## Daily Weather Summaries for June 2021

**If you have any questions or feedback about this product or wish to obtain further data please contact the Met Office.**

This document contains daily weather summaries for each day of June 2021. The Met Office National Meteorological Library and Archive holds a continuous record of daily weather summaries or daily weather reports from 1860, and these daily weather summaries form a continuation of that series.

The purpose of each summary is to provide an overview of the weather conditions across the UK on that day, with the historical emphasis mainly based on observations from surface network of weather stations, although the format has varied over the decades. While the emphasis remains on observations from the surface network, the current daily weather summaries supplement these by including satellite and rain-radar imagery to provide a more complete overview. The current format of the daily weather summaries is as follows:

1. Text summary of the main characteristics of the weather during the day, written by an operational meteorologist in the Met Office operations centre.
2. Table of daily extremes for the UK for key climate variables including temperature, rainfall, sunshine and gust speeds.
3. Overview of the synoptic situation at 00 and 12 UTC comprising: analysis charts showing the surface pressure pattern and associated weather fronts; North Atlantic and European infra-red satellite images showing cloud-cover; combined infra-red and rain-radar images of the UK; maps of wind speed and direction at 00 and 12 UTC; observations of pressure, wind speed and direction, cloud cover, air and dewpoint temperature at selected UK and European stations in data tables.
4. UK maps of key climate variables from observing stations including maximum, minimum and grass minimum temperature, rainfall, sunshine, gust speed and snow.
5. Further guidance notes

