Daily Weather Summaries for May 2022

If you have any questions or feedback about this product or wish to obtain further data please contact the Met Office.

This document contains daily weather summaries for each day of May 2022. The Met Office National Meteorological Library and Archive holds a continuous record of daily weather summaries or daily weather reports from 1860, and these daily weather summaries form a continuation of that series.

The purpose of each summary is to provide an overview of the weather conditions across the UK on that day, with the historical emphasis mainly based on observations from surface network of weather stations, although the format has varied over the decades. While the emphasis remains on observations from the surface network, the current daily weather summaries supplement these by including satellite and rain-radar imagery to provide a more complete overview. The current format of the daily weather summaries is as follows:

1. Text summary of the main characteristics of the weather during the day, written by an operational meteorologist in the Met Office operations centre.
2. Table of daily extremes for the UK for key climate variables including temperature, rainfall, sunshine and gust speeds.
3. Overview of the synoptic situation at 00 and 12 UTC comprising: analysis charts showing the surface pressure pattern and associated weather fronts; North Atlantic and European infra-red satellite images showing cloud-cover; combined infra-red and rain-radar images of the UK; maps of wind speed and direction at 00 and 12 UTC; observations of pressure, wind speed and direction, cloud cover, air and dewpoint temperature at selected UK and European stations in data tables.
4. UK maps of key climate variables from observing stations including maximum, minimum and grass minimum temperature, rainfall, sunshine, gust speed and snow.
5. Further guidance notes

If you spot any data errors or omissions in this product please contact the Met Office.

Daily Weather Summary for Sunday 01 May 2022

This day's summary created 08/05/2022 03:03

Summary of the UK Weather for Sunday 01 May 2022

Frontal rainfall, associated with a low-pressure system, continued to push southeastwards across the UK. This cleared from Scotland and reached the southwest of England by dawn. Mist was observed in northeast Scotland but cleared during the morning. Rain continued to move southeastwards, affecting the southwest by mid-morning, becoming patchy over Northern Ireland and locally heavy in Wales. Into the afternoon, the persistent rain cleared over Northern Ireland and Wales, leaving just some scattered showers. It was cloudy for all areas throughout the period, apart from in northwestern Scotland, where there were some sunny breaks. Some extensive low cloud and hill fog reduced visibility in many regions. Into the afternoon the rain eased in the south, becoming patchy by early evening. The rain continued to be patchy for most, except for in Scotland, into the evening. It was slightly breezy throughout the day around the low pressure, but this eased as the front passed.

Summary of the UK Weather for Monday 02 May 2022

It was a cloudy start to the morning for most, except for the far east and parts of Scotland, where cloud was more broken. Patches of rain were seen across the far south of England, northern parts of Scotland, and Northern Ireland during the early hours. Early mist and fog patches were seen across parts of Wales, Yorkshire, central and southern England. These cleared through the morning, although parts of the West Midlands and Yorkshire stayed hazy for a little longer. Through the rest of the morning, most areas remained dry but rather cloudy, so sunshine was limited. Some showers slowly developed over the east of Scotland, Northeast England and towards the southwest of the UK. In the afternoon and into the evening, scattered showers broke out elsewhere across the country, although the southeast and parts of southern England remained mostly dry throughout the day. It stayed generally cloudy for most into the evening, with a few showers persisting.

Summary of the UK Weather for Tuesday 03 May 2022

The day started with patchy cloud and showers across Scotland, northern England, and the Midlands, which travelled southeastwards through the early hours. Early mist and hazy conditions were seen across the south, and fog was reported in Aberporth, Wales, and in Somerset. Further showers reached Wales by dawn. Visibility continued to be poor in places after dawn, with sea fog and mist observed in the west and far southeast, as well as hill fog in many parts of the UK. Some of this prevailed through the day. Most places continued to be overcast throughout the day, as an occluded front brought some showery rain over central regions. Parts of the southwest and Wales saw sunny spells in the morning, leading to convective clouds developing (and peninsular convergence), producing heavier showers over these areas in the afternoon. A heavy band of rain reached Northern Ireland in the early afternoon and made its way north and west throughout the rest of the day. A frontal system brought heavy precipitation to western Scotland and northwest England during the evening.

