## Daily Weather Summaries for May 2021

**If you have any questions or feedback about this product or wish to obtain further data please contact the Met Office.**

This document contains daily weather summaries for each day of May 2021. The Met Office National Meteorological Library and Archive holds a continuous record of daily weather summaries or daily weather reports from 1860, and these daily weather summaries form a continuation of that series.

The purpose of each summary is to provide an overview of the weather conditions across the UK on that day, with the historical emphasis mainly based on observations from surface network of weather stations, although the format has varied over the decades. While the emphasis remains on observations from the surface network, the current daily weather summaries supplement these by including satellite and rain-radar imagery to provide a more complete overview. The current format of the daily weather summaries is as follows:

1. Text summary of the main characteristics of the weather during the day, written by an operational meteorologist in the Met Office operations centre.
2. Table of daily extremes for the UK for key climate variables including temperature, rainfall, sunshine and gust speeds.
3. Overview of the synoptic situation at 00 and 12 UTC comprising: analysis charts showing the surface pressure pattern and associated weather fronts; North Atlantic and European infra-red satellite images showing cloud-cover; combined infra-red and rain-radar images of the UK; maps of wind speed and direction at 00 and 12 UTC; observations of pressure, wind speed and direction, cloud cover, air and dewpoint temperature at selected UK and European stations in data tables.
4. UK maps of key climate variables from observing stations including maximum, minimum and grass minimum temperature, rainfall, sunshine, gust speed and snow.
5. Further guidance notes

