## Daily Weather Summaries for November 2017

**If you have any questions or feedback about this product or wish to obtain further data please contact the Met Office.**

This document contains daily weather summaries for each day of November 2017. The Met Office National Meteorological Library and Archive holds a continuous record of daily weather summaries or daily weather reports from 1860, and these daily weather summaries form a continuation of that series.

The purpose of each summary is to provide an overview of the weather conditions across the UK on that day, with the historical emphasis mainly based on observations from surface network of weather stations, although the format has varied over the decades. While the emphasis remains on observations from the surface network, the current daily weather summaries supplement these by including satellite and rain-radar imagery to provide a more complete overview. The current format of the daily weather summaries is as follows:

1. Text summary of the main characteristics of the weather during the day, written by an operational meteorologist in the Met Office operations centre.
2. Table of daily extremes for the UK for key climate variables including temperature, rainfall, sunshine and gust speeds.
3. Overview of the synoptic situation at 00 and 12 UTC comprising: analysis charts showing the surface pressure pattern and associated weather fronts; North Atlantic and European infra-red satellite images showing cloud-cover; combined infra-red and rain-radar images of the UK; maps of wind speed and direction at 00 and 12 UTC; observations of pressure, wind speed and direction, cloud cover, air and dewpoint temperature at selected UK and European stations in data tables.
4. UK maps of key climate variables from observing stations including maximum, minimum and grass minimum temperature, rainfall, sunshine, gust speed and snow.
5. Further guidance notes

If you spot any data errors or omissions in this product please contact the Met Office.

## Daily Weather Summary for Wednesday 01 November 2017

This day's summary created 08/11/2017 02:00

### Summary of the UK Weather for Wednesday 01 November 2017

Overnight it remained cloudy across Northern Ireland, Scotland and northern England with some rain across central Scotland in particular. At times that rain was heavy. Further south it was dry with some clear spells. Under the cloud and rain it was a fairly mild night, but further south where it was clearer it was chilly in a few places, with some patchy frost, but not as cold as recent nights.

There was a north south split in the weather across the UK throughout the daytime on Wednesday. Across Northern Ireland, Scotland and northern England it was mainly cloudy with patchy rain slowly sinking southwards through the day, just about making progress into Northern England by the evening. Across the far north it became brighter a little later in the day, though with a few showers. Across the rest of England and Wales it was a dry and bright day with some warm sunshine for many, allowing temperatures to rise just above the average for the start of November.

### Summary of the UK Weather for Thursday 02 November 2017

It was a generally dry night across the UK. A band of cloud across Northern Ireland and northern England gradually sank southwards to lie over north Wales and the Midlands by morning. There was the odd spot of rain in the cloud band but most places remained dry. Either side of the cloud there were plenty of clear spells. A few showers also affected the east coast of Scotland towards morning. To the south of the cloud, under the clear skies, mist and fog patches developed, especially across central southern and southwestern parts. It was a chilly night under the clear skies. The fog lingered across parts of the south of England into the afternoon when it brightened up. It was generally cloudy across Wales, Northern Ireland and Central England throughout the day, but there were some sunny spells. The best of the sunshine was across the far Southwest of England and also Scotland where it was fairly warm in the sunshine.

### Summary of the UK Weather for Friday 03 November 2017

Friday started cloudy across Wales, Northern Ireland and much of England and Scotland, although with clear skies and fog across parts of south and southwest England. It was a chilly night with some isolated air frosts recorded. Fog in the south of England cleared slowly through the morning, with many places hanging on to the cloud, although some good breaks in the cloud developed across eastern parts of Scotland and England by midday. By evening thickening cloud brought some light rain to parts of the west, but much of central and southern remained dry with clear periods, and with areas of mist forming after dark.

### Summary of the UK Weather for Saturday 04 November 2017

Outbreaks of rain over Scotland and Northern Ireland moved south through the early hours, with clear spells and scattered showers thereafter. Elsewhere there was widespread rainfall across England and Wales, with some heavy bursts in places. By dawn the rain was clearing from Wales and parts of the southwest, with the heaviest rain lying from the Wash to the Severn Estuary. In some parts of the southeast it was cloudy but dry to begin the day, but the rain quickly moved in.