Summary of the UK Weather for Wednesday 04 May 2022

A complex frontal system arriving over the UK brought heavy precipitation to northwest England and western Scotland. This band of rain continued to spread westwards through the early morning, affecting further parts of Scotland and northern England. It was a cloudy start for most, with southwest England and southern Wales being the only regions with any clear spells. Winds remained generally light, with some breeze in northern Scotland and northwest England. Fog patches and mist were observed in parts of southwest England and western Scotland overnight. Several frontal systems, including eastward-moving occlusions, continued to progress across the UK through the rest of the day, causing variable amounts of rain to move along with them in often very fragmented bands. While some areas saw generally overcast conditions, bright and sunny spells were also seen in parts of the west. Additionally, there was a trough which produced some showers over central England, Wales and Scotland during the morning. Into the afternoon, the trough intensified and caused thunderstorms to develop, along with lightning and some heavy showers across eastern England and Scotland. By midnight, a band of rain approached the Western Isles of Scotland.

Summary of the UK Weather for Thursday 05 May 2022

A warm front approaching the UK from the west brought a band of rain which progressed southeastwards in the early morning hours, affecting Northern Ireland, parts of northern Scotland and northwest England. Any clear spells occurred in the south of the country, while the north saw mostly overcast conditions. Winds were generally light to moderate for most. Throughout the day, the warm front continued to move southeastwards, behind which showers developed in the northwest of the UK. The south and east of the UK were largely dry, with high cloud and hazy sunshine. It was widely warm but cooler around the coasts and closer to average under cloud in the north-west. Into the evening a band of rain approached western Scotland, but the clear skies remained for most of England and Wales.

Summary of the UK Weather for Friday 06 May 2022

A cold front approaching from the northwest brought persistent rain to northwest Scotland, which spread southeast into Northern Ireland and central Scotland through the morning. This was accompanied by moderate winds in the Western Isles. Whilst it remained dry for the rest of the UK, cloud also spread southeast through central England and Wales, with only East Anglia and the south coast keeping a clear sky through to dawn. Winds were generally light. Early mist and hazy conditions were seen across the east coast, the southeast, and north Wales. By late morning, the band of rain had approached the north of England. With the passing of the cold front, came increased cloud cover across the north and central England, and the southwest. Later into the afternoon, the precipitation continued over the northern and central regions, including Manchester and Lincolnshire, becoming patchier over the southwest later into the evening. The cloud became more widespread throughout the day, reaching the far southeast by early evening. Into the evening the frontal rain continued to move southeastwards, reaching East Anglia and London by midnight.

Summary of the UK Weather for Saturday 07 May 2022

A band of rain continued to move southeastwards from London through the morning, clearing the Kent coast by 03Z. There was also some patchy rain in central and western Scotland, and East Anglia until dawn. It was a cloudy start to the day for most, with only central and northern England having some clear spells. Winds were light throughout. Scattered showers continued through central parts of Scotland and southern East Anglia for most of the day, the latter being caused by an occluded front making its way southeastwards. These showers almost completely dispersed later in the afternoon but these areas also experienced most of the cloud cover. Generally cloud cover increased over the course of the day, particularly over central England and Northern Ireland. Settled conditions with light winds prevailed for most throughout the day, with the southwest and Wales seeing most of the clearer skies and some sunny weather. Into the evening, the showers continued to fade, leaving clear spells for many.

Summary of the UK Weather for Sunday 08 May 2022

The night's weather was dominated by high pressure, centred over the northwest of the UK. Winds were light, allowing for low cloud bases in the Thames estuary to extend westwards to Berkshire. Some fog patches also formed in the northwest and southwest into the morning. It was dry for most, with the exception of some thicker cloud and patchy rain that moved into western Scotland in the early hours. Temperatures were mild for much of the UK but colder in northeast England and northern Scotland, falling below freezing in places. A band of rain continued to move northeastwards over parts of northern Scotland in the early morning hours. Elsewhere, it was a fine and dry day with mostly light, southeasterly winds.

Summary of the UK Weather for Monday 09 May 2022

While high pressure sat to the east of the UK, a low-pressure centre approached from the northwest through the early hours. This brought wet weather for parts of northwestern Scotland and northwestern Ireland. A series of fronts brought heavy rain across Ireland and northwestern Scotland, which persisted throughout the morning. It remained dry elsewhere, with variable cloud throughout and slight fog in The Trossachs, Highlands, Cumbria and parts of northwest Wales, all of which eased by dawn. The rain persisted across Scotland and Northern Ireland in the northwest during the morning, becoming patchier and reaching the north of England and parts of north Wales by midday. Continuing to become patchier over the afternoon, the rain moved southwestwards, reaching south Wales and parts of central England into the afternoon. Meanwhile the south remained dry and bright, becoming cloudier into the afternoon as the fronts moved over the UK.