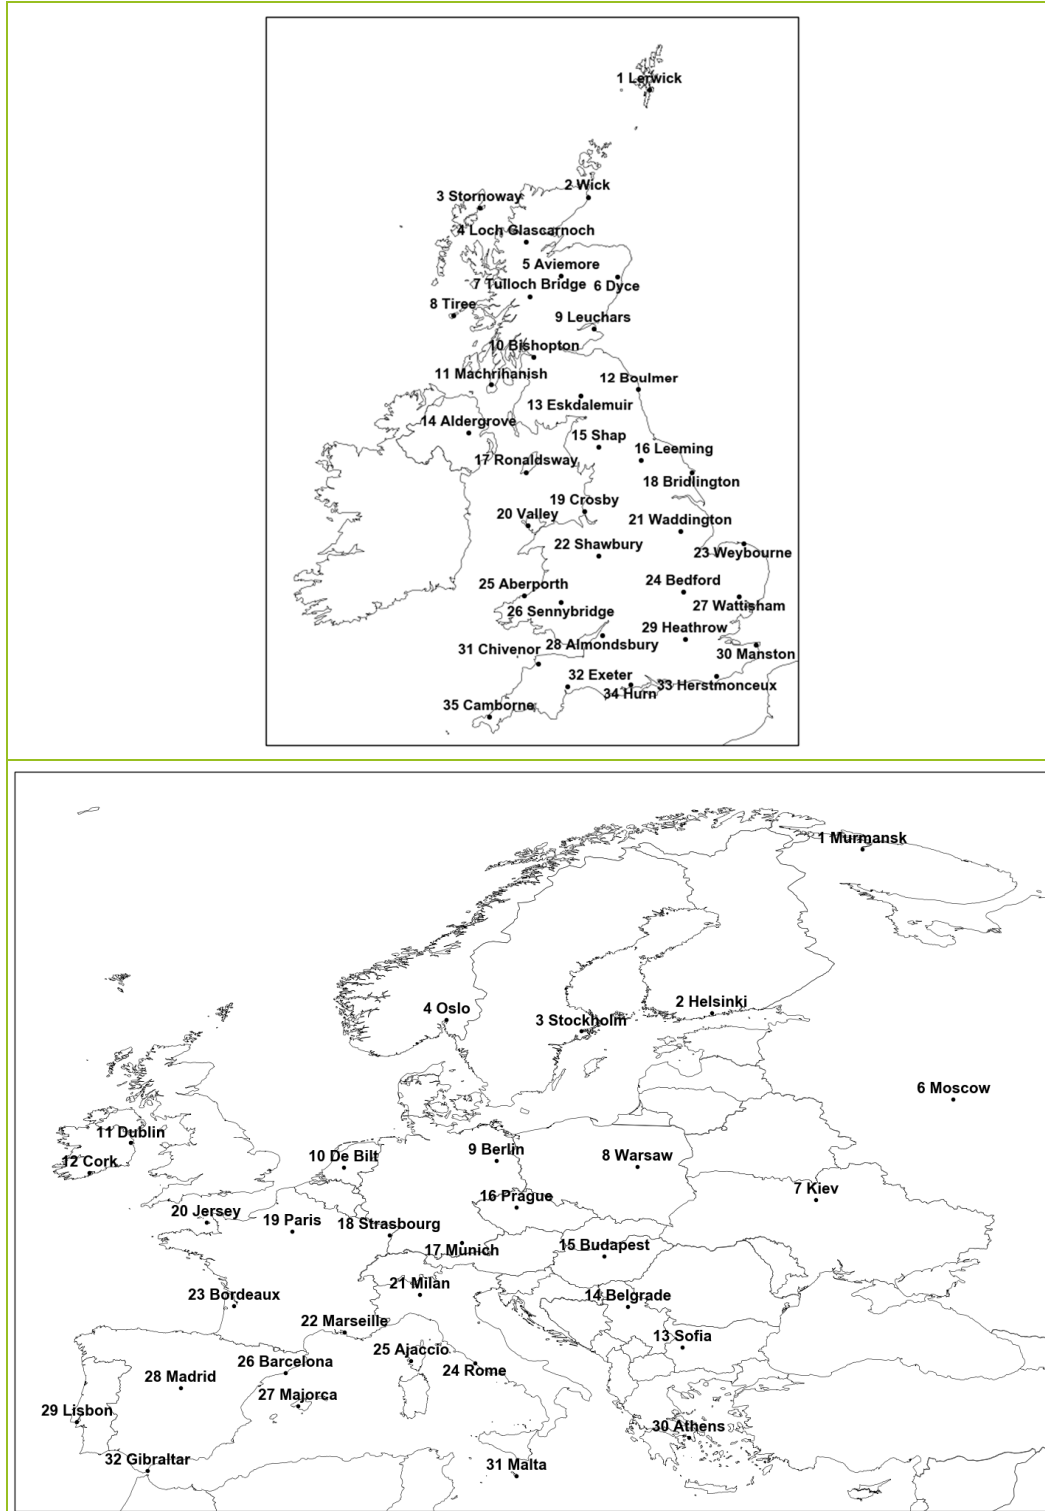

If you spot any data errors or omissions in this product please contact the Met Office.

## Daily Weather Summary for Saturday 01 May 2021

This day's summary created 08/05/2021 03:00

### Summary of the UK Weather for Saturday 01 May 2021

Through the night, a light but chilly northeasterly wind fed patchy cloud and scattered showers into Scotland and the northeast of England. Most other areas stayed dry with clear spells. A few remnant showers over central England, Wales and Northern Ireland fizzled out through the early hours as the patchy cloud there broke up. Around dawn a group of more organised showers moved into Eastern England from the North Sea. Fog patches were reported at various locations across the south of England and it was a widely cold night, with frost for many. Early morning continued similarly to the night, with plenty of sunny spells. Organised bands of rain persisted over western Scotland, parts of Northern Ireland and parts of eastern England. By noon these organised bands had largely faded, but showers were widespread across the country. Some of these showers were heavy, and the southwest saw some thunderstorms. As night fell, the showers began dying down, and by midnight most of the UK was cloudy but dry, with most of the remaining rain focused in Scotland.

### Summary of the UK Weather for Sunday 02 May 2021

At midnight a band of cloud and showers covered eastern and southern Scotland, slowly moving southeastwards into northern parts of England and Wales as night progressed, producing mainly coastal showers. Many places stayed dry overnight with plenty of clear spells, however central and southeast England received a few light showers as did the west coasts of Northern Ireland and Scotland. Light winds allowed some fog patches to form across southern England, with relatively widespread frost. Through the morning sunny spells occurred widely over central and southern England. Patchy cloud limited any lengthy spells over Scotland, northern England and north Wales, which also brought scattered showers. Into midday convective cloud arose over most places producing isolated showers with central and southwestern parts of the UK sunniest. Through the afternoon showers, locally heavy, occurred widely, with the western fringes of the UK driest. Meanwhile cloud increased from the west over Northern Ireland. Into the evening and early night showers gradually cleared whilst cloud spread eastwards into western areas of the UK with strengthening winds over Northern Ireland ahead of widespread rain.

### Summary of the UK Weather for Monday 03 May 2021

Monday started cold, dry and cloudy for most with the clearest conditions over northern Scotland, with showers in far northeast Scotland and east England. However, over Northern Ireland a large band of rain, often heavy, moved east from the Atlantic, accompanied by strong winds. Through the early hours, rain covered all of Northern Ireland with the front spreading over the west coast of Scotland, Wales and northwest England. Through the morning this wind and rain pushed east producing coastal gales along western coasts. Southwest England and eastern UK remained largely dry but cloudy till the afternoon. By mid-afternoon all the UK except northeast Scotland, southeast England and Northern Ireland were under the rainstorm, with thunderstorms over parts of Northern Ireland and southwest Scotland. In Northern Ireland conditions brightened behind the cold front with scattered showers. The rain continued east and by midnight had cleared everywhere but Scotland, though a smaller band of rain formed in Northern Ireland and followed behind it, hitting the west coast and breaking up, covering parts of Wales and north and western England.

### Summary of the UK Weather for Tuesday 04 May 2021

Monday started wet for most of the UK with low pressure tracking eastwards. A band of rain stretched from Northern Ireland through most of central and northern Scotland. Meanwhile, scattered showers occurred throughout England and Wales all accompanied by high winds, especially in the south. Over Northern Ireland and western areas frequent showers occurred with clearer skies between. Through morning thick cloud brought rain, heavy at times across northern England with showery rain occurring over Scotland as the low pulled east. While further south it was brighter with sunny spells and fair weather cloud bringing intense showers into afternoon. Towards the southwest lengthy sunny spells occurred throughout the day with only the odd scattered shower. During the afternoon as the low pulled eastwards showers began to merge diagonally from northwest England to southeast England. Into evening this feature of showers gradually weakened as it tracked south-eastwards. Behind skies gradually cleared with lighter winds and scattered showers, most frequent over northern Scotland.