Through the rest of the day, the rain gradually cleared away into the North Sea, with some heavy bursts along the south coast. However, it did not clear parts of East Anglia until mid-afternoon. Otherwise, the rest of the UK saw sunshine and showers, some of which were heavy with a mixture of hail and sleet in the west over higher ground.

Temperatures were slightly colder than average for the time of year.

## Daily Weather Summary for Sunday 05 November 2017

This day's summary created 12/11/2017 02:00

### Summary of the UK Weather for Sunday 05 November 2017

Showers spread across northern and western parts through the early hours of the morning, turning wintry over the highest ground in western Scotland and northern Wales. Elsewhere, lengthy clear spells and isolated showers allowed temperatures to fall, giving a rather chilly end to the night for many.

Through the day, the showers eased across parts of Scotland and northwest England, becoming more isolated in the nature as the day wore on. Showers did continue across parts of Northern Ireland and Wales throughout the day. However, further showers spread in from the North Sea across the north east coast of England during the afternoon. Elsewhere, there was plenty of November sunshine but in that sunshine it felt chilly.

## Daily Weather Summary for Monday 06 November 2017

This day's summary created 14/12/2017 13:02

### Summary of the UK Weather for Monday 06 November 2017

Cloud and rain spread across parts of Scotland through the early hours of the morning, whilst cloud spilled across Northern Ireland in the meantime. Meanwhile, elsewhere the skies were largely clear across the majority of Wales and England, and with light winds, temperatures fell rapidly, leading to a widespread overnight frost here. Mist and fog also formed across many eastern parts of England. The coldest temperatures were across rural Scotland.

Through the rest of the day, the cloud and rain gradually inched eastwards across Scotland and Northern Ireland. It became windy here too. Elsewhere, the skies gradually clouded over across Wales and northern England with occasional rain here. For the rest of England, after any mist or fog cleared, the skies stayed predominantly clear, allowing plenty of November sunshine, whilst temperatures rose well above average for early November in the sunshine along the south coast of England.

This day's summary created 15/11/2017 02:00

### Summary of the UK Weather for Wednesday 08 November 2017

Wednesday started with a slow-moving cold front orientated north-south over east England. This front brought a cloudy night to this part of the UK with patchy, mostly light, rain and drizzle. Across the rest of the UK skies were mostly clear with light winds, which allowed air temperatures to drop to below freezing across parts of the north of the UK, with patches of freezing fog forming by dawn. The front in the east lingered across the far southeast well into the afternoon. Meanwhile, a warm front made progress into the far northwestern of the UK on Wednesday morning and afternoon. Behind this front a freshening southwesterly wind developed, especially across western Scotland. It was a pleasant, sunny day across much of England and Wales. By Wednesday evening the warm front ran across the Isle of Man to Shetland, with low cloud, rain and drizzle affecting northern UK. Cloud continued to spill southeast across the UK with rain reaching the Southwest and West Wales on Wednesday night. It stayed dry and chilly for much of central and southeast England.

## Daily Weather Summary for Thursday 09 November 2017

This day's summary created 29/11/2017 15:40

### Summary of the UK Weather for Thursday 09 November 2017

Cloud and patchy rain gradually moved southeastwards across England and Wales through the early hours of the morning. Meanwhile, Scotland and Northern Ireland saw a mix of clearer spells and occasional blustery showers. Through the morning, the cloud across much of England and Wales continued to move southeastwards, thinning as it did so. The associated rain became increasingly patchy in nature too. Meanwhile, northern England and Northern Ireland enjoyed the best of the dry weather with sunny spells throughout the day here. For Scotland, some saw occasional blustery showers continue, especially in the west. Feeling chilly under the cloud in the south, but temperatures still rose to a high of 15.8°C at Pershore College (Worcestershire).

### Summary of the UK Weather for Friday 10 November 2017

Through the early hours of the day, cloud and patchy rain gradually moved southwards across much of Northern Ireland, England and Wales, whilst blustery showers affected much of Scotland.