Summary of the UK Weather for Tuesday 10 May 2022

High pressure continued to dominate, with a low vortex sat to the west of the UK. Through the night a series of fronts moved ESE across the country with an area of rain moving eastwards over western England and northwestern Scotland. Although heavy at times, this dissipated through the night, leaving patchy cloud across much of the country. This was followed by a second band of scattered showers across western Scotland in the early hours, which were heavy at times. The far south was largely unaffected by any rain until the early morning, when a block of showers travelling eastwards hit parts of the southwest and Wales. The southwest reported early mist, and the showers passed by late morning. The southeast, central, and northern England began to see patchy rain and drizzle into the morning but cleared into the afternoon. While scattered showers persisted through the day across Scotland and Northern Ireland, Scotland saw heavier rain and Northern Ireland reported lightning through the afternoon. The showers in Scotland continued into the evening and overnight, while everywhere else remained dry.

Summary of the UK Weather for Wednesday 11 May 2022

An occlusion brought bands of scattered showers, heavy at times, across the west of Scotland through the early morning. These slowly dissipated, leaving patchy cloud over most of Scotland, Northern Ireland and northern England. The southern part of the country saw a much drier start to the day, with stratiform cloud sitting over much of this part of the country. However, a low pressure system southwest of the UK brought a large area of rain northeastwards through the morning, reaching much of Wales and central England by dawn. The large rainfall band continued to move east across southern and central England, finally clearing East Anglia and the southeast by early evening. Although avoiding this frontal rain, Scotland and Northern Ireland experienced scattered showers, heavy and thundery at times, through most of the day. It was dry and clear for much of the southwest and Wales for the afternoon and into the night. Moderate winds experienced for most throughout today, dropping into the evening as the showers diminished and fronts moved away.

Summary of the UK Weather for Thursday 12 May 2022

A decaying occlusion brought bands of scattered showers, heavy at times, across most of Scotland and Northern Ireland through the start of the morning. The southwest also experienced some lighter showers, elsewhere remained dry. Southern UK experienced clear skies throughout, with cloud building over Scotland, Northern Ireland, northern England and parts of Wales and Cornwall. Winds were light and temperatures were mild overnight. A warm front approached the far northwest after dawn, moving eastwards through the morning. It brought cloud, showery rain and gusts of 30 knots into northwest Scotland, which were heaviest over the Northwest Highlands around lunchtime. Elsewhere the weather was rather benign, although breezy with fair weather clouds, and a few light showers in the far southwest. This theme continued into the afternoon, with rain and gusts reaching Welsh higher ground, and heavier rain spread into Northern Ireland. Meanwhile, southeast England saw sunny spells, and generally less cloud throughout the day.

Summary of the UK Weather for Friday 13 May 2022

A low pressure system approached the UK overnight, travelling eastwards. Scotland and the north of England saw a band of rain through the early hours, while Northern Ireland and the southwest saw scattered showers. The rain weakened through the morning, while the rest of the UK saw a benign start to the day. Scattered precipitation continued to affect parts of Scotland and northern England through the day, weakening towards the evening. Fine and dry weather prevailed elsewhere. The best of any bright spells were seen in central and southeast England, while northern Wales, northeast England and Northern Ireland remained under thick cloud for most of the day. Generally moderate winds, however locally breezy. In the evening, any rain in the north of the country mostly died out, leaving clear spells with easing winds for most. Isolated fog patches were observed in the far south.

Summary of the UK Weather for Saturday 14 May 2022

The day started with patchy rain over Scotland and Northern Ireland, and variable amounts of cloud over the north and the southwest. Many southern and eastern areas saw a largely clear start to the morning, but some were affected by mist and haze by daybreak, particularly on the coast. Fog was reported in Oxford, Brize Norton, and North Yorkshire at dawn. It was a dry day for most, other than the odd isolated shower seen in the morning in northern England. There was patchy cloud across the country, with England, Wales and Northern Ireland getting the best of any sunny spells later in the morning and in the afternoon. Scotland experienced high cloud for most of the day. Into the evening, some locally heavy showers approached from the south, reaching southwest England by midnight. The wind was light and variable for most throughout the day.