This day's summary created 12/05/2021 10:33

### Summary of the UK Weather for Wednesday 05 May 2021

A cold and unsettled day. During the early hours a weakening occluded front gradually moved south-eastwards bringing patchy cloud and decaying showers across the Midlands, East Anglia and the South East. Ahead and behind the front it was largely clear with scattered showers in a cold north-northwesterly flow. These showers most frequent over northern Scotland, Northern Ireland and west Wales. Through the night showers fell increasingly as snow to modest elevations over Scotland. By dawn and through morning clear/sunny spells occurred widely over the UK with patchy cloud bringing showers to Northern Ireland, northern Scotland, Wales and into the South West. Although there was plenty of sunshine, fair weather clouds continued to bubble up throughout the day, bringing showers across much of the UK. Many bringing hail and thunder with the most frequent thunder occurring towards the South East. Showers eased into the evening, although a few continued particularly along coasts with continued blustery wintry showers into the north of Scotland. Elsewhere, lengthy clear spells developed allowing for a frost to develop for many.

This day's summary created 13/05/2021 03:00

### Summary of the UK Weather for Thursday 06 May 2021

During the early hours clear spells occurred widely over the UK within a cold northwesterly flow. This brought showers, wintry over high ground, to the north of Northern Ireland and Scotland, along with a few scattered showers pushing into Wales and later tracking southeast into the Midlands and eventually East Anglia by the evening, turning thundery at times. Further south, a front approached the southwest of England bringing cloud along the south coast and outbreaks of rain fringing the far southwest. The majority of rain however stayed over the English Channel. Outbreaks of rain across the southwest soon eased by mid-morning to leave a largely dry day here with plenty of sunny spells, likewise for Wales and Northern Ireland. Further north, outbreaks of rain continued to push southwards affecting much of Scotland throughout the day and turning wintry at times with a strong wind across the western coasts. It was a rather cloudy evening for central and northern UK but elsewhere staying clear which allowed for a frost to develop overnight.

## Daily Weather Summary for Friday 07 May 2021

This day's summary created 14/05/2021 03:01

### Summary of the UK Weather for Friday 07 May 2021

Eastern coastlines of Scotland remained cloud free, as did much of England and Wales, but the rest of Scotland had thick cloud overhead. Smaller tufts drifted southeast over the northwest of England and parts of Northern Ireland. In the southeasterly flow, light showers fell over the Outer and Inner Hebrides, Northern Ireland, the Isle of Mann and inland over Wales. Most winds were light and temperatures quite low for the time of year, resulting in an almost unseasonable frost for many places and snow and sleet over the Highlands.

Frequent showers throughout the day for most of the UK, some of these heavy particularly across the hills and falling as hail and sleet at times. The exception was south and west of England: there they experienced a largely dry day with sunny spells but by evening, cloud started to thicken. A warm front approached the far southwest, more persistent rain affected Cornwall and pushed eastwards through the evening becoming widespread and heavier. Winds also started to strengthen in association with a low pressure system to the west of the UK.

### Summary of the UK Weather for Saturday 08 May 2021

As a deep low began to circumnavigate the British Isles, it dragged two warm fronts and a cold front over the UK. Cloud quickly engulfed the entirety of the UK in the early morning as the warm fronts approached from the Celtic Sea. As it did so, the winds began to pick up along Welsh and Cornish coastlines. Rain fell almost continuously as it approached, but the intensity dropped by the time it reached the midlands. This rain moved northeastwards into Scotland through the morning to engulf the majority of the UK, falling heaviest over the south of Wales. Southern areas of England saw some clear spells at times, along with parts of Northern Ireland and the Isle of Man. This rain eased for many with skies somewhat brightening through the afternoon; areas of Scotland, northern England, and the southeast of England became dry. This remaining band of rain stretching from the southwest through Wales and the Midlands to the northeast of England persisted for the remainder of the day. Evening temperatures were much milder than previous nights.

### Summary of the UK Weather for Sunday 09 May 2021

An area of low pressure to the west of the Ireland brought associated weather fronts across the UK during the early hours of Sunday. Persistent rainfall from a slow moving cold front affected the southwest, Wales and into the northeast England, heaviest in South Wales and gradually eased by dawn. Outbreaks of rain also affected Scotland, particularly in the Outer Hebrides. Clear skies in the southeast but a breezy night for all, with temperatures on the mild side. There were large amounts cloud, although much of this was high cloud, allowing for some bright conditions, the brightest seen over East Anglia. Showers were seen through the morning over the southwest and Wales, with heavier showers over Scotland and Northern Ireland. Through the afternoon these showers amalgamated into a band of rain over the southwest, Wales, and the north of England, with the heaviest rain over the south of Wales. Heavy showers continued over Scotland and Northern Ireland with some seen briefly over East Anglia too. During the evening, heavy showers with thunder edged into Kent from the English Channel.

### Summary of the UK Weather for Monday 10 May 2021

During the early hours, a cold front over the east of England continued to track eastwards bringing persistent and occasionally heavy rain to parts of the southeast and East Anglia through until dawn. Cloudier conditions were seen in central England with scattered showers further west. It was a breezy but rather mild night. As the morning progressed, these scattered showers continued their northeastwards ingress, with most areas being affected by midday. Into the afternoon, the showers became heavier in places, predominantly over the north of England, which saw thunder and numerous lightning strikes. Strikes were also detected along the Welsh border, and in Northern Ireland. Between the showers, it was a largely bright day with variable amounts of cloud allowing for the odd sunny spell. It was quite a mild day, despite the at-times adverse conditions; most areas saw brisk winds, and strong gusts accompanied the heavier showers. Into the evening, most of the showery rain cleared into Northern Ireland and Scotland, with elsewhere dry excluding the far southwest.