Through the day there was plenty of sunshine across much of the UK, with some blustery showers in the north. These turned to sleet and snow over some of the Scottish hills and mountains, where it was windy too. However, later in the afternoon the skies turned cloudy across Northern Ireland and Wales, with light rain and drizzle arriving into the evening.

Temperatures were around average for the time of year.

### Summary of the UK Weather for Saturday 11 November 2017

Cloud and rain moved in from the Atlantic across Northern Ireland, Wales and western and central parts of England, spreading southeastwards through the early hours. Meanwhile, much of Scotland stayed largely dry with clearing skies, although some showers continued to affect the far northeast and the Northern Isles, where it was windy. The clear skies extended into parts of Northern England by the end of the night, where it became chilly.

During daylight hours it was a chilly and bright start in Scotland, Northern England and across into Northern Ireland, with sunny spells. However, a cold northwesterly wind continued to bring showers into northern parts of Scotland and also Northern Ireland. The showers turning increasingly wintry over the hills of Scotland. Meanwhile, cloud and rain, which was heavy at times, continued to move southeastwards across the Republic of Ireland and into Wales, central and southern parts of England, where it has been a rather grey and damp day. Temperatures were colder than average across most of the UK, except for southwest England where it was milder than average.

## Daily Weather Summary for Sunday 12 November 2017

This day's summary created 19/11/2017 02:00

### Summary of the UK Weather for Sunday 12 November 2017

Sunday started off cloudy across much of England and Wales with outbreaks of rain. Across northern England and Scotland there were some clearer skies and showers affecting western and northern parts. The cloud and rain across England and Wales continued to move away to the east, clearing the Kent coast by around dawn. Showers continued to move southeastwards across the western fringe of the UK. It was cold in the north, but milder further south.

Through the morning the wind strengthened and become northerly with localised gale force gusts along coastal areas. Occasionally heavy showers affected parts of both the west and east coast. Showers across northern Scotland gave some snow over the Highlands. The showers in the west eased through the day and the winds also weakened during the evening. It was a chilly feeling day across all parts, especially due to the brisk northerly wind, only a few spots reached double figures.

## Daily Weather Summary for Monday 13 November 2017

This day's summary created 20/11/2017 02:00

### Summary of the UK Weather for Monday 13 November 2017

It was a mainly dry but rather breezy night across the UK, however the winds did ease towards morning. There were further showers along the North Sea coast, especially in the Yorkshire area and across the East Anglia coast. There were also showers affecting the Pembroke Peninsula and parts of east Cornwall and west Devon. Elsewhere, it remained dry with clear skies. Cloud increased across Northern Ireland and Scotland through the second half of the night with rain reaching the far northwest of Scotland by morning. Under the clear skies and northerly winds it was a cold and frosty night for many.

Southern parts of the UK stayed largely dry with bright or sunny spells through the day, although it stayed cold. Cloud and rain continued to spread across the north, mainly affected Northern Ireland, Scotland and northern England. This fell as sleet and snow for a time over Scottish hills, and briefly to lower levels, although there were no accumulations recorded here. It was another chilly day with temperatures struggling to reach double figures Celsius.

## Daily Weather Summary for Tuesday 14 November 2017

This day's summary created 21/11/2017 02:00

### Summary of the UK Weather for Tuesday 14 November 2017

It was a cloudy night across much of the UK with the cloud low enough to bring some patchy hill fog across the Pennines. There were also patchy outbreaks of light rain and drizzle from the Borders region southwards, but many parts remained dry - particularly the southwest. Clearer conditions did edge into northern Scotland towards the end of the night with a few showers just reaching the Northern Isles by morning. It was a much milder night than the previous one, with temperatures in a number of spots considerably milder. During the day clearer conditions continued to nudge into Scotland, and here it was largely dry and bright throughout the day, though it was always rather cloudy across the far west. Across England, Wales and Northern Ireland it remained largely cloudy throughout the day with some low cloud around along with some rain and drizzle, especially in north west England and western Wales. In a few areas there were some bright spells in the afternoon, particularly in eastern England where it felt relatively mild for the time of year.