This day's summary created 22/05/2022 03:04

Summary of the UK Weather for Sunday 15 May 2022

A trough arriving over the UK from the west brought locally heavy showers to southwest England at first. These continued to move northeastwards through the early morning, affecting parts of Wales, Northern Ireland and England. The best of any dry weather and clear spells was seen in Scotland. Good visibility prevailed through the early morning for most. These initial showers continued to clear northwards but were followed by several troughs that brought more bands of showers in from the south. The troughs influenced England and eastern Wales throughout the day, bringing the heaviest rain to Dorset in the mid-morning. Scotland and Northern Ireland had a mostly dry day, with showers restricted mainly to the west. Whilst most of the UK saw a dry evening, two more heavy and thundery showers moved northwards from the Channel, one reaching the Isle of Wight and Hampshire around dusk and the other arriving at the Dorset coast just before midnight. Light winds were experienced by most through the day. Some breeze developed into the evening at the west coast of Scotland and in northwest England.

Summary of the UK Weather for Monday 16 May 2022

A band of convective clouds bearing showers and thunder moved northwards over the UK through the early morning. At first, southern coastal areas such as Dorset saw some thunderstorms. By dawn, it arrived over northern England, Northern Ireland and parts of Scotland, bringing locally heavy rain to these regions. Thick cloud cover resulted in poor visibility for many, with multiple locations across central and northern England reporting mist or fog in the early morning. Throughout the day and into the evening, cloud and rain continued to move northwards through Scotland. This was followed by a series of occluded fronts and troughs, bringing unsettled weather to most of the UK. Lightning was reported in many parts of the UK, including Northern Ireland, north Wales, and the northern half of England. Some brighter spells were seen at times in Wales and the southeast of England.

This day's summary created 24/05/2022 03:03

Summary of the UK Weather for Tuesday 17 May 2022

A small band of rain over northeast England and southwest Scotland moved northeastwards in the early hours. Northern Ireland also had some very slight amounts of rain. Most other areas stayed dry but with variable amounts of cloud; some mist and fog was reported in Scotland and northern England. The wind was light and variable for most. A heavier area of rain associated with a developing frontal wave pushed into southwest England and Northern Ireland into midday. This continued northeastwards throughout the afternoon, bringing with it cloudier conditions for much of western UK. Winds were light and generally southeasterly, allowing for above average temperatures, and well above average temperatures in the southeast where it was sunniest. Isolated thunderstorms moved into the south and southeast through the evening.

This day's summary created 25/05/2022 03:03

Summary of the UK Weather for Wednesday 18 May 2022

The day started with heavy showers for Northern Ireland and some lighter rain over Scotland and eastern England. The heavier showers persisted as they moved northeast into central Scotland. The rest of the UK remained dry. It was a cloudy morning for Scotland and Northern Ireland but clear for much of England and Wales, with some isolated mist and fog reported for a time in southern England. The southerly winds were light to moderate throughout. By mid-morning, the rain cleared from Northern Ireland, while patchy rain persisted across western Scotland, ceasing by midday. Cloud cover became widespread across the UK from noon, while a scattered patch of showers moved in over the southwest and travelled northwards, along with another band of rain over Northern Ireland, becoming heavier through the afternoon. The two bands of precipitation continued traveling towards the north of England, strengthening into the evening, bringing thundery showers along with lightning to Northern Ireland. Intense showers also travelled northeastwards from the continent, over to the southeast into the evening.

This day's summary created 26/05/2022 03:03

Summary of the UK Weather for Thursday 19 May 2022

A band of frontal rain cleared from Northern Ireland and moved over Scotland and northeastern England through the early hours, clearing most places by 04:00. There were also showers for southern and eastern England, some of which were thundery with intense lightning, and around dawn further showers moved up from the south. Winds were generally light but variable in direction under the storms. Mist and fog formed in the clearer skies following the storms in southern and eastern England, but lifted to the east by mid-morning. The intense band of rain cleared from the southeast by the late morning, leaving most of the UK dry for the rest of the day, other than a smattering of showers over central England, the Hebrides and Northern Ireland. Most of the country saw sunny spells for the rest of the day, most of which were across central England. Winds were light. Dry conditions continued into the evening, except in the northwest of Scotland, which experienced more changeable conditions, with stronger winds and showers at times.