### Summary of the UK Weather for Tuesday 11 May 2021

It was a largely clear and dry start to Tuesday for England and Wales with just a few isolated showers over the southwest and South Wales. Further north, persistent moderate rain was seen over southwestern Scotland nudging slightly into northwestern England and the north coast of Northern Ireland. This rain pushed further northwards into Scotland and out of both Northern Ireland and northwestern England through the early hours. Meanwhile, some cloud developed over East Anglia, the Southeast, and parts of the Midlands. Scattered showers readily developed across Wales and central and southern England, ahead of a more organised band of showery rain that made landfall in the southwest around midday. Shortly after, thunderclouds, lightning, and heavy downpours were prevalent across central UK, associated with a trough of low pressure, with notably frequent strikes in north Wales and the West Midlands. Into the evening, these two bands of showery rain continued northwards, with scattered showers remaining quite widespread across western areas. Northern Ireland and southeastern England remained largely dry all day.

### Summary of the UK Weather for Wednesday 12 May 2021

Through the early hours of Wednesday showers were seen over several parts of the UK, notably northern England, the southwest, and southern Wales. Persistent rain was seen stretching from central Scotland over the North Channel into Northern Ireland. The driest and clearest conditions were seen over East Anglia and the Midlands. It was a slightly chilly night with just one location in Northern Ireland recording a sub-zero temperature across the UK. Plenty of showery rain first thing this Wednesday morning across Scotland, Northern Ireland, and north Wales. Meanwhile, scattered showers spotted in south England whilst the rest of England remained largely clear with spells of sunshine. Lightning strikes were detected over east Scotland. Moving into the afternoon heavy downpours were reported over central and southern Scotland accompanied by hail and thunder. Rain persisted across the southwest of the UK and continued progressing northwards through the evening. Elsewhere it remained mostly dry with a few scattered showers affecting central and northern England. It was quite a mild day, especially over the southeast, with some strong gusts over the Scottish coast.

### Summary of the UK Weather for Thursday 13 May 2021

It was a wet start for many in Wales, central, and southwest England, with a widespread area of rain across them. It lingered throughout the early hours of the morning, heaviest over Devon. More showery rain was present across southeast England, and the far north of Scotland. Southwestern parts correspondingly saw quite low cloud, as did eastern Scotland, while the rest of the UK had clearer skies. It was a mild night for most, with calm winds. As the morning progressed an area of cloud covered much of the UK, this produced outbreaks of rain, heavy at times in south England, Wales, and the West Midlands. Meanwhile, elsewhere it remained dry with scattered showers impacting northern England and Scotland. Moving into the afternoon, most of the UK remained cloudy with some short-lived clear spells in northeast England. Rain persisted for south England and Wales, whilst showers in northwestern England became more frequently thundery. Light winds across the UK, mainly chilly but eastern parts feeling relatively warm. Into the evening, the rain over southern England began to fragment and ease.

### Summary of the UK Weather for Friday 14 May 2021

Friday started with a band of rain across parts of Wales and central and southwest England, where it was also cloudy. Eastern parts of the UK were drier, but covered in a sheet of low cloud. Through the small hours and into Friday morning the rain in the south became patchier and lighter in nature. In the east the sheet of low cloud began develop some limited breaks. It was mild for southern areas but cold for northern, with light winds. By the afternoon scattered showers developed across Wales, southwest England, and Northern Ireland. It remained mainly dry elsewhere. The showers became heavy and thundery across Northern Ireland later in the afternoon. Through the evening a second band of rain moved into the far southwest, showers persisted in the west and the east remained dry. Into the night, this brought widespread rain to the Southwest and southwest Wales, the latter seeing heavier downpours.

### Summary of the UK Weather for Saturday 15 May 2021

During the early hours the majority of the UK covered with thick clouds. Meanwhile, a band of heavy rain crossed Wales, which saw thunder and numerous lightning strikes, along with southwest England and Midlands. Scattered showers were observed over Northern Ireland, Scotland and northwest England, while elsewhere remained mostly dry. It was a chilly night overall with light winds and some gales over the south coast. The day saw two main frontal systems track northwards across the UK. These were initially positioned over Wales stretching down to southwest England, and across the Midlands and southeastern parts of England. Through the day, these systems brought periods of rain that were soon followed by frequent showers. Patchy cloud allowed for some sunny spells in the south of England and northern Scotland. Meanwhile eastern areas and Scotland remained largely dry. Showers fell heaviest across Wales and southwest England. Several lightning strikes were recorded across the country, particularly along southeastern coasts. Into the night, showers generally eased, but showers remained prevalent in the west of the UK.