## Daily Weather Summary for Wednesday 15 November 2017

This day's summary created 22/11/2017 02:00

### Summary of the UK Weather for Wednesday 15 November 2017

Low cloud, mist and fog affected much of England and Wales through the early hours, this most widespread across central and southern areas. The cloud was thick enough to give some light and patchy drizzle too, but it was mild. In contrast, Northern Ireland the far north of England and much of Scotland was colder with clear skies, leading to some frost by dawn. This colder, brighter weather continued across many northern areas through the day, although showers fed in across northern and western Scotland and later it turned cloudier with rain in the far northwest. Across England and Wales, the low cloud, mist and fog was slow to clear, particularly in the southeast. It stayed mostly cloudy through much of the day with further light rain and drizzle in places, although there were some brighter breaks at times too. Temperatures were close to average across northern areas, but in the south it was rather mild with temperatures several degrees above normal for some.

## Daily Weather Summary for Thursday 16 November 2017

This day's summary created 29/11/2017 15:44

### Summary of the UK Weather for Thursday 16 November 2017

It was mild through the early hours for many, with low cloud, mist and some hill fog across southern and southeastern parts of England. Further north, across Scotland a band of rain spread in through the early hours, giving some heavy rain for a time, before this spread into Northern Ireland and northern England. Winds were strong in the far north, with gales around the Northern Isles and other exposed places. By dawn, it started to turn cold in the northwest. The rain continued to push its way southeastwards during the day, gradually fizzling out. Drier, brighter and colder conditions filtered in behind across much of the country. Some blustery showers affected the north and west of Scotland but made little progress inland. The cloud lingered into the evening for some central and southern counties of England, with some light and patchy rain, before soon clearing away. Temperatures were below average across many northern parts, but in some southern areas they were several degrees above average. However, as the colder air pushed in it quickly turned cold for most into the evening.

### Summary of the UK Weather for Friday 17 November 2017

It was cold through the early hours for many parts, with a fairly widespread frost forming across England and Wales, especially inland where the winds were light and skies were generally clear throughout. Showers pushed across parts of northern and western Scotland, some of these heavy and it remained windy with gales across the Northern Isles. A few mist and fog patches formed but these were few and far between, so for most it was cold and frosty. Through the morning the mist and shallow fog readily cleared with much of central southern England and Wales having a dry and bright day with the best of the sunshine in the east. Further north it was breezier with scattered showers along Irish Sea coasts, and with more frequent blustery and locally heavy showers across Scotland where there were gales in the far north.

### Summary of the UK Weather for Saturday 18 November 2017

It remained windy in the far north throughout the day with blustery showers feeding in across northeast Scotland and some parts of Northern Ireland and south west Scotland too. There was a good deal of fine and dry weather around across northern England and Wales along with the midlands and eastern England. However, across southwest Wales and southern England it was cloudy throughout the day with some outbreaks of rain, low cloud and hill fog. Across the south west, temperatures were fairly mild for the time of year, however further north it was much colder with a keen breeze along north sea coasts and strong winds in the far north and east of Scotland.

This day's summary created 26/11/2017 02:00

### Summary of the UK Weather for Sunday 19 November 2017

A band of patchy rain across southern England and Wales cleared slowly to the south through the early hours of the morning, with just a narrow band of rain lingering over Cornwall by dawn. Elsewhere, clearing skies allowed temperatures to quickly fall away leading to a widespread frost in most places, and with a few pockets of fog forming in Wales. Northeast Scotland was breezy with occasional showers, but these tended to die away by morning.

Most of the UK had a bright, dry and rather cold day. Medium and high cloud gradually encroached over the country from west to east. Lower cloud moved into the west later, followed by rain in Northern Ireland and western Scotland during the evening. The highest temperatures were recorded in Cornwall which remained covered in cloud all day.

