwards, sending a spiraling band of heavy rain over the south of the country overnight. Under cold conditions, the rain turned to snow over the North Downs, and to sleet in the surrounding areas. The far north of Scotland, the north of England, north Wales and the far southwest also saw showers, heavy in places, brought in by various occluded fronts in the northerly flow. These showers fell as snow in the north. Dry areas saw variable amounts of cloud, with clear spells at times. Through the morning, cloud continued to clear southeastwards across the UK, leaving largely clear skies for England and Wales by the afternoon. There were occasional sferics within this cloud as it cleared the southeast. Meanwhile, Scotland and Northern Ireland saw more widespread cloud coverage with wintry showers and snow, particularly across northern Scotland. Into the evening, a band of cloud moved over the southwest and southern Wales, bringing rain to parts of Cornwall.

Summary of the UK Weather for Tuesday 17 January 2023

It was a dry start to the day, with clear skies for much of the country. The far southwest saw some unexpected snowfall through the morning, which settled to low levels. Scattered snow showers remained along Scottish coasts for much of the day, bringing widespread travel disruption due to drifting snow and icy conditions. It remained dry for most of the country through the day, although Scotland was placed under an Amber warning for snow due to continued snowfall. Northern Ireland was under cloud cover for much of the afternoon, bringing some snow and sleet showers across the region. Into the evening, cloud, accompanied by showers, pushed southwards from Scotland, extending as far as the Midlands and bringing some mixed-phase showers and snow to north Wales and the northwest of England. Approaching midnight, skies were clear across the south and southeast, but showers continued across northern parts and for higher ground in Wales and the southwest.

This day's summary created 25/01/2023 03:03

Summary of the UK Weather for Wednesday 18 January 2023

From midnight, cloud and wintry showers were present across the highlands of Scotland and some parts of central and southwest England. Showers and rain gradually decreased from central England, but continued in the southwest and in Scotland. Elsewhere, it was largely cold, clear and dry through the early hours. A low pressure system lay off the northeast coast, and progressed south through the day before pushing east into the evening. Wintry showers persisted across Northern Ireland, northern Scotland, Wales and over the southwest through the morning, generally moving southeastwards. Snow accumulations up to 37cm were recorded in the Scottish Highlands throughout the course of the day. The southeast remained clear for much of the day and into the evening, allowing widespread frost.

Summary of the UK Weather for Thursday 19 January 2023

It was a dry start to the day for most of the country, with patchy cloud covering western areas from midnight, but gradually moving eastwards through the early hours. By 0200, showers were passing southeastwards through the Cheshire Gap, bringing snow to north Wales and parts of the northwest. Northern Scotland and Northern Ireland saw continuing wintry showers through the morning, bringing snow and sleet to low levels. Frost was widespread with freezing fog present under clear skies. An occlusion progressed south across the northern UK, bringing wintry showers of sleet and snow with strong winds. These were gale force in places, causing drifting snow. The front dissipated as it moved into northern England causing more isolated showers here. The rest of the country was chilly with mostly clear skies. In the evening, the northerly air flow brought more showers of snow to northeast Scotland, again accompanied by strong winds. The winds were light in southern areas ahead of the front and remained light throughout in the south.

Summary of the UK Weather for Friday 20 January 2023

It was a dry and largely clear start for most of the UK. Rain and sleet were seen only across the tip of Cornwall and eastern parts of Scotland during the early hours. Frost and icy stretches were widespread this morning after a rather cold night. A ridge of high pressure sat over the UK for the rest of the day, resulting in a clear and dry day for many. However a weak occlusion did bring some rain and showers stretching along the east coast. There was also some light localised showers in Cornwall during the morning, which had all cleared by lunchtime.