## Daily Weather Summary for Sunday 16 May 2021

This day's summary created 24/05/2021 14:38

### Summary of the UK Weather for Sunday 16 May 2021

An area of low pressure to the southwest of England brought associated weather fronts across the UK during the early hours of Sunday. A band of showers with occasionally heavy downpours, accompanied by thunderstorms affected southwest England, Wales and the northeast England. Scattered showers were also spotted over Northern Ireland and west Scotland. There were clear skies in southeast England but a breezy night for all, with temperatures on the cool side. As the day progressed, the low moved northwards and showers became more widespread throughout the whole of the UK, the heaviest and most organised of which were seen in the south. In the afternoon there was thunderstorm activity frequently reported in the north of England, and hail was also seen. Temperatures were higher than as of late, though still less than average for this time of year. Into the evening the low began to move away to the east, meaning showers began to die out, and became scattered, with only some heavier showers remaining to the southeast of England.

### Summary of the UK Weather for Monday 17 May 2021

The night commenced with showers across the southeast of England, as a region of low pressure slowly tracked towards Kent by dawn. These showers were at times heavy and thunderous, resulting in several lightning strikes being recorded along southeastern coasts. Through the early hours, more organised, heavy showers fell across central Scotland. Elsewhere, localised showers developed across westernmost areas of Wales, Northern Ireland, and northwest England. Most areas however saw dry conditions, with clear spells where breaks in cloud allowed. Into the day showers began to develop further across most of England, Scotland, and Northern Ireland, and these made slow eastward progression through the afternoon. These showers were heavy at times, and frequently brought thunder in some southern locations. The occasional sunny spell was seen between showers, especially across Wales. The evening then saw showers begin to weaken, and progress further eastwards causing most areas to turn dry by midnight, with some clear spells under patchy cloud. The odd shower persisted in eastern Scotland and western Wales, however, and remnant thunder was slow to clear in the far south east.

### Summary of the UK Weather for Tuesday 18 May 2021

In the early hours, showers largely resided along the eastern stretches of the UK, primarily across southeast and northeast England, and eastern Scotland. However, some showers persisted along southern coasts of Wales, and across southwest England, several of these thunderous, with several lightning strikes recorded across Devon. Elsewhere, a few scattered showers lingered over central parts of Wales and Northern Ireland, but most areas remained largely dry. Towards dawn, a group of organised showers approached South Wales and northwest England, causing several thunderstorms to form along coasts. As the day progressed, showers quickly became widespread, though the southeast, Wales and Scotland got the wettest weather. Many of the showers were heavy, and southeast England and Northern Ireland had many thunderstorms. By mid-afternoon a band of rain, heavy in places and occasionally thundery, moved into the southwest from offshore. Overnight, the showers largely cleared, but the rain in the southwest moved north and eastwards, collecting some of the showers in Wales, and making it to the Midlands by midnight.

### Summary of the UK Weather for Wednesday 19 May 2021

The day began mostly dry across the entirety of the UK, with plenty of clear skies. Down in the south, however, it was frequently wet as an organised band of showers tracked eastwards affecting the southwest to start but making progression to the southeast by sunrise. The occasional scattered shower was also seen in the far north of Scotland and across Northern Ireland. A cold night, especially under any clear skies. The day began with the band of showers from overnight continuing to move south and east. More showers sprung up, particularly around Wales, the Midlands and northwest England. These showers were often heavy, frequently thundery and some produced hail. Through the day they moved eastwards, fading offshore in the evening to leave most of England and Wales dry. The showers in north Scotland and Northern Ireland continued for the day, occasionally heavy or thundery. They also faded in the evening, though some remained in eastern Scotland through the night.

### Summary of the UK Weather for Thursday 20 May 2021

The day began with the majority of the UK clear and dry, with only a few scattered showers in the far north or Scotland. However, a low-pressure system approaching from the west soon brought in rain, heavy and persistent. By the morning this had begun to affect Northern Ireland, Wales and the west coasts of England. This low also meant winds began to pick up, particularly in the south west. A chilly night under any clear skies, but milder in areas under any cloud in the west. The low-pressure system continued moving slowly east throughout the day, leaving heavy downpours across Northern Ireland, the northwest of England, and west Wales. Into the afternoon, bands of rain moved across most of the UK, with the driest spots in southeastern England and northern Scotland. Winds were strong across the UK, with severe gales at times across the coasts of Wales, and southern and southwestern coasts of England. The slow movement of the system meant the night was still wet and windy, with the driest conditions again in southeastern England and northern Scotland.

### Summary of the UK Weather for Friday 21 May 2021

Friday began with persistent rain over most of the UK, with northwest Scotland and northeast and central England having the best of the dry weather. The rain slowly moved east through the early hours of the morning. Strong winds were also common, particularly along the south coast of England and Wales, where wind speeds over 50 mph were seen in multiple locations. A low pressure system was still situated over the UK in the morning bringing strong winds and widespread rain, locally heavy. Coastal areas along the south continued to receive the strongest winds. As for rainfall, this was especially heavy over the hills in Wales, northern England, as well as Exmoor. There was also some hill snow over the Cairngorms in Scotland. Into the afternoon, rain persisted across much of the UK, as the system moved eastwards towards the North Sea. In the evening it began clearing western parts of the UK, though much of southwest England, parts of Wales and parts of southwest Scotland saw rain persist all night.