This day's summary created 27/11/2017 02:00

### Summary of the UK Weather for Monday 20 November 2017

Through the early hours, heavy and persistent rain pushed across northern England and eastern Scotland, before gradually easing by dawn. This gave the first significant snowfall fell over the tops of the Scottish Mountains. Meanwhile across central and southern parts of England and Wales, it stayed largely dry with just some light outbreaks of rain towards eastern England. Temperatures were above average for the time of year overnight with many in mid to high single figures.

The day started on a rather grey note for all with some outbreaks of rain continuing across northern Britain, where it turned heavy and persistent. This band of rain soon pushed southeastwards through the night fizzling out to leave some light patchy rain and drizzle. Some brighter breaks developed through central England and Wales but for most it remained cloudy. Temperatures were generally well above the climatic average apart from north Scotland where it was rather cold.

This day's summary created 28/11/2017 02:00

### Summary of the UK Weather for Tuesday 21 November 2017

It was a mild night for most with temperatures holding up in double figures across much of the UK. However the far north of Scotland stayed in the cold air. Rain spread in across Northern Ireland, northwest England turning heavy in places.

Through the day this rain continued to move northwards into Scotland with further heavy bursts. Elsewhere, it was drier and mild with some brighter breaks, although further wet weather pushed into Wales later on. It remained cold across the far north of Scotland, but otherwise temperatures were very mild again.

This day's summary created 29/11/2017 02:00

### Summary of the UK Weather for Wednesday 22 November 2017

It was an exceptionally mild start to the day across England and Wales, with temperatures well above the average for the time of the year. It was a wet and windy day for many, particularly across Northern Ireland, southern Scotland, northwest England and north Wales, with some heavy and persistent rain, leading to some impacts due to localised flooding, particularly on the roads. It was a colder day across Scotland, with sunny spells and showers. The showers turned wintry over the hills and mountains. Meanwhile, it was mostly dry and bright across the far southeast of England with good spells of sunshine.

Day time temperatures were colder than average across Scotland, but milder than average elsewhere across the UK.

This day's summary created 30/11/2017 02:00

### Summary of the UK Weather for Thursday 23 November 2017

There were outbreaks of heavy rain over England and Wales through the early hours, but these cleared away to the southeast by morning, while an area of sleet and snow across Scotland moved northeast to clear all but the far north by dawn. Scattered showers spread into northern Ireland and parts of Northern England, these accompanied by some blustery winds. From heavy rainfall the previous day, there were reports of flooding across some parts of northern England and north Wales.

During daylight hours the last of the band of sleet and snow cleared from Scotland to be replaced by occasional wintry showers. Further south a band of squally showers moved quickly southeastwards from the Irish Sea, clearing from eastern England in the afternoon. Isolated showers continued elsewhere, with snow falling and settling on the higher ground in the north.

Temperatures were lower than average for the time of year in the northern half of the UK, but around average elsewhere.

This day's summary created 01/12/2017 02:00

### Summary of the UK Weather for Friday 24 November 2017

It was a cold through the early hours across northern and western parts of the UK, with wintry showers and clear spells. Meanwhile, much of the far south of England stayed rather cloudy, with some outbreaks of rain, which moved along the English Channel coast into Friday morning.

During daylight hours it was a cold and frosty start across northern and western parts of the UK, with a few ice patches around. Further showers affected much of Scotland, Northern Ireland and parts of northern England throughout the day, with the showers turning wintry over the hills, with a mixture of rain, hail, sleet and snow in places. After a cloudy and damp start across southern most parts of England, it did brighten up here, although the far southeast continued to see a fair amount of cloud with occasional showers.

Temperatures were colder than average for the time of year.

## Daily Weather Summary for Saturday 25 November 2017

This day's summary created 02/12/2017 02:00

### Summary of the UK Weather for Saturday 25 November 2017

The early hours of Saturday were rather cold. A frost formed widely. There were showers in many western parts, and also some in central southern England. Some showers on high ground fell as sleet or snow. Where showers fell onto frozen surfaces, ice formed. In some places, this lingered into the morning.

During the day, showers continued in the west, spreading into parts of the Midlands too. Again, showers over higher ground fell as sleet or snow. In towns though, snow did not settle. In the south and east, there was lots of sunshine, but it stayed rather cold, and felt even colder in the brisk wind chill.