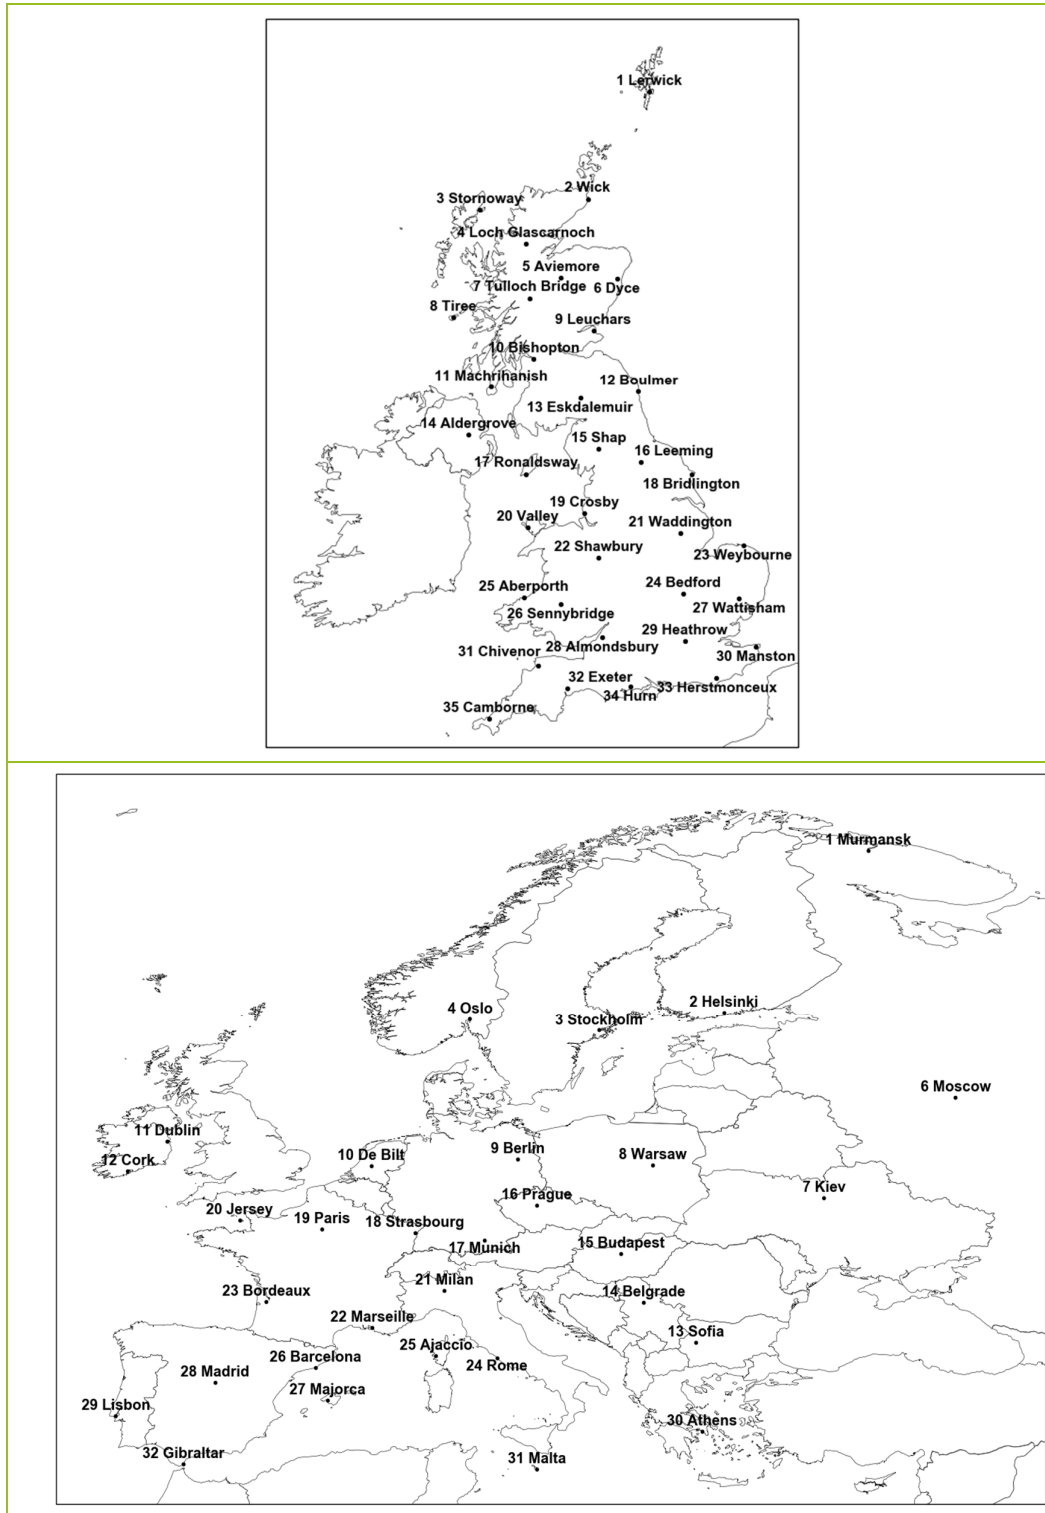

If you spot any data errors or omissions in this product please contact the Met Office.

## Daily Weather Summary for Tuesday 01 June 2021

This day's summary created 29/06/2021 16:15

### Summary of the UK Weather for Tuesday 01 June 2021

It was a cloudy start for eastern parts, as low cloud and fog encroached inland off of the North Sea. Central and western parts had clear skies, except for the extreme west of Northern Ireland and Scotland, which saw some cloud and light rain; it was a dry morning for all otherwise. Winds were light for most, but breezy across northern Scottish coasts. It was another rather mild night for much of the country, with eastern areas cooler under the low cloud. It was another fine and bright day for most with settled conditions across much of the UK. Higher cloud built at a time during the afternoon, however temperatures remained above average, locally very warm, especially in the southeast of England and south Wales. Winds continued to be light, although with a noticeable breeze along the southern coasts. During the evening, dry and clear conditions remained for many except for low cloud slowly moving inland to affect eastern Scotland.

This day's summary created 29/06/2021 16:14

### Summary of the UK Weather for Wednesday 02 June 2021

It was a largely settled start to Wednesday with clear and dry conditions for most. Patchy cloud was seen in places with more widespread cloud seen of the southwest of England, Wales, and Aberdeenshire. Through the early hours rain showers, often turning heavy, pushed their way northeastwards into Cornwall and later Devon. This band of showers gradually moved northwards throughout the day with heavy downpours across Devon and South Wales during the morning. Elsewhere, it was a fine and dry start with temperatures quickly rising, especially in the southeast. During the afternoon the band of showers turned into more persistent rain and drizzle, affecting much of Wales, the West Midlands and into parts of the southeast. By late afternoon, low cloud and fog approached the northeast of England from the North Sea. Otherwise, much of the country remained dry with frequent sunny spells and warm temperatures. By the evening, rain, heavy at times, moved into north and eastern England with variable cloud elsewhere.

This day's summary created 29/06/2021 16:14

### Summary of the UK Weather for Thursday 03 June 2021

Through the early hours of Thursday a band of rain stretching from East Anglia to Northern Ireland and western Scotland gradually pushed north. South of this band skies were largely clear and dry, whereas to the north of this band, cloud cover was more extensive. By dawn this band had broken up into scattered showers over parts of northern England, Northern Ireland, and western Scotland, with elsewhere becoming largely clear and dry. It was generally a warm night. The morning started with dry conditions for many parts of the UK. Cloud covered most places in the west with this producing a few spots of showery rain and feeling chilly for Northern Ireland, northwest England, and southwest Scotland. In the meantime, it was sunny and warm across eastern England as well as central and northern Scotland. As the day progressed and into the evening any lingering rain gradually eased northwards with fine and bright conditions followed over the country. It was a generally warm day for most with southeastern England seeing the warmest temperatures.