Summary of the UK Weather for Friday 20 May 2022

Medium level cloud spreading up from the southwest brought some patchy light rain into the UK through the early hours. In the northwest, an occlusion moving eastward brought showery and breezy conditions overnight. It was cloudy for many but in clearer areas in Scotland and northeastern England it became quite chilly. By dawn, an occlusion travelled eastwards across the north, which brought a band of patchy rain across west Scotland and Northern Ireland. During the same time frame, a warm front travelled northwestwards from the continent and brought a thick band of rain, locally heavy for a time. The rain reached central and the north of England by midday and began clearing into the afternoon, but most places remained cloudy. Later into the afternoon, the occlusion reached the south coast, and brought scattered showers to parts of the southwest. This continued to move eastwards into the evening, resulting in heavy showers across Scotland.

Summary of the UK Weather for Saturday 21 May 2022

Several occluded fronts made their way across the country during the early hours. A band of rain cleared the northeastern tip of Scotland in the first few hours after midnight, and western parts of Scotland and the north of England also saw scattered showers, heavy at times, throughout the night. It was a dry night otherwise; patchy cloud lingered over much of the country, with the clearest spells in the central and southern parts of England. Towards dawn, Northern Ireland started to see some showers. It remained benign throughout the day. Scattered showers continued across western Scotland through the morning, and reached Northern Ireland, north Wales, and parts of central England by lunchtime. Into the afternoon, the showers mainly ceased, leaving just some patchier rain across central and western Scotland, and Northern Ireland, which were locally heavy, but it remained largely dry elsewhere. There was patchy cloud across much of the UK throughout the day. The rain continued into the evening; it became patchy as it travelled eastwards.

Summary of the UK Weather for Sunday 22 May 2022

A few occluded fronts brought bands of rain, heavy in places, to the north and west of Scotland. Parts of Northern Ireland, Wales and the north of England were the only other areas to see some showers. It was a dry, albeit cloudy start to the day with clear spells for the south and east. Early mist was reported along the south of England. It was breezy in the northwest and down western coasts. Elsewhere, winds were light, although variable in direction throughout the night. Throughout the day there was a clear northeast-southwest split, with sunny spells for the south and southeast, and showers for northern areas. The showers were light in late morning but became heavier again into the afternoon. Thick cloud encroached through the day in the south, but it remained dry, except a few localised showers in south Wales. Into the evening conditions remained similar throughout the UK, with showers for northern Scotland, and parts of north and central England, but mainly dry in the south.

This day's summary created 30/05/2022 03:03

Summary of the UK Weather for Monday 23 May 2022

There was a low pressure system to the northwest of the UK, this brought cloudy and drizzly conditions for most. This morning began with scattered showers in the northwest Scotland and the Western Isles, Northern Ireland, and parts of northwest England, Yorkshire, and the south. The rain was heaviest over northwest Scotland and southeast England by dawn. The showers continued to move northeastwards, affecting northeast Scotland, northern England, parts of Wales and the southwest. A band of locally heavy rain arrived over the southeast and eastern England in the morning and intensified around midday, to eventually start dissipating in the late afternoon. Showery weather continued to spread into the afternoon, moving across southern and northeast England, the Midlands and the Scottish Highlands. It was a cloudy day for most of the UK, with the best of any bright spells seen in central England before midday and in parts of the south in the late afternoon. Locally heavy showers developed in the south in the evening affecting mostly southeastern regions towards midnight.

This day's summary created 31/05/2022 03:03

Summary of the UK Weather for Tuesday 24 May 2022

This morning began with a uniform band of rain stretching from the southeast to Humberside, and scattered showers over the southwest, Northern Ireland, and parts of Scotland. This dissipated throughout the morning and continued travelling eastwards, leaving patchy rain across the east and southeast lasting until dawn. The scattered showers persisted through the morning across Scotland and Northern Ireland, while the skies cleared in the southwest. Most areas of the UK experienced showers later in the morning. These showers moved eastwards, with some becoming heavy and thundery, especially in southern and eastern England. There were also some sunny spells for most, the best of which were in the southwest. It was a drier afternoon for Wales, Northern Ireland, southwest and northwest England, but the showers persisted in Scotland and for most of England. Most showers cleared eastwards into the evening, but a more organised band of rain arrived from the west, reaching Northern Ireland and the Western Isles by midnight. Generally easterly to northeasterly winds of light to moderate strength.