### Summary of the UK Weather for Sunday 26 November 2017

There were scattered showers across northern and western parts of the UK during the early hours, mainly falling as rain at lower levels but with some sleet and snow over the hills and mountains. Elsewhere it was mostly dry and clear. Winds were quite strong around the coasts but they were lighter elsewhere, and under clearer skies across some eastern and central parts it turned cold with a frost and patchy ice. During the day, showers continued in the west, including a few wintry ones on the hills of Scotland. Eastern parts stayed mostly dry and sunny, but rather cold. In the evening strong winds and persistent heavy rain reached Northern Ireland, the Western Isles and the west coast of Scotland, and then spread eastwards across the UK towards midnight. Temperatures were a little below average but the highest were across the southwest of England.

### Summary of the UK Weather for Monday 27 November 2017

Overnight, a weather system pushed southeastwards across the UK. The rain was heavy at times, and there were gusty conditions along the front. As the rain cleared, colder, showery conditions followed on behind, the showers heaviest and most frequent in the north and west. The showers were wintry over hills in the north. By dawn, the rain was confined to far southern counties of England, with a wrap-around also affecting the Northern Isles. It was a blustery day, especially across northern parts of the UK. The overnight rain, which was heavy at times, cleared southern England during the morning, but much of England and Wales remained quite cloudy with showers. Longer spells of rain also developed across parts of Wales and southwest England into the evening. Brighter skies remained across northern England, Northern Ireland and Scotland through the day, with sunshine and showers. Some of these showers fell as sleet and snow over the higher ground too.

### Summary of the UK Weather for Wednesday 29 November 2017

It turned cold during the early hours of Wednesday with showers continuing to feed into eastern parts of the UK. Some of these showers lead to some snowfall over the hills of Scotland and northern England with some places seeing a light dusting to lower levels in north east England. Elsewhere, was dry and cold with a widespread frost. Rain showers affected western parts of Wales, Cornwall and Northern Ireland. The showers continued to affect eastern counties during the day with some spells of sunshine too. Sleet showers were reported along the east of the Pennines, and for some stations in Scotland. Rain showers still affected the west of Wales and Cornwall, but the rest of the country stayed fine with plenty of sunshine. It remained largely breezy through the day and with the winds coming from the north it felt cold and bitter, particularly on the eastern coast. Maximum temperatures were generally below average for the time of year. Similar weather continued through the evening, with temperatures dropping close to or below freezing by the end of the evening.

## Daily Weather Summary for Thursday 30 November 2017

This day's summary created 07/12/2017 02:00

### Summary of the UK Weather for Thursday 30 November 2017

Scattered showers affected the east coast during the early hours, turning wintry over high ground and then later to lower levels too. Accumulations formed over Scotland and northeast England. Rain showers mostly affected west Wales and Northern Ireland. Meanwhile elsewhere it stayed dry with clear spells, leading to a widespread frost.

Through the day, showers along the east coast made more progress inland. Some heavy thundery showers and "thundersnow" lead to snow accumulations adding up over the North York Moors. Further rain showers continued across west Wales and the south west of England. Elsewhere it was dry and sunny with some fair weather cloud. However for all it was windy and temperatures were below average for the time of year across all parts of the UK.

### Daily Extremes

<i>Highest Maximum</i>	<b>8.7°C</b> Scilly: St Marys Airport (Isles Of Scilly, 31 mAMSL)
<i>Lowest Maximum</i>	<b>0.8°C</b> Dalwhinnie No 2 (Inverness-shire, 351 mAMSL)
<i>Highest Minimum</i>	<b>5.3°C</b> Scilly: St Marys Airport (Isles Of Scilly, 31 mAMSL)
<i>Lowest Minimum</i>	<b>-6.9°C</b> Bewcastle (Cumbria, 133 mAMSL)
<i>Lowest Grass Minimum</i>	<b>-10.3°C</b> Cawood (North Yorkshire, 6 mAMSL)
<i>Most Rainfall</i>	<b>22.8mm</b> Chillingham Barns (Northumberland, 70 mAMSL)
<i>Most Sunshine</i>	<b>7.0hr</b> Bognor Regis (West Sussex, 7 mAMSL)
<i>Highest Gust</i>	<b>46Kt 53mph</b> Orlock Head (Down, 35 mAMSL)
<i>Highest Gust (mountain)</i>	<b>61Kt 70mph</b> Bealach Na Ba No 2 (Ross & Cromarty, 773 mAMSL)
<i>Greatest Snow Depth at 0900 UTC</i>	<b>10cm</b> Fettercairn, Glensaugh No 2 (Kincardineshire, 171 mAMSL)