### Summary of the UK Weather for Friday 04 June 2021

During the early hours, many areas remained largely dry with plenty of long clear spells. There were a few outbreaks of rain in Northern Ireland, mainly affecting western coasts. As the morning progressed, an area of thicker cloud edged into southeastern England bringing rain across Kent and the southern coast by dawn. A generally mild night, especially in the east. Throughout the morning cloud and patchy rain gradually progressed northwards into parts of south-eastern England and East Anglia. Meanwhile, low cloud and fog patches lingered for a time over Eastern Scotland. Elsewhere it was a fine and bright morning with the temperatures remaining on the warm side. Into the afternoon it was feeling warm in the sunshine across Wales, east Scotland and parts of England whilst clouds and locally heavy rain persisted in the southeast of England. Cloud cleared for the west of the country, however scattered showers were spotted over Northern Ireland and northwest Scotland during the evening.

This day's summary created 29/06/2021 16:14

### Summary of the UK Weather for Saturday 05 June 2021

Saturday began with some patches of light rain affecting East Anglia, easing by the early hours. Cloudier conditions persisted here and across southeast England. Western Scotland and Northern Ireland also experienced some cloudier skies with a few spots of light rain and drizzle. Elsewhere there were plenty of clear skies allowing temperatures to drop and form some local fog patches, these quickly cleared by dawn. The morning saw clear skies through much of the UK, which was situated between two veils of cloud along eastern and western coasts, with the cloud enveloping Northern Ireland. A scattering of showers developed across Northern Ireland through the morning, while elsewhere saw dry conditions through the day, with just a few isolated showers cropping up in the south of England and Wales later in the afternoon. Towards the evening, northern Scotland saw a few organised showers, as the cloud progressed eastwards. Towards midnight, cloud was widespread across the country, with rain just approaching the western coasts of Scotland, Wales, and southwest England.

This day's summary created 29/06/2021 16:13

### Summary of the UK Weather for Sunday 06 June 2021

Through the early hours, a variety of cloud layers covered most parts of the country with fog patches across western England and the Scottish hills. These produced outbreaks of rain over much of Wales and southwest England which later pushed eastwards over central England. Elsewhere it remained dry with south-eastern parts of the country having clear skies. Temperatures were mild in parts of England with cloud-cover but cooler in areas with clear skies. Through the morning, groups of organised showers affected the Midlands, parts of Wales, and the south coast of England, with several thunderstorms recorded along affected coastal areas. While much of England and Wales saw widespread cloud cover, with notable exception to East Anglia and Kent, Northern Ireland and much of Scotland experienced brighter skies. By noon, any remaining showers had tracked across eastern England and eased. Through the afternoon, cloud dissipated in the south, bringing sunny spells across England and Wales. Into the evening, despite showers continuing in the east, thunderstorms broke out across Wales and north Devon. By midnight, many of these showers eased or tracked further north.

This day's summary created 29/06/2021 16:13

### Summary of the UK Weather for Monday 07 June 2021

It was a cloudy, murky start to the week as low cloud, mist, and fog was present in several parts of the country, with Wales, western Scotland, and southern parts of England experiencing the densest patches. Through the early hours, scattered showers, occasionally heavy, were spotted over eastern and northern England, and in parts of Midlands, while elsewhere remained dry with a few clear spells. Into the day, some thicker cloud began to approach across the western coasts of England, Wales, and Scotland, and worked its way eastwards through the course of the day. The cover was patchy however, and allowed for some sunny spells to continue. The east of the UK saw the most of any sunshine and warm weather. A warm day, though temperatures were slightly suppressed under any cloud cover. Into the evening and overnight, any showers in the northeast faded, and the cloud along with them, allowing some clear spells to develop. The occasional mist and fog patch also developed in prone places.

This day's summary created 29/06/2021 16:13

### Summary of the UK Weather for Tuesday 08 June 2021

Tuesday began with scattered, high cloud across the northern half of the UK, though in slightly thicker patches over Northern Ireland, eastern England, and western Scotland. The denser cloud in these parts of England and Scotland brought scattered showers for the first few hours of the day, before clearing, leaving conditions dry and fine throughout the UK. By dawn, skies remained largely clear across central and southern England, though elsewhere saw more widespread cloud cover, with fog patches along the western coasts and hills of England and Wales. Into the day it was fine, dry and sunny for most, with only Northern Ireland and Scotland seeing some thick cloud and the occasional light shower. This cloud migrated southeastwards slowly through the day and began to cover parts of northern England by the evening. Into the night, some stronger showers approached the far northwest, bringing some more persistent light rain to the west coast of Scotland. Elsewhere, cloud cleared somewhat and gave frequent clear spells. Another warm day throughout.