### Summary of the UK Weather for Saturday 22 May 2021

Throughout the early hours of Saturday, most of the UK witnessed rain as a low pressure system tracked east over the North Sea. The heaviest rain occurred over southern England with showery outbreaks of rain over the bulk of the UK. The driest conditions were over inland areas of northwest Scotland. Around dawn, the heaviest of rain began to clear the south coast and showery rain eased inland over England. During the morning skies were largely cloudy across the UK with outbreaks of showery rain at times, mostly towards the south and east. Further west, cloud began to break as sunny spells developed and spread into central areas by midday. Scattered showers with sunny spells continued over Northern Ireland and into northern Scotland with a few showers through the afternoon over the central swathe and eastern half of the UK. Into the evening, sunny spells increased across many western and central areas, with showers gradually fading and clearing east. Temperatures later dropped under clear skies, leading to a rather cold night.

### Summary of the UK Weather for Sunday 23 May 2021

A low-pressure system moved towards the UK from the Atlantic Ocean through the early hours bringing large amounts of cloud into the west, along with rain which spread into Northern Ireland. Further east remained largely dry for much of the night with clear spells. Towards dawn, showery rain spread into Wales, west Scotland and northern England, with heavy rain and gusty winds at times over Northern Ireland. The night was cold for the time of the year, particularly over Scotland and northeast England where places dropped below freezing. Through the morning heavy frontal rain over Northern Ireland intensified into midday, with the development of line convection as it progressed towards west Wales. During the afternoon, there were showers over Northern Ireland, locally thundery. This frontal band of rain progressed eastwards carrying gusty winds and squally line convection with it. Into the evening, clearer and showery conditions followed over Wales, the southwest, and later central and southern areas, as the band of rain began to pivot over northeastern Scotland.

This day's summary created 02/06/2021 08:35

### Summary of the UK Weather for Monday 24 May 2021

A band of rain extended from Scotland down to eastern and southeastern coasts of England. This band of rain pivoting over Scotland, bringing persistent rain across most of its eastern and northern parts, while it cleared England. Meanwhile, showers moved into southwestern UK and northern areas of England throughout the early hours, at times heavy. The night was chilly, particularly under any clear skies, with a few fog patches. Showers affected northern England and Northern Ireland in the morning before clearing to sunny spells. The band of rain and cloud remained over Scotland for much of the day but started to break up during the late afternoon. The showers in the southwest spread across much of Wales and central and southern England though the day. These were frequent, often heavy, and some contained hail. From midday onwards, some of the showers turned thundery. It was a breezy day, especially along southwestern coasts. Most showers eased into the evening as skies partially cleared and the rain over Scotland continued to fragment whilst pushing into Northern England and north of Wales.

## Daily Weather Summary for Tuesday 25 May 2021

This day's summary created 02/06/2021 08:35

### Summary of the UK Weather for Tuesday 25 May 2021

During the early hours, a weakening cyclonic feature over the north of the UK gradually progressed south, bringing cloud and fragmented outbreaks of showery rain over Scotland, Northern England and later into north Wales and the Midlands. Ahead of this and further south, it remained largely dry with clear spells, although some patchy cloud lingered in the far southeast before clearing. Into dawn, variable amounts of cloud occurred over much of northern and central UK bringing patchy outbreaks of rain, with only parts of the southwest and Northern Ireland staying largely clear. The cloud and patchy rain across much of Scotland and England continued southwards during the morning. Whilst another cyclonic feature brought cloud and rain over the southwest from mid-morning through until evening. Showers developed across eastern areas during late morning becoming locally heavy and thundery later. Only parts of Wales and Northern Ireland stayed dry during the day with the best of any sunshine. Into evening, showers gradually cleared eastern Scotland but spread into parts of England, Wales and Northern Ireland, with some coastal fog affecting Cornwall.

### Summary of the UK Weather for Wednesday 26 May 2021

Through the early hours an area of cloud and showery outbreaks of rain pushed south, over much of Scotland and into northern England. Farther south and west, it was largely dry with clear spells, apart from a trough which progressed south bringing patchy cloud and scattered showers over northern England, parts of Northern Ireland and into Wales, the Midlands and East Anglia. Overcast and drizzly weather was experienced under the clouds, mixed with brighter, fair-weather clouds or clear sunny skies elsewhere. Central parts of the UK received most of the cloud, whereas fair-weather clouds bubbled up in south England and Northern Ireland, thickening along the Welsh Marches. Plenty of sunny spells developed in Scotland as well as in northern England. The highest rainfall totals were along the Northern Sea coast. Evening showers in eastern and northern areas eventually died out and left the skies cloudy but dry. A chillier night for those with clearer spells in the south and west areas, with a slight grass frost and some patchy fog in rural areas.

### Summary of the UK Weather for Thursday 27 May 2021

Extensive low cloud was situated over the North Sea and around the top of Scotland during the early hours and this extended inland across the north and east of the UK. Elsewhere, skies were relatively clear with only some high-level cloud around. A couple of showers occurred in eastern England, but otherwise it was a dry night. The clear skies in western areas provided good radiation conditions, causing fog patches to form quite widely and some spots received grass frosts. After dawn, the cloud in the east melted away, as did the fog patches, giving sunny spells for most. Fair-weather cloud bubbled up down the centre of the UK during the late morning, with one or two locations receiving some light rain. Cloud gradually thickened from the west through the day, with only really Cornwall and Northern Ireland cloudy throughout. Into the evening, this frontal cloud continued to spread eastwards, bringing some rain in Northern Ireland, Wales, and western Scotland and England. In the far north and east, skies remained clear, temperatures dropped and a few fog patches formed.