mAMSL refers to station elevation in metres above mean sea level.

### North Atlantic and Europe analysis charts and satellite images at 1200 UTC

All satellite imagery copyright Met Office and EUMETSAT (European Organisation for the Exploitation of Meteorological Satellites). These show infra-red images from the geostationary MSG satellite. The rainfall rates are derived from both rain-radar and satellite data.

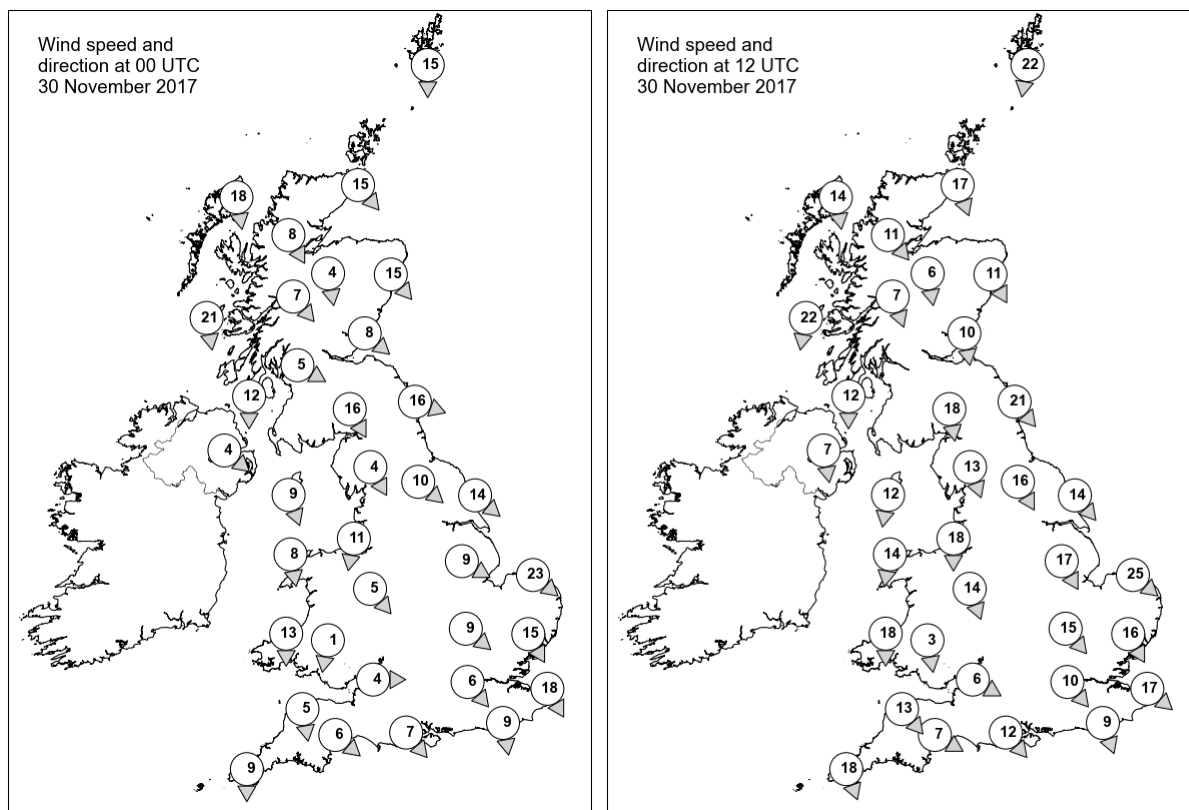

## Daily Weather Summary for Thursday 30 November 2017

## Daily Weather Summary for Thursday 30 November 2017

## Guidance Notes

UTC = Universal Coordinated Time. For the UK UTC is the same as GMT (Greenwich Mean Time).