### Summary of the UK Weather for Wednesday 09 June 2021

The early hours of the day saw generally dry conditions, with only northwesternmost areas of the UK seeing any unsettled conditions. Across Northern Ireland, heavier outbreaks of rain lingered in western areas and along coasts, before continuing eastwards across to Scotland. Meanwhile in Scotland, the western coasts saw occasional patchy rain through the night. It remained settled elsewhere, with just stronger, breezier winds all along the western coasts of the UK. Towards dawn, a veil of cloud approached from the west. It was another mild night throughout. Wednesday day started dry and sunny across most of the UK. The main exception was Scotland, which saw persistent rain, heavy in places, throughout the day in the north, and cloud in the south. This rain and cloud headed west through the day, producing some clear spells and largely drying out by the end of the day. Northern Ireland was mostly cloudy throughout the day, while on the west coast of Wales and England sunny conditions soon gave way to cloud and showers moving in from the west, with a band of rain in the southwest. By midnight this cloud had covered most of the UK, though the rain largely stalled in the west, especially in the southwest. It was a hot day for most.

This day's summary created 29/06/2021 16:12

### Summary of the UK Weather for Thursday 10 June 2021

The day began dry, with mostly clear skies throughout the entirety of the UK. In the far north however, a low gave thicker cloud, the occasional spell of light rain and some breezier conditions. In the far south, a trough also meant that some thicker cloud was seen in the south west of England and Wales. It also meant some sferic activity was recorded in Wales. Elsewhere cloud cover was minimal, however, with only the odd bit of low cloud and this mostly being constrained to the west. A mild night. Thursday was a mostly cloudy day across the UK, though there were plenty of sunny spells as well. Scattered light rain and drizzle was largely restricted to the west coast, but occasionally headed further east. A band of persistent rain, often heavy, stayed over far northwest Scotland for much of the day. Towards the evening, this band moved southeast, spreading to more of Scotland and parts of Northern Ireland by midnight.

### Summary of the UK Weather for Friday 11 June 2021

Friday began largely cloudy, with low cloud moving southeast through the early hours covering most parts of the UK. The best of any clear spells occurring in the southeast. In Scotland and northwest England cloud was thick enough to produce some patchy outbreaks of light rain. Early morning fog developed off the western and southern coasts, affecting coastal areas of western Wales and southern England. The rest of the morning continued being largely cloudy, with gravity waves developing widely overland. As a weak cold front progressed southeast it brought the odd outbreak of patchy light rain over parts of Wales and northwest England. Into afternoon, cloud thinned towards the east where some sunny spells developed, especially in the southeast. Across Scotland and Northern Ireland, it remained largely cloudy through much of the day with outbreaks of patchy rain towards the northwest. Through late afternoon and into evening clear spells became more widespread behind the cold front, which brought cloud to the far south and southeast later. Meanwhile, in the far north of Scotland scattered showers occurred with a gusty wind.

### Summary of the UK Weather for Saturday 12 June 2021

Saturday began largely dry but cloudy across the UK, with only a few scattered showers moving east over the far north and into the western coast of Scotland. Through the early hours, variable amounts of cloud occurred over the UK with the best of any clear spells towards the southwest. Around dawn, cloud began to break more widely with some sunny spells developing, especially in the south. Sunny spells also developed towards the east through the morning, with passing amounts of broken cloud across much of the UK. It remained largely cloudy towards northwest Scotland and Northern Ireland as a warm front approached which lasted through the afternoon. Elsewhere, during the afternoon and evening lengthy sunny spells occurred widely across England and Wales, along with central and eastern areas of Scotland. Into the early night clear skies occurred widely, apart from northwest parts of the UK where it was cloudier.

### Summary of the UK Weather for Sunday 13 June 2021

The pre-dawn hours were dry for most. Except for northern Scotland, which received some light rain from frontal cloud. Cloud occurred over north-western areas with clear spells towards the southeast. Mountain wave cloud occurred across much of the northwest and central areas through the morning, and while most of it persisted into the afternoon, occasional breaks allowed for sunny spells. Patchy drizzle fell in northwest England and coastal spots in Northern Ireland, but significant totals were only seen across the Scottish Highlands and Islands. From the late morning, cloud broke and lifted into fair weather cloud for much of central and south England and Wales, yet in Northern Ireland cloud thickened. Despite this, Northern Ireland saw its warmest day of the year so far, as did Wales. The highest temperatures overall were in the southeast, while cooler in the windy northwest. Into the evening, rain continued to move southeast across Scotland and into northern England, with isolated showers following. Most central and southern areas remained dry and clear, with occasional low cloud around western coasts.