Summary of the UK Weather for Wednesday 25 May 2022

An occluded frontal system approached northwestern parts around midnight, bringing rain to Northern Ireland, western Scotland and parts of northwest England. Another band of rain progressed slowly from the west/southwest through the small hours, affecting Wales, southwest England and the west Midlands. Elsewhere remained dry overnight, in particular the east, with clear spells over central England. Winds were mostly light southwesterly to westerly to start with but became progressively stronger through the early morning. The bands of rain continued moving eastwards over the course of the day, becoming more scattered as they made landfall. The heaviest showers were in Scotland and at times in Northern Ireland, whereas the south did not see as much precipitation. The easternmost part of Scotland also saw some lightning around midday. Patchy cloud covered much of the country throughout the day, with the clearest spells occurring mid-afternoon in the northeast of England. Moderate breezes were experienced throughout the country during the day, with the west coast seeing the strongest of these.

Summary of the UK Weather for Thursday 26 May 2022

A band of rain associated with a warm front brought precipitation to Northern Ireland, northwest Wales and parts of northern England in the early morning. Some scattered showers were also seen over western Scotland and the Western Isles. Elsewhere, it was a dry and fine morning. The southeast experienced the best of any clear spells, while the rest of the country saw thick cloud spreading southeastwards through the morning. The frontal rain weakened through the morning, and it became cloudier in the warm sector. In the early afternoon, troughs brought convective activity eastwards over Scotland. Most central and southern areas remained dry with light winds.

Summary of the UK Weather for Friday 27 May 2022

This morning began dry for most across the UK excluding some patches of drizzle across Northern Ireland and the south of England. Scotland saw scattered showers in the early hours, mostly in the northwest, locally heavy at times. Early fog was reported in Bristol, which then turned to mist. Most of the UK had a cloudy morning, with any clear spells restricted to the south. The winds were light in the south but stronger in Scotland and Northern Ireland. Showers across northwest Scotland travelled eastwards throughout the day. The weather was benign elsewhere into the afternoon, remaining bright and dry with little cloud cover. The showers across Scotland continued to travel eastwards, weakening through the evening.

Summary of the UK Weather for Saturday 28 May 2022

Most of the UK had a dry start to the day, with just a few showers in central and northeast Scotland. These showers became more persistent over Aberdeenshire around dawn. It was a clear morning for the rest of the UK, with only some patchy cloud reported in Northern Ireland and north Wales. Winds were generally light and northerly. Clear and calm conditions lead to a cool night in places with reports of a touch of grass frost in higher land and sheltered locations. There were also some very localised reports of fog in parts of Wales. A high pressure system stayed to the northwest of the UK, bringing patchy cloud to much of central and eastern parts of the UK for the rest of the day. Most areas remained dry, with parts of the east coast and East Anglia seeing the odd shower in the afternoon. The southwest saw the best of the sunshine. Winds were light, but breezier in the north and east, where it was generally cooler than previous days.

Summary of the UK Weather for Sunday 29 May 2022

The morning's weather was characterised by a ridge extending across the UK. Whilst most areas remained dry, showers started to feed into northern Scotland, eastern coasts of Scotland and England, and some parts of western England through the early hours. It was a chilly start for most, and light winds allowed for formation of mist and fog patches in southwest England. The blocking pattern to the north of the UK continued throughout the day, feeding some scattered showers down the length of the country, particularly through northern Scotland and the east coast of England. Convective cloud bubbled up around midday over Wales and the southwest, leading to heavy showers, thunderstorms and lightning over these areas in the afternoon. Winds remained light and it was generally cooler than previous days. Showers slowly began to die out over the course of the evening, leading to a dry night for most, except in parts of the north and east, where some showers remained.

This day's summary created 06/06/2022 03:03

Summary of the UK Weather for Monday 30 May 2022

Frontal rain and cloud moved southwards through Scotland, Northern Ireland and northern England this morning. There were also isolated showers in the West Midlands, Wales, and southern England, and spherics were produced in the southwest in the early hours. It was chilly under clear spells in the West Midlands and the south of England, and mist and fog patches formed in the southwest through dawn. A low pressure system continued to dominate the UK weather into later hours, bringing outbreaks of showers for most regions. Scotland, Northern Ireland and northern England saw overcast skies and the most precipitation throughout the day, while parts of the Midlands, East Anglia and southern England experienced dry conditions until midday. After this, the showers spread eastwards, affecting most of the country, and some lighting occurred in parts of the south and east. These showery patches persisted in most areas into the evening, except for Wales, where they cleared away.

