

## National Severe Weather Warning Service

### Chief Forecasters Assessment

By Saturday a very strong west to southwest airstream is expected to be in place across much of the UK, but will be particularly strong along, and to the south of, the trailing frontal zone. A wave running along this zone seems likely to supply a further "squeeze" in the Saturday afternoon/ evening period, and it is the extent of this "squeeze" which remains somewhat uncertain - enough perhaps to boost gusts by 10 mph or so.

Because the airmass is stable, this will mean that not only do exposed coasts and hills see very strong gusts, but some potentially damaging gusts may be experienced in the lee of high ground, as for example in northeast England, northeast Wales and southeast Scotland.

The Met Office have issued a **Yellow Warning of Wind**

Valid from **00:05 on Sat, 05th Dec 2015** until **06:00 on Sun, 06th Dec 2015**

Southwesterly severe gales will affect much of northern England, north Wales, Northern Ireland, southern and central Scotland at times during Saturday and overnight into Sunday.

This warning has been updated to separate from Friday's warning, and to increase the expected impacts to medium. The worst conditions seem likely to be during Saturday afternoon and evening across parts of northern England, southeast Scotland and perhaps northeast Wales and the northwest Midlands. Here gusts to around 70 mph are possible even at lower levels, with hills seeing even higher gusts. Elsewhere in the warning area, gusts are likely to be around 60 mph, with some less windy interludes, especially through central parts of Scotland.

Please be aware of the likelihood of travel disruption on roads and ferry routes. Winds may be strong enough to bring down trees and perhaps cause damage to buildings and other structures. A period of heavy rain will also affect much of the area, for which see separate warnings.