Daily Weather Summary for Saturday 21 January 2023

This day's summary created 28/01/2023 03:03

Summary of the UK Weather for Saturday 21 January 2023

At midnight, it was clear for most in mainland UK, leading to a dry, frosty morning for all. An occlusion spanned the length of the country, covering Northern Ireland in a band of cloud, bringing slightly milder temperatures but remaining cold. This occlusion progressed eastwards through the early hours, initially covering western Scotland with a band of rain, heavy at times. Elsewhere remained clear, with fog predominantly in central and southwestern areas. The minimum recorded temperature was -10.2 degrees Celsius at Braemar No. 2, Aberdeenshire. A frontal system spanning the length of the UK progressed slowly eastwards through the day, bringing some organised cloud and rain. This band of rain continued to move across Scotland before tapering off at around 1300, although some patchy showers remained. The rest of the day remained largely dry and clear, but with stubborn fog patches affecting much of the Midlands, Yorkshire and Wales. Into the evening, showers associated with this frontal system returned to Northern Ireland, western Scotland and the Scottish Highlands. Elsewhere it was a clear evening, with some fog reforming. The maximum recorded temperature was 10.1 degrees Celsius at St Mary's Airport, Isles of Scilly.

This day's summary created 30/01/2023 03:03

Summary of the UK Weather for Monday 23 January 2023

Most of the country was dominated by an area of high pressure to the east producing clear conditions, with some scattered cloud. Frontal rain moved west and northwards across the north of Scotland gradually dissipating over the course of the night. Most other places remained dry. By early morning the clear skies had produced a widespread frost across much of south and central England, accompanied by freezing fog patches in places. There was a large temperature contrast across the country as the north experienced unseasonably mild conditions, but it was very cold further south. After dawn much of the country remained dry apart from very isolated showers in the north of England and the northwest of Scotland, the latter of which developed into more prolonged relief rain in the late afternoon. The brightest and clearest conditions stretched across England from the southwest to the East Midlands, while the surrounding areas experienced more overcast skies. The temperature contrast remained noticeable throughout the day and while all areas reached above freezing, northern areas remained the mildest.

Summary of the UK Weather for Tuesday 24 January 2023

High pressure continued to dominate across the UK this morning. Some parts of the north of Scotland did see spots of light rain, however it was generally a dry night for most with patchy cloud spread across most areas. A corridor of clear skies with a widespread frost stretched across the country from the southwest and Wales to the East Midlands. This also produced some patches of freezing fog, predominantly in the east of Wales and for parts of central and southern England. Conditions remained similar throughout the day, with cloud remaining in place across Scotland, the north of England, Northern Ireland, and areas of the southeast. It remained dry for much of the country, although some light showers continued in southern Scotland. Under this band of clear skies, fog remained in place for much of the day, causing some travel disruption. Into the evening, some showers arrived along western hills as a frontal system approached from the northwest. The corridor of clear skies narrowed as the evening progressed, with fog reforming in places.

Summary of the UK Weather for Wednesday 25 January 2023

Under the influence of high pressure, the UK saw a mostly clear and cold start, with just some scattered showers across the Scottish Highlands as a cold front moved in from the northwest. Southern and central regions saw another foggy start, with reports of mist, haze, and freezing fog in places, particularly in the southeast. The morning saw the cold front, accompanied by an occlusion, slowly sweep across the UK, southeastwards, bringing a band of patchy rain and cloud. Northern Ireland, parts of north Wales, and northeast England saw patchy light rain also. The rainband reached central areas by midday, meanwhile fog persisted in the south and southeast. Through the afternoon and into the evening, the cold front cleared to the southeast, bringing some rain and drizzle across southern parts, and the East of England region, while foggy conditions continued in these areas also. The Scottish Highlands and Northern Ireland continued to see patchy light rain throughout the afternoon and into the evening. Elsewhere saw mostly clear and dry conditions into evening.

Summary of the UK Weather for Thursday 26 January 2023

Higher pressure remained in charge for the UK through Thursday. Northern Ireland, northern and eastern Scotland, and northeast England saw some patchy light rain. Otherwise, it was a mostly benign start to the day, with largely dry conditions and clear spells through the early hours. It was a dry day for most of the UK with a few light showers making it inland from the east coast along the length of the country, some making it to the Pennines before decaying completely. Patchy low cloud hung around for many through the day, but some places experienced sunny intervals, especially in the west. Here some frost and fog developed in the evening and into the night, although temperatures generally stayed above freezing.