This day's summary created 29/06/2021 16:10

### Summary of the UK Weather for Monday 14 June 2021

During the early hours cloud occurred widely over Northern Ireland, Scotland and Northern England, bringing outbreaks of rain as a cold front moved southeast. Further south it was largely clear but still with some patches of cloud. The clearest spells occurred towards the far south and southeast. Into dawn, low cloud approached the western coasts of Wales and later Southwest England, whilst rain on the cold front further north gradually weakened as it progressed southeast. Behind clear spells and a few scattered showers occurred over the exposed northwest. These showers continuing for much of the day. Winds were quite strong, towards the north, with the strongest winds recorded near gale force over the Grampian Mountains. Further southeast it was a hot day with plenty of sunny spells into afternoon leading to England's hottest day of the year so far. As the afternoon progressed, the cold front continued southeast bringing increasing cloud to the south. By evening, variable amounts of cloud occurred over much of the UK with clearer spells developing behind the front. Remaining humid in the southeast, fresher elsewhere.

### Summary of the UK Weather for Tuesday 15 June 2021

Through the early hours it was largely dry across the UK with only a few isolated showers in the exposed northwest. Elsewhere, variable amounts of patchy cloud and clear spells occurred. Cloudiest at first towards the southeast with the legacy of cloud from a clearing cold front. Towards dawn, cloud approached Northern Ireland and western Scotland. The cloud continued to move in from the west as the day progressed, bringing cloudy conditions to the northern half of the country. This brought outbreaks of rain to Northern Ireland though the morning and spread into much of Scotland during the afternoon. It was sunny for much of Wales and central and southern England after skies cleared during the morning. A little fair-weather cloud developed in southwestern areas. Winds were light initially but strengthened across northern areas in the afternoon. The rain over Northern Ireland and Scotland continued through the evening, while elsewhere stayed dry with mostly clear skies.

### Summary of the UK Weather for Wednesday 16 June 2021

A low to the northwest of Scotland dragged along a cold front, which slowly drifted southeastwards over the course of Wednesday. During the small hours, it stretched across Ireland and over most of Scotland, bringing thick cloud here and occasional light rain. There was patchy cloud over Wales and England, and fog patches along the southern coast and Isle of Man, but by dawn most were waking up to a sunny start. The cold front stalled over the Irish Sea and brought cloud and rain to parts of central and southern Scotland, Northern Ireland and west Wales. It was windy across northern Scotland, and few showers developed out of the patchy cloud cover there. The cloud over much of England and eastern Wales cleared during the morning giving sunshine through much of the day. It was a very warm day for England, but elsewhere temperatures remained cool. During the evening, very warm and humid air moved into southern England, bringing cloud and causing heavy showers to develop, some of which produced thunder and lightning, especially in the far southeast.

This day's summary created 29/06/2021 16:09

### Summary of the UK Weather for Thursday 17 June 2021

A cold front slowly moved southeast, lying from southwest England to eastern Scotland, bringing patchy, light rain and a wide blanket of cloud, which smothered most of Britain. Northern Ireland and parts of Scotland saw some clearer skies and light showers here. Thunderstorms from north France moved over Sussex, Kent and Essex, where quite a few lightning strikes were recorded. Kent saw the highest rainfall totals through the morning, but much of south, central and eastern England saw some rain. Showery rain over eastern and southeastern parts of the UK cleared northwards into the North Sea through the morning. Light rain also pushed into Wales and the Midlands from the southwest. Elsewhere stayed mostly fine with many areas seeing sunny spells. During the late afternoon and into the evening, another area of rain moved into central southern England, and then progressed into the southeast during the night. Today felt less warm than in recent days across most of England and Wales.

### Summary of the UK Weather for Friday 18 June 2021

Through the early hours of Friday, thick cloud covered much of England and eastern Wales, and the Scottish Highlands experienced a patchwork of low-lying cloud. Elsewhere received clear skies and early sun. Outbreaks of rain fell over the Home Counties, the Midlands, and East Anglia. Most other areas stayed dry apart from a few light showers over the Outer Hebrides. It was breezy in the southwest. An area of rain moved northwards over southern and southeastern parts of the UK throughout the day. This brought some heavy downpours, as well as some lightning strikes off the coasts of East Anglia. Areas under this rain felt markedly cooler than in recent days. Elsewhere was dry and mostly cloudy, with the northwestern side of the UK seeing the best of any sunshine, particularly Northern Ireland and western Scotland. In the evening, the rain cleared towards the North Sea while the rest of the UK remained largely fine and dry.