Summary of the UK Weather for Tuesday 31 May 2022

A low pressure system sat over the UK in the early morning, bringing bands of showery rain over the country. These became thundery at times, especially in the south and east of the UK, where some spherics were recorded. The areas which remained dry were still overcast, with some parts of southern England reporting fog and mist close to dawn. The bands of showers continued to spread through the country later in the morning, bringing precipitation to most regions by lunchtime. These showers still tended to become thundery at times, with reports of lightning strikes in central and eastern England. Many parts of Scotland and northern England saw the heaviest and most widespread showers in the afternoon. A longer spell of rain affected Northern Ireland in the later hours. Southwest England and southern Wales remained mostly dry after midday, experiencing the best of any sunny intervals in the country. The showers slowly faded into the evening, yet persisted in many areas, particularly in the north and east of the country.

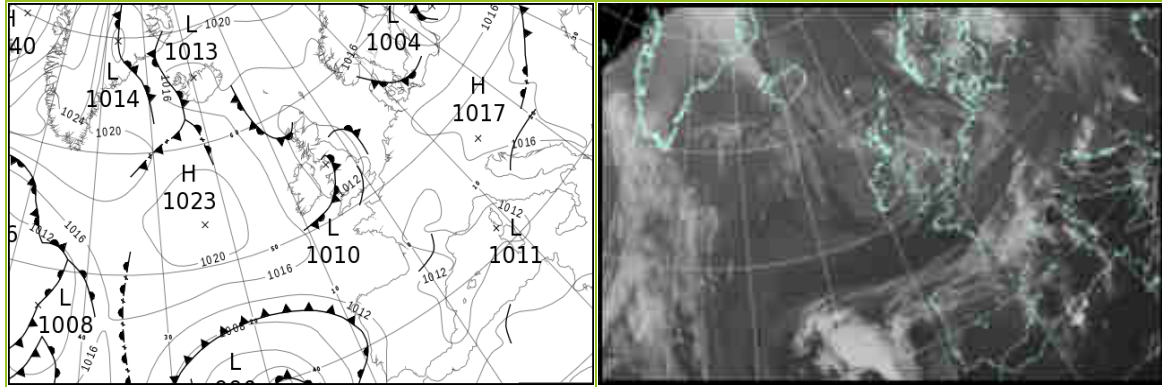

Daily Extremes

<i>Highest Maximum</i>	18.6°C Slapton (Devon, 32mAMSL)
<i>Lowest Maximum</i>	10.5°C Warcop Range (Cumbria, 227mAMSL)
<i>Highest Minimum</i>	11.2°C Hastings (East Sussex, 45mAMSL)
<i>Lowest Minimum</i>	0.0°C Durris (Kincardineshire, 107mAMSL)
<i>Lowest Grass Minimum</i>	-4.9°C Durris (Kincardineshire, 107mAMSL)
<i>Most Rainfall</i>	26.6mm Great Culvert P Sta (Humberside, 3mAMSL)
<i>Most Sunshine</i>	12.8hr Preston, Cove House (Dorset, 44mAMSL)
<i>Highest Gust</i>	34Kt 39mph Dyce (Aberdeenshire, 65mAMSL)
<i>Highest Gust (mountain)</i>	42Kt 48mph Cairnwell (Aberdeenshire, 928mAMSL)
<i>Greatest Snow Depth at 0900 UTC</i>	No non-zero values.