National boundaries shown on the European station map are for illustrative purposes only.

### Daily extremes

- Data in the table have been manually checked unless denoted by an asterisk.
- Checked values have been manually confirmed by Met Office Observations Quality Management as valid observations from the live database at the time of checking. However, more extreme values may still be possible if they occur after the time of production.
- Asterisked values have been automatically extracted from the live database with no further quality control carried out beyond normal Met Office procedures. This means that some suspect data are possible.
- Duplicate values will be presented if these occur, allowing for up to 10 duplicates.
- Mountain stations above 500 masl are excluded from lowest temperatures, highest gust speeds and greatest snow depths at 0900 UTC. This is because they are not considered representative of low level areas.
- Counties quoted against each station are based on historical county boundaries pre-1974 and may not reflect current administrative boundaries.

### Analysis charts and satellite imagery

- The satellite imagery is infra-red imagery from the geostationary MSG satellite.
- The rainfall image is derived from satellite data from MSG and rain-radar data. This represents a snapshot of instantaneous rain-rates at 0000 UTC and 1200 UTC and so does not necessarily reflect daily accumulations in the rainfall station map.
- Any analysis charts or satellite images which are unavailable will be displayed as white space.

### Station maps

- The UK maps show station data for the same set of stations presented UK data table. These stations are selected to provide good spatial coverage across the UK; they represent only a fraction of the overall UK observing network.
- Wind speed maps show wind speed in Kt and direction both averaged over the hour up to the time of observation. 1 Kt = 1.151 mph.

## Hourly station data

- The data tables provide spot hourly observations from synoptic messages at 0000 and 1200 UTC. Missing data are denoted by '-'.
- Pressures are mean sea level pressure in hPa.
- For UK stations, Gibraltar and Jersey, the wind speeds and directions are both averaged over the hour up to the time of observation. However, for European stations wind speeds and directions are both averaged over a 10-minute period up to the time of observation.
- Wind speeds are in Kt. Wind directions are stored in the database every 10 degrees and have been converted to the nearest point of the compass. These give the direction the wind is blowing from, not to.
- Cloud amounts are in Oktas from 0 (clear) to 8 (overcast). 9 indicates sky obscured (eg by fog).
- Air temperature and dew point temperature are in Celsius.

## Temperature maps

- Daily maximum, minimum and grass minimum temperatures are in Celsius.
- The period for the daily maximum temperature on day D is defined from 0900 UTC day D to 0900 UTC day D+1.
- The period for the daily minimum and grass minimum temperatures on day D is defined as 0900 UTC day D-1 to 0900 UTC day D.
- On any given day D the minimum will typically occur in the early hours of the morning and the maximum in early afternoon.

## Rainfall, sunshine and max gust speed maps

- Daily rainfall is in mm from 0900 UTC day D to 0900 UTC day D+1.
- Daily sunshine is in hours from Kipp and Zonen CSD1 automatic sunshine records. Bright sunshine is defined as exceeding 120 W/m<sup>2</sup>.
- Max gust speeds are the daily max gust in Kt from 0000-0000 UTC

## Snow maps

- The day of snow falling map displays data from present weather sensors, showing stations which have recorded sleet or snow falling at any point in the day (0000-0000 UTC).
- The snow lying map shows level snow depth as recorded by the automatic snow depth sensors at 0900 UTC. These snow depth sensors do not record snow depth if this is less than 2cm.

- Snow depth sensors are normally operational from October to April, in the event of snow falling outside this period data availability may be limited.
- Snow maps will only be displayed if one or more of the selected stations on that date have recorded either snow falling or non-zero snow depths. If snow maps are not displayed it is still possible that other stations in the network have recorded a day of sleet or snow falling or non-zero snow depth.