### Summary of the UK Weather for Saturday 19 June 2021

Saturday began with outbreaks of rain over East Anglia, but these cleared into the North Sea through the early hours. Cloud covered much of the UK overnight and produced light rain and drizzle over the upland areas of western Scotland and Northern Ireland. Some clear spells developed along a broad swathe of the country linking Cornwall and Aberdeenshire. Strong winds were experienced in coastal areas adjoining the Wash, but winds were light elsewhere. As the morning progressed, the light rain over Scotland and Northern Ireland gradually cleared northeastwards; however, the odd patchier area lingered throughout. Cloud lifted somewhat nationwide as the day wore on, though it was still a gloomy day for most. Into the afternoon, an area of low cloud and showery rain, heavy in places, began moving over the south; the odd thundery shower was also present for the far southeast, and winds became brisk along channel coasts. Cloud cover kept the temperatures subdued and below average for the time of year for most.

This day's summary created 29/06/2021 16:08

### Summary of the UK Weather for Sunday 20 June 2021

A large area of showery rain moved across southern and central UK and gradually died down whilst it progressed northwards. Meanwhile, some showers broke out over southern and northern parts of Scotland. Elsewhere was largely dry through the small hours and cloud prevailed over much of the UK. Further showery outbreaks moved into the far south of England around dawn, and an area of rain approached the Outer Hebrides. As the morning progressed, most areas became largely dry, with overnight rainfall having cleared into the North Sea. The exceptions to this were northern and western parts of Scotland, Northern Ireland, and south coasts of England, which saw patchy outbreaks of light rain and showers throughout much of the day. It remained a cloudy day for most nationwide, with low, overcast cloud prevalent; northwestern coasts saw the best of any clearer and brighter spells, and correspondingly higher temperatures. Winds were light throughout the day, and temperatures remained largely subdued under the cloud cover.

### Summary of the UK Weather for Monday 21 June 2021

Many areas nationwide were dry, with only the South West and parts of northern UK seeing some outbreaks of rain. Meanwhile, a wide area of rain drifted northwards from France across the English Channel and gradually approached the south of England during the small hours. Around dawn time it reached the coast and began pushing further inland into southern counties. Cloud amounts were variable across the UK, and northern areas of Scotland felt rather chilly. As the morning progressed this band of persistent rain lingered over the southwest and southern counties, also pushing into East Anglia. Elsewhere was predominately dry but cloudy with a few bright locations in northern Scotland, Wales, northwestern England, and Northern Ireland. Through the afternoon these conditions remained largely the same, apart from some outbreaks of rain over the Midlands and a few showers breaking out over Scotland and Northern England. Rain eased through the evening with cloud becoming confined to south of a line from the Bristol Channel to the Wash. Temperatures were suppressed under the persistent southwest rain but felt warm in any sunshine.

### Summary of the UK Weather for Tuesday 22 June 2021

It was another largely dry morning for most, with just an area of predominantly light rain over southern and southeastern England. This gradually moved southwards through the morning, easing as it did so. Correspondingly, skies were quite clear nationwide, largely due to a ridge of high pressure that lay over northern England; this allowed temperatures to fall away quickly, and it was a cold night despite the light winds. By midday, most of this rain had cleared, with another band then edging its way into the west of Northern Ireland and the western Isles of Scotland. Most places saw some bright spells with the best of these over eastern Scotland, and western coasts of England and Wales. By the evening conditions had brightened further for England and Wales apart from the South east which saw cloud and isolated showers. Through the evening and into the night this rain over Northern Ireland and Scotland became heavier in places with as it gradually moved further inland. It was quite cool for a June day, although felt quite warm in any persistent sunshine.

### Summary of the UK Weather for Wednesday 23 June 2021

The day began with a well-defined northwest-southeast split across the country. Northern Ireland, Scotland, northern England and northwest Wales lay under a frontal system and saw low cloud and light rain and drizzle through the early hours; this system gradually progressed further southeastwards through morning. Southeastern areas, on the other hand, stayed dry and saw largely clear skies throughout. Winds were light throughout, with mild temperatures post-front, and cooler ahead. The northwest-southeast split continued to dominate during the day, with cloud gradually sinking southeastwards. Outbreaks of rain and drizzle affected northwestern England and much of Wales during the afternoon. Heavier bursts were seen in central Scotland. The southeast of England saw the best of the sunshine, staying dry here with plenty of sunny spells especially in the West Midlands. Cloud gradually reached the far southwest by the evening leaving the clearest spells across East Anglia and the southeast, allowing for temperatures to drop.

### Summary of the UK Weather for Thursday 24 June 2021

Thursday started under cloud for much of the UK, with widespread rain over northwest Scotland and a band of patchy rain which stretched from the southwest to Yorkshire. This band gradually increased in intensity through the early hours. The driest and clearest conditions were to be found over Northern Ireland and the southeast of England. This band of rain associated with a warm front gradually moved southeastwards during the day, bringing cloudier conditions for most and outbreaks of light rain. Further north, a cold front across northwestern Scotland brought more persistent and widespread rain that affected much of Northern Ireland, Scotland and reaching northern England by late afternoon. There were still some bright spells across the UK between any fronts, though with some heavy showers at times too. The far northwest also experienced strengthening winds, with lighter winds elsewhere.