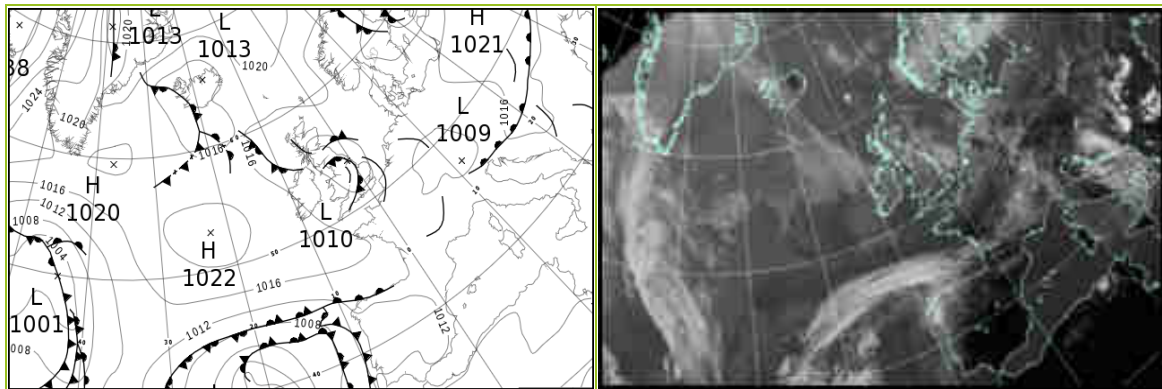

mAMSL refers to station elevation in metres above mean sea level

Daily Weather Summary for Tuesday 31 May 2022

Daily Weather Summary for Tuesday 31 May 2022

None of the selected stations observed a day of sleet or snow falling or non-zero snow depth at 0900 UTC.

Guidance Notes

UTC = Universal Coordinated Time. For the UK UTC is the same as GMT (Greenwich Mean Time).

National boundaries shown on the European station map are for illustrative purposes only.

Daily extremes

- Daily extremes have been manually confirmed by Met Office Observations Quality Management as valid observations from the live database at the time of checking. However, more extreme values may still be possible if they occur after the time of production.
- Mountain stations above 500 masl are excluded from lowest temperatures, highest gust speeds and greatest snow depths at 0900 UTC. This is because they are not considered representative of low level areas.
- Counties quoted against each station are based on historical county boundaries pre-1974 and may not reflect current administrative boundaries.

Analysis charts and satellite imagery

- The satellite imagery is infra-red imagery from the geostationary MSG satellite.
- The rainfall image is derived from satellite data from MSG and rain-radar data. This represents a snapshot of instantaneous rain-rates at 0000 UTC and 1200 UTC and so does not necessarily reflect daily accumulations in the rainfall station map.
- Any analysis charts or satellite images which are unavailable will be displayed as white space.

Station maps

- The UK maps show station data for the same set of stations presented UK data table. These stations are selected to provide good spatial coverage across the UK; they represent only a fraction of the overall UK observing network.
- Wind speed maps show wind speed in Kt and direction both averaged over the hour up to the time of observation. 1 Kt = 1.151 mph.

Hourly station data

- The data tables provide spot hourly observations from synoptic messages at 0000 and 1200 UTC. Missing data are denoted by '-'.

- Pressures are mean sea level pressure in hPa.
- For UK stations, Gibraltar and Jersey, the wind speeds and directions are both averaged over the hour up to the time of observation. However, for European stations wind speeds and directions are both averaged over a 10-minute period up to the time of observation.
- Wind speeds are in Kt. Wind directions are stored in the database every 10 degrees and have been converted to the nearest point of the compass. These give the direction the wind is blowing from, not to.
- Cloud amounts are in Oktas from 0 (clear) to 8 (overcast). 9 indicates sky obscured (eg by fog).
- Air temperature and dew point temperature are in Celsius.

Temperature maps

- Daily maximum, minimum and grass minimum temperatures are in Celsius.
- The period for the daily maximum temperature on day D is defined from 0900 UTC day D to 0900 UTC day D+1.
- The period for the daily minimum and grass minimum temperatures on day D is defined as 0900 UTC day D-1 to 0900 UTC day D.
- On any given day D the minimum will typically occur in the early hours of the morning and the maximum in early afternoon.

Rainfall, sunshine and max gust speed maps

- Daily rainfall is in mm from 0900 UTC day D to 0900 UTC day D+1.
- Daily sunshine is in hours from Kipp and Zonen CSD1 automatic sunshine records. Bright sunshine is defined as exceeding 120 W/m².
- Max gust speeds are the daily max gust in Kt from 0000-0000 UTC

Snow maps

- The day of snow falling map displays data from present weather sensors, showing stations which have recorded sleet or snow falling at any point in the day (0000-0000 UTC).
- The snow lying map shows level snow depth as recorded by the automatic snow depth sensors at 0900 UTC. These snow depth sensors do not record snow depth if this is less than 1cm.
- Snow depth sensors are normally operational from October to April, in the event of snow falling outside this period data availability may be limited.
- Snow maps will only be displayed if one or more of the selected stations on that date have recorded either snow falling or non-zero snow depths. If snow maps are not

displayed it is still possible that other stations in the network have recorded a day of sleet or snow falling or non-zero snow depth.