Summary of the UK Weather for Friday 27 January 2023

It was a dry start to the day for most of the country, with scattered showers affecting parts of Northern England. Patchy cloud cover remained in place throughout the early hours, although some more organised cloud had moved over northern Scotland by 0300 as a warm front approached from the northwest. These showers gradually extended southwards, reaching southern Wales and parts of central southern England, before decaying almost entirely at around 0430. Overnight frost formed in places across the 4 home nations. It was a dry day for most with sunshine and showers in many places and only a few scattered showers across Wales and southwest England. By 1800, a cold front hit the northwest coast of Scotland bringing a band of rain which continued southeastwards across Scotland throughout the evening. The rest of the country was dry.

Summary of the UK Weather for Saturday 28 January 2023

A dissipating cold front progressed southeastwards from the Western Isles across Scotland through the night. This resulted in a few showers in the northwest of Scotland progressing with the front and becoming more scattered in nature. The rest of the country saw cloud and scattered intervals of clear skies. The wind was generally light, slightly stronger in the northwest. Temperatures were generally in low single figures, colder under clear skies. Through the remainder of the day, most of the UK was covered by a blanket of low-lying cloud, with localised outbreaks of drizzle across Scotland and northern England during the morning, generally pushing southeast. There were some sunny intervals across Scotland throughout the day, where temperatures were generally milder than in the south.

Daily Weather Summary for Monday 30 January 2023

This day's summary created 06/02/2023 03:03

Summary of the UK Weather for Monday 30 January 2023

At midnight, showers, locally heavy, dominated across most of Scotland and these continued throughout the early hours. By 0600, only a few scattered showers remained. The rest of the country had a dry morning. Cloud covered much of southern England early on, but further north it was clear. Strong westerly winds were felt in the north. Patchy cloud remained in place across the west throughout the day, edging gradually eastwards but generally clearing before reaching eastern coasts. Scattered showers were present across parts of Scotland for much of the day, occasionally extending to the northwest of England. At around 1500 a more organised band of rain associated with a warm front approached the Western Isles, continuing to progress to the east into the evening. This was followed by another dense band of rain, locally heavy, which tracked southeastwards across Scotland towards midnight. Central and southern areas remained dry and largely cloud-free, although some medium level cloud started to develop at 2200.

Summary of the UK Weather for Tuesday 31 January 2023

During the early hours of the morning, a cold front located across Scotland led to showers, locally heavy, throughout. By 0400, rain dominated in northern Scotland, spreading eastwards with showers following behind. Most of England remained dry throughout the early morning, although the cold front resulted in a large band of cloud across the country. The cold front led to showers in northern England, which moved southwards into parts of the midlands by 0300. Most of the rain had dissipated across England by 0600. The cold front continued to move south and decay through the day, followed by a second cold front. These were both relatively weak features and resulted in a band of patchy light rain moving southwards, clearing to the south by lunchtime. Showers increased in frequency and intensity in Scotland through the day, and moved southwards reaching northern England by mid-afternoon. It was cloudy in Scotland and northern England, whilst the rest of the UK experienced patchy cloud interspersed with bright clear spells, especially in the south after the fronts had passed.