### Summary of the UK Weather for Friday 25 June 2021

Friday started with a large cold front sweeping across much of the UK, arcing from the southwest, over Wales and through the northwest of England into the central belt of Scotland. This saw widespread rain, although this was rather light for most. The clearest and driest conditions were found in Northern Ireland, Northern Scotland, and parts of eastern England. This weather front pushed eastwards through the early hours to cover southern England, the East Midlands, and northern England, leaving Wales and much of the West Midlands clear and dry. In the morning, rain continued across northern England, and northwesternmost areas of Wales, as the remainder of the front in the south cleared southeastwards. Through the afternoon, much of Wales, the West Midlands, and parts of Scotland saw showers quickly form, with many thunderstorms developing across eastern Wales and westernmost areas of the Midlands. Elsewhere continued to stay dry, with southern parts of England receiving the most sunshine. Into the evening and night, the rain eased in the north, but thundery showers continued along the border between England and Wales.

## Daily Weather Summary for Saturday 26 June 2021

This day's summary created 03/07/2021 03:03

### Summary of the UK Weather for Saturday 26 June 2021

Sharp showers across north London, East Anglia and the West Midlands eased by the very early hours. Across Wales, outbreaks of rain gradually moved westwards through the night and into dawn, reaching some parts of the southwest at times. Elsewhere it was a largely dry start though low cloud built into eastern England and southeast Scotland bringing some light rain and drizzle at times. Winds were generally light but breezy across Scotland. Another day of cloudy skies across much of the UK, with the southeast of England receiving the most sunshine. It remained dry through the morning across the country. Later, in the afternoon, a few light showers developed for a brief time across northern stretches of the Pennines, and the Northern Isles saw some rain, though this soon cleared. In the evening, a frontal system approached from the south, making landfall across the southwest of the UK, primarily in Devon and Cornwall. By midnight, further outbreaks had begun to affect the full southern stretch of England, the heaviest of outbreaks initially in eastern areas.

### Summary of the UK Weather for Sunday 27 June 2021

Sunday started largely dry for much of the UK, with the clearest skies across northern, central and eastern England. Scotland saw cloudier conditions for a time but generally clear, sunny skies during the day, whilst Northern Ireland saw the best of the sunshine. Showers along eastern coasts, brought a bit of drizzle to southeastern Scotland but a heavy downpour for north Norfolk. Further south, a band of showery rain progressed northwards from the English Channel through the small hours. Showers turned heavy at times with strengthening winds along the coasts. While some sunny spells appeared along other coastlines and East Anglia, for most it was a murky and dull day with temperatures in the mid to high teens. However, for southern England the persistent rain edged northwards, bringing some very heavy downpours, especially in the southwest. In the evening, more rain reached the southeast and south Wales, some of which turned thundery. Overnight, low cloud across much of the country kept temperatures mild, but slightly chillier further north under patchy cloud.

This day's summary created 05/07/2021 03:05

### Summary of the UK Weather for Monday 28 June 2021

Monday started with a band of rain traversing southern England from Cornwall to East Anglia, largely avoiding Kent and Sussex. Elsewhere remained largely clear and dry, with some cloud over southern Scotland and northern England. Through the early hours this band edged westwards out of East Anglia into the Midlands and Wales. Falling heavy at times, the rain was particularly heavy over the southwest with a few lightning strikes. This persistent heavy rain continued over southwest England, with its fragmenting tail bringing further downpours over the midlands, Wales and northeast England. An occlusion over Scotland brought some cloud and light rain along eastern coasts, otherwise Scotland saw sunshine, along with Northern Ireland and northern England. It was slightly cool, with light winds and maxima reaching the high-teens to low-twenties. Into the late afternoon, skies cleared along southern coasts before cumulonimbus clouds brought heavy showers and a few lightning strikes. By evening, rain lingered but eased over Wales, southern and central England. Cloud persisted over Wales and England, with skies clearer elsewhere.

### Summary of the UK Weather for Tuesday 29 June 2021

The small hours were cloudy for most, with south and central Scotland seeing the best of any starry skies. By dawn the cloud cover had begun to retreat somewhat, with parts of Northern Ireland and north England able to see the sunrise. Scattered light rain fell for the southern half of the UK. Through the morning, clear skies developed in the central UK, although low cloud shrouded coastal areas, especially the north Scottish coast. During the afternoon, patchy outbreaks of rain eased in the south but showers lingered towards the southeast, whilst cloud began to break over Wales and the Midlands. Into the evening and early night, clear spells occurred in the northwest with broken cloud in the south and increasing low cloud with some drizzle in the east. Some showers remained in the southeast and East Anglia.