### Summary of the UK Weather for Friday 28 May 2021

As Friday began, thick frontal cloud was positioned along a line joining the Outer Hebrides, Northern Ireland, Wales and the Southwest, and this gradually moved eastwards through the early hours. Outbreaks of rain occurred along the length of this cloud. These slightly weakened as they progressed and had reached as far east as the northwest of England by dawn. Elsewhere, it was a largely dry night with patchy high-level cloud, though the northeast of Scotland received some haar off the North Sea. Very light winds allowed some shallow fog patches to form under the clearest skies. As the morning progressed, rain stalled over western parts, bringing reasonable accumulations to parts of Wales. It remained cloudy for most parts throughout, with thick high cloud allowing for bright skies but little sunshine; northeastern Scotland and southeastern England saw the best of any of this. Into afternoon, rain began pushing northeastwards, fragmenting as it did so, and some locally heavy isolated showers began to form fairly widely over England. It was a mild day but quite warm in Scotland, with light winds nationwide.

### Summary of the UK Weather for Saturday 29 May 2021

The UK sat under a ridge of high pressure at the start of the day, with a frontal system stalled over western parts of the country; this brought low cloud to Northern Ireland and far western parts of Scotland and Wales. The rest of the country saw rather clear skies, apart from northern North Sea coasts which saw a pronounced haar. Winds were light throughout and there was some patchy rain in central England, and from the cloud in the west. Into the morning cloud began to lift generally, but still remained rather low for western parts, with bright skies but little sun here; most saw plenty of sun otherwise. Haar and very low cloud lingered stubbornly across far-eastern Scotland and north east England. It was a dry day for most, with only some very patchy rain over western parts. It was a warm day nationwide, very warm in parts. Into evening, it remained dry but widespread low cloud and sea fog began moving in from the North Sea across eastern areas; western areas saw long clear spells.

### Summary of the UK Weather for Sunday 30 May 2021

Through Sunday morning, most skies remained quite clear. A large area of cloud cleared eastwards from Wales and areas surrounding Devon into St George's channel. Another line of cloud drifted inland from the North Sea driven by easterly winds; some of this haar extended quite far, bringing low cloud and fog to the Firth of Forth, northeast England, East Anglia and north London. Quite a mild night compared to recently, with Wales and western England being the mildest with temperatures in the low teens. Throughout the morning this low cloud persisted over eastern England, central Scotland, and parts of the southwest, however this cleared over large parts of East Anglia to give clear skies. By the afternoon almost the entire UK saw fine and dry conditions under clear skies apart from some fair-weather cloud over western areas. It was a warm day, notably for Scotland and the northwest of England. Winds were light with occasional sea breezes. Through the evening these settled conditions remained with some low-level cloud edging inland from the eastern coast.

### Summary of the UK Weather for Monday 31 May 2021

It was a cloudy, murky start to the week for eastern parts of the country, as low cloud, mist, and fog encroached from the North Sea and reached as far inland as the West Midlands; western parts saw largely clear skies throughout. It was a dry morning despite this, with light winds nationwide. Temperatures were quite mild throughout, but cooler under the cloud in the east. The morning started bright for many, however fog and low cloud over central and eastern England lingered for a time, as well as the occasional cover of high cloud over Scotland and Northern Ireland. This low cloud cleared quite quickly for most through morning, however with haar persisting over eastern coastal areas of England and Scotland. The afternoon, and evening, was fine and dry across the whole of the UK, getting especially warm in the southeast of England, and parts of Northern Scotland. With the long hours of strong sunshine, the UV index was high. Temperatures were much cooler over the east coast from Aberdeenshire to Lincolnshire due to the aforementioned low cloud cover.