Daily Weather Summary for Tuesday 31 January 2023

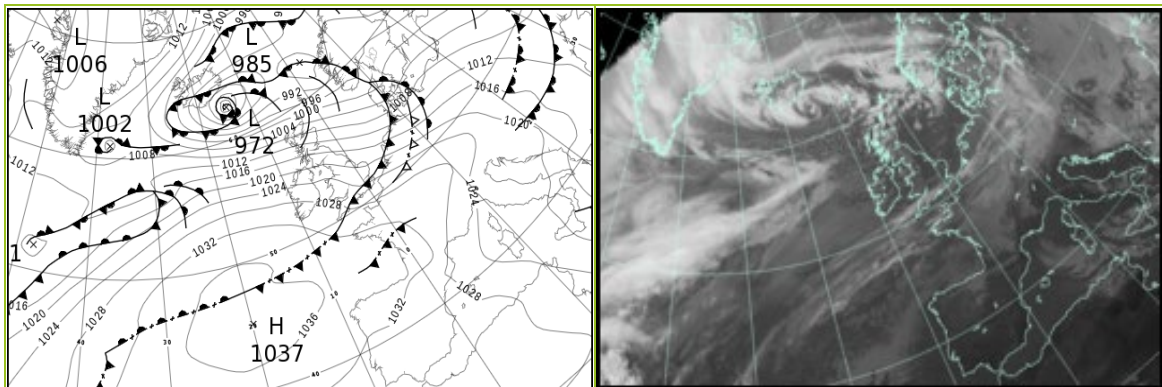

Daily Weather Summary for Tuesday 31 January 2023

Guidance Notes

UTC = Universal Coordinated Time. For the UK UTC is the same as GMT (Greenwich Mean Time).

National boundaries shown on the European station map are for illustrative purposes only.

Daily extremes

- Daily extremes have been manually confirmed by Met Office Observations Quality Management as valid observations from the live database at the time of checking. However, more extreme values may still be possible if they occur after the time of production.
- Mountain stations above 500 masl are excluded from lowest temperatures, highest gust speeds and greatest snow depths at 0900 UTC. This is because they are not considered representative of low level areas.
- Counties quoted against each station are based on historical county boundaries pre-1974 and may not reflect current administrative boundaries.

Analysis charts and satellite imagery

- The satellite imagery is infra-red imagery from the geostationary MSG satellite.
- The rainfall image is derived from satellite data from MSG and rain-radar data. This represents a snapshot of instantaneous rain-rates at 0000 UTC and 1200 UTC and so does not necessarily reflect daily accumulations in the rainfall station map.
- Any analysis charts or satellite images which are unavailable will be displayed as white space.

Station maps

- The UK maps show station data for the same set of stations presented UK data table. These stations are selected to provide good spatial coverage across the UK; they represent only a fraction of the overall UK observing network.
- Wind speed maps show wind speed in Kt and direction both averaged over the hour up to the time of observation. 1 Kt = 1.151 mph.

Hourly station data

- The data tables provide spot hourly observations from synoptic messages at 0000 and 1200 UTC. Missing data are denoted by '-'.

- Pressures are mean sea level pressure in hPa.
- For UK stations, Gibraltar and Jersey, the wind speeds and directions are both averaged over the hour up to the time of observation. However, for European stations wind speeds and directions are both averaged over a 10-minute period up to the time of observation.
- Wind speeds are in Kt. Wind directions are stored in the database every 10 degrees and have been converted to the nearest point of the compass. These give the direction the wind is blowing from, not to.
- Cloud amounts are in Oktas from 0 (clear) to 8 (overcast). 9 indicates sky obscured (eg by fog).
- Air temperature and dew point temperature are in Celsius.

Temperature maps

- Daily maximum, minimum and grass minimum temperatures are in Celsius.
- The period for the daily maximum temperature is defined from 0900 UTC on the day in question to 0900 UTC the following day.
- The period for the daily minimum and grass minimum temperatures is defined as 0900 UTC the previous day to 0900 UTC on the day in question.
- On any given day the minimum will typically occur in the early hours of the morning and the maximum in early afternoon.

Rainfall, sunshine and max gust speed maps

- Daily rainfall is in mm from 0900 UTC on the day in question to 0900 UTC the following day.
- Daily sunshine is in hours from Kipp and Zonen CSD1 automatic sunshine records. Bright sunshine is defined as exceeding 120 W/m².
- Max gust speeds are the daily max gust in Kt from 0000-0000 UTC

Snow maps

- The day of snow falling map displays data from present weather sensors, showing stations which have recorded sleet or snow falling at any point in the day (0000-0000 UTC).
- The snow lying map shows level snow depth as recorded by the automatic snow depth sensors at 0900 UTC. These snow depth sensors do not record snow depth if this is less than 1cm.
- Snow depth sensors are normally operational from October to April, in the event of snow falling outside this period data availability may be limited.

- Snow maps will only be displayed if one or more of the selected stations on that date have recorded either snow falling or non-zero snow depths. If snow maps are not displayed it is still possible that other stations in the network have recorded a day of sleet or snow falling or non-zero snow depth.