### Summary of the UK Weather for Wednesday 30 June 2021

A cloudy night and early morning, with only parts of Wales and southwest England seeing any prolonged clear spells. Low cloud brought drizzle and light rain along the eastern coasts of Britain, with some showery outbreaks of rain in eastern parts of East Anglia and the southeast. Winds were generally light across the UK with mist patches forming in a few places in the south: East Anglia, Wales, and the southern coast. Through the morning, sunny spells occurred widely over Wales and the southwest with a few isolated showers developing through midday, turning locally heavy during the afternoon. Further north, cloud occurred widely through the morning, with drizzle at times along the eastern coast. Towards the far southeast and eastern parts of East Anglia outbreaks of showery rain continued at times. During afternoon a few brighter spells occurred over Scotland, and northern and central areas of England with patchy cloud spreading into Wales. Cloud however lingered over eastern areas of England. Into the evening daytime showers faded with patchy cloud in the east and clearer spells further west.

## Daily Weather Summary for Wednesday 30 June 2021

## Daily Weather Summary for Wednesday 30 June 2021

None of the selected stations observed a day of sleet or snow falling or non-zero snow depth at 0900 UTC.

## Guidance Notes

UTC = Universal Coordinated Time. For the UK UTC is the same as GMT (Greenwich Mean Time).

National boundaries shown on the European station map are for illustrative purposes only.

### Daily extremes

- Daily extremes have been manually confirmed by Met Office Observations Quality Management as valid observations from the live database at the time of checking. However, more extreme values may still be possible if they occur after the time of production.
- Mountain stations above 500 masl are excluded from lowest temperatures, highest gust speeds and greatest snow depths at 0900 UTC. This is because they are not considered representative of low level areas.
- Counties quoted against each station are based on historical county boundaries pre-1974 and may not reflect current administrative boundaries.

### Analysis charts and satellite imagery

- The satellite imagery is infra-red imagery from the geostationary MSG satellite.
- The rainfall image is derived from satellite data from MSG and rain-radar data. This represents a snapshot of instantaneous rain-rates at 0000 UTC and 1200 UTC and so does not necessarily reflect daily accumulations in the rainfall station map.
- Any analysis charts or satellite images which are unavailable will be displayed as white space.

### Station maps

- The UK maps show station data for the same set of stations presented UK data table. These stations are selected to provide good spatial coverage across the UK; they represent only a fraction of the overall UK observing network.
- Wind speed maps show wind speed in Kt and direction both averaged over the hour up to the time of observation. 1 Kt = 1.151 mph.

### Hourly station data

- The data tables provide spot hourly observations from synoptic messages at 0000 and 1200 UTC. Missing data are denoted by '-'.

- Pressures are mean sea level pressure in hPa.
- For UK stations, Gibraltar and Jersey, the wind speeds and directions are both averaged over the hour up to the time of observation. However, for European stations wind speeds and directions are both averaged over a 10-minute period up to the time of observation.
- Wind speeds are in Kt. Wind directions are stored in the database every 10 degrees and have been converted to the nearest point of the compass. These give the direction the wind is blowing from, not to.
- Cloud amounts are in Oktas from 0 (clear) to 8 (overcast). 9 indicates sky obscured (eg by fog).
- Air temperature and dew point temperature are in Celsius.

### **Temperature maps**

- Daily maximum, minimum and grass minimum temperatures are in Celsius.
- The period for the daily maximum temperature on day D is defined from 0900 UTC day D to 0900 UTC day D+1.
- The period for the daily minimum and grass minimum temperatures on day D is defined as 0900 UTC day D-1 to 0900 UTC day D.
- On any given day D the minimum will typically occur in the early hours of the morning and the maximum in early afternoon.

### **Rainfall, sunshine and max gust speed maps**

- Daily rainfall is in mm from 0900 UTC day D to 0900 UTC day D+1.
- Daily sunshine is in hours from Kipp and Zonen CSD1 automatic sunshine records. Bright sunshine is defined as exceeding 120 W/m<sup>2</sup>.
- Max gust speeds are the daily max gust in Kt from 0000-0000 UTC

### **Snow maps**

- The day of snow falling map displays data from present weather sensors, showing stations which have recorded sleet or snow falling at any point in the day (0000-0000 UTC).
- The snow lying map shows level snow depth as recorded by the automatic snow depth sensors at 0900 UTC. These snow depth sensors do not record snow depth if this is less than 1 cm.
- Snow depth sensors are normally operational from October to April, in the event of snow falling outside this period data availability may be limited.
- Snow maps will only be displayed if one or more of the selected stations on that date have recorded either snow falling or non-zero snow depths. If snow maps are not

displayed it is still possible that other stations in the network have recorded a day of sleet or snow falling or non-zero snow depth.