### North Atlantic and Europe analysis charts and satellite images at 1200 UTC

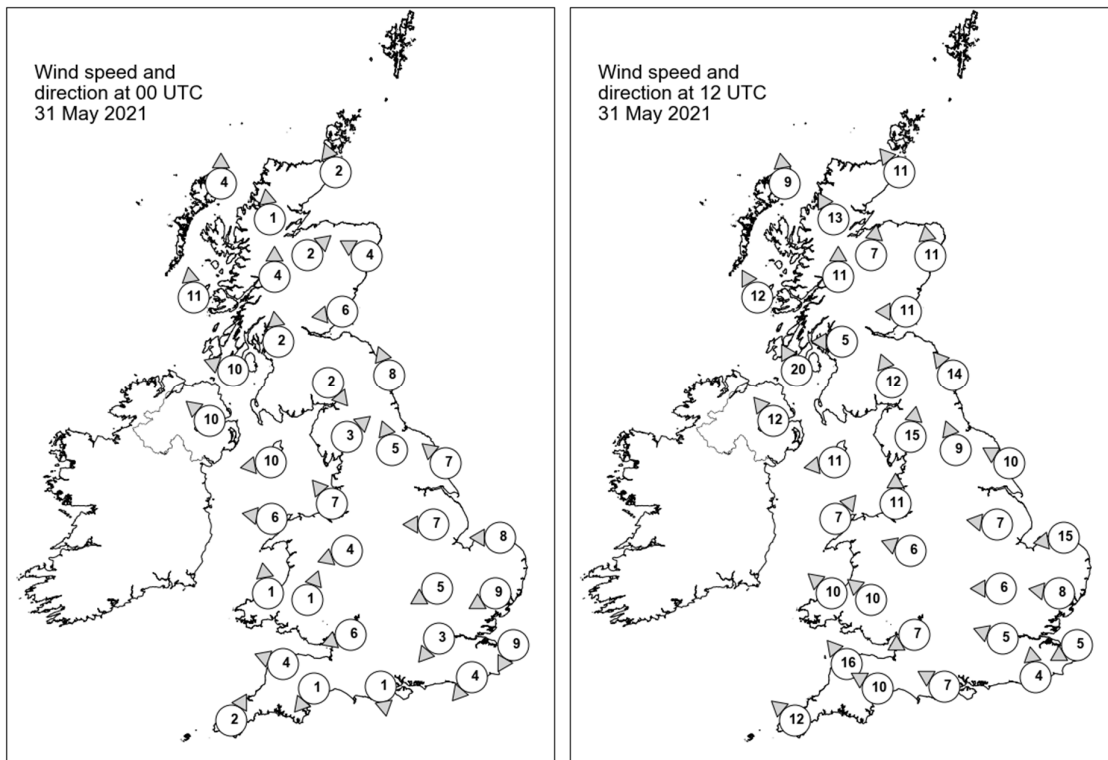

All satellite imagery copyright Met Office and EUMETSAT (European Organisation for the Exploitation of Meteorological Satellites). These show infra-red images from the geostationary MSG satellite. The rainfall rates are derived from both rain-radar and satellite data.

## Daily Weather Summary for Monday 31 May 2021

## Daily Weather Summary for Monday 31 May 2021

None of the selected stations observed a day of sleet or snow falling or non-zero snow depth at 0900 UTC.

## Guidance Notes

UTC = Universal Coordinated Time. For the UK UTC is the same as GMT (Greenwich Mean Time).

National boundaries shown on the European station map are for illustrative purposes only.

### Daily extremes

- Daily extremes have been manually confirmed by Met Office Observations Quality Management as valid observations from the live database at the time of checking. However, more extreme values may still be possible if they occur after the time of production.
- Mountain stations above 500 masl are excluded from lowest temperatures, highest gust speeds and greatest snow depths at 0900 UTC. This is because they are not considered representative of low level areas.
- Counties quoted against each station are based on historical county boundaries pre-1974 and may not reflect current administrative boundaries.

### Analysis charts and satellite imagery

- The satellite imagery is infra-red imagery from the geostationary MSG satellite.
- The rainfall image is derived from satellite data from MSG and rain-radar data. This represents a snapshot of instantaneous rain-rates at 0000 UTC and 1200 UTC and so does not necessarily reflect daily accumulations in the rainfall station map.
- Any analysis charts or satellite images which are unavailable will be displayed as white space.

### Station maps

- The UK maps show station data for the same set of stations presented UK data table. These stations are selected to provide good spatial coverage across the UK; they represent only a fraction of the overall UK observing network.
- Wind speed maps show wind speed in Kt and direction both averaged over the hour up to the time of observation. 1 Kt = 1.151 mph.

### Hourly station data

- The data tables provide spot hourly observations from synoptic messages at 0000 and 1200 UTC. Missing data are denoted by '-'.

- Pressures are mean sea level pressure in hPa.
- For UK stations, Gibraltar and Jersey, the wind speeds and directions are both averaged over the hour up to the time of observation. However, for European stations wind speeds and directions are both averaged over a 10-minute period up to the time of observation.
- Wind speeds are in Kt. Wind directions are stored in the database every 10 degrees and have been converted to the nearest point of the compass. These give the direction the wind is blowing from, not to.
- Cloud amounts are in Oktas from 0 (clear) to 8 (overcast). 9 indicates sky obscured (eg by fog).
- Air temperature and dew point temperature are in Celsius.

### **Temperature maps**

- Daily maximum, minimum and grass minimum temperatures are in Celsius.
- The period for the daily maximum temperature on day D is defined from 0900 UTC day D to 0900 UTC day D+1.
- The period for the daily minimum and grass minimum temperatures on day D is defined as 0900 UTC day D-1 to 0900 UTC day D.
- On any given day D the minimum will typically occur in the early hours of the morning and the maximum in early afternoon.

### **Rainfall, sunshine and max gust speed maps**

- Daily rainfall is in mm from 0900 UTC day D to 0900 UTC day D+1.
- Daily sunshine is in hours from Kipp and Zonen CSD1 automatic sunshine records. Bright sunshine is defined as exceeding 120 W/m<sup>2</sup>.
- Max gust speeds are the daily max gust in Kt from 0000-0000 UTC

### **Snow maps**

- The day of snow falling map displays data from present weather sensors, showing stations which have recorded sleet or snow falling at any point in the day (0000-0000 UTC).
- The snow lying map shows level snow depth as recorded by the automatic snow depth sensors at 0900 UTC. These snow depth sensors do not record snow depth if this is less than 1 cm.
- Snow depth sensors are normally operational from October to April, in the event of snow falling outside this period data availability may be limited.
- Snow maps will only be displayed if one or more of the selected stations on that date have recorded either snow falling or non-zero snow depths. If snow maps are not

displayed it is still possible that other stations in the network have recorded a day of sleet or snow falling or non-zero snow depth.
