## Daily Weather Summaries for April 2023

**If you have any questions or feedback about this product or wish to obtain further data please contact the Met Office.**

This document contains daily weather summaries for each day of April 2023. The Met Office National Meteorological Library and Archive holds a continuous record of daily weather summaries or daily weather reports from 1860, and these daily weather summaries form a continuation of that series.

The purpose of each summary is to provide an overview of the weather conditions across the UK on that day, with the historical emphasis mainly based on observations from surface network of weather stations, although the format has varied over the decades. While the emphasis remains on observations from the surface network, the current daily weather summaries supplement these by including satellite and rain-radar imagery to provide a more complete overview. The current format of the daily weather summaries is as follows:

1. Text summary of the main characteristics of the weather during the day, written by an operational meteorologist in the Met Office operations centre.
2. Table of daily extremes for the UK for key climate variables including temperature, rainfall, sunshine and gust speeds.
3. Overview of the synoptic situation at 00 and 12 UTC comprising: analysis charts showing the surface pressure pattern and associated weather fronts; North Atlantic and European infra-red satellite images showing cloud-cover; combined infra-red and rain-radar images of the UK; maps of wind speed and direction at 00 and 12 UTC; observations of pressure, wind speed and direction, cloud cover, air and dewpoint temperature at selected UK and European stations in data tables.
4. UK maps of key climate variables from observing stations including maximum, minimum and grass minimum temperature, rainfall, sunshine, gust speed and snow.
5. Further guidance notes

If you spot any data errors or omissions in this product please contact the Met Office.

## Daily Weather Summary for Saturday 01 April 2023

This day's summary created 08/04/2023 03:03

### Summary of the UK Weather for Saturday 01 April 2023

At midnight, a band of rain stretched from Northern Ireland, across Wales, down to southern central England. Meanwhile, the region of low pressure to the east of England similarly brought low cloud and rain to eastern areas. Elsewhere, across Scotland and the north of England, areas remained dry, with exception to the easternmost shores of Scotland. Through the early hours, showers started to develop across southwest England. Northern areas were relatively cool, while it remained mild for most in the south. The occluded front progressed slowly southwest bringing a band of rain which moved across the channel by mid afternoon. The majority of the UK remained overcast with low Stratus cloud throughout. Patchy showers persisted across Northern Ireland. A weakening occluded front reached the East coast of England and brought rain and shower into the evening. Winds remained breezy across the south of England, but gradually weakened inland.

### Summary of the UK Weather for Sunday 02 April 2023

At midnight, cloud covered most of the country with outbreaks of patchy rain and drizzle in central and southern England, and some more organised showers in northwest Scotland. The majority of these eased through the early hours for a dry start. By dawn, cloud had started to clear from the East as Scandinavian high pressure began to take control, bringing sunny spells and a cool breeze along the east and southeast coasts. Skies continued to clear throughout the day as any remaining morning cloud, rain and drizzle cleared to the west. Northern hills in Scotland saw small amounts of drizzle through the middle of the day; elsewhere it was dry and felt pleasant in the sunshine, especially in western regions once the cloud cleared. Parts of western Scotland and Northern Ireland were the only places to not clear completely, with some cloud persisting across these areas into the evening. Elsewhere, as skies remained clear into the evening, temperatures dropped widely after dark producing a widespread frost. Winds were generally light northeasterlies, although were more variable in direction across Scotland.

### Summary of the UK Weather for Monday 03 April 2023

It was a dry start to the week for all under the influence of high pressure, with plenty of clear skies and light winds. Western Scotland and Northern Ireland saw a bit more in the way of cloud, preventing temperatures from falling too low here, but further east a widespread frost formed and isolated fog patches were observed near Tain, Leeming and Powys. It was dry across the whole country throughout the whole day. Most areas had clear skies. Eastern and southern areas had some scattered broken cloud throughout the morning, but this mostly cleared by the afternoon to give blue skies. In the early evening, some cloud started to ease its way into western Scotland. The rest of the country remained clear.

### Summary of the UK Weather for Tuesday 04 April 2023

It was a dry and clear start to Tuesday for the majority of the UK, with some rain in the far west of Scotland. Clear skies allowed for temperatures to drop below freezing in many places, resulting in a widespread morning frost. A frontal band made limited progress from the west, resulting in rain over Northern Ireland, and cloud increasing across the northwest and Scotland. While Northern Ireland and much of Scotland initially started the day under cloud, through the day cloud continued to encroach from the west very gradually. Most of Wales and England saw bright sunny skies, which allowed temperatures to climb throughout the day, and light winds meant it felt mild for most. Westernmost areas of Northern Ireland and Scotland saw a few light showers, with a few reaching northwest Wales and England. By midnight, only East Anglia and southeast England remained under clear skies.

### Summary of the UK Weather for Wednesday 05 April 2023

It was a dry, although cloudy start to Wednesday, with the east seeing the best of any clear skies. As the morning progressed, a frontal band made slow progress from the west bringing rain along the eastern coasts of the UK. This spread eastwards to cover much of northern England, Wales, and the southwest by dawn. It was a calm morning with a frost in places. The frontal band continued its gradual eastwards progression through the day, and began to clear the east coast of Scotland by midday. It tended to persist across England and Wales though, bringing widespread rain, heavy at times, particularly across northern England during the afternoon. Clearer skies developed over western coasts through the evening, though scattered showers followed into the night.

This day's summary created 13/04/2023 03:03

### Summary of the UK Weather for Thursday 06 April 2023

Thursday commenced with a broad band of rain which stretched from eastern Scotland to southeast England, covering much of the east of the UK. As this band gradually tracked eastwards, isolated showers followed behind to the west, with a slither of clearer skies behind a cold front. Most of the rain and showers fell light, though occasionally locally heavy, primarily across high ground. Further cloud followed the brief clear skies from the west, keeping temperatures above freezing for most, with some patchy rural frost. Winds were overall light but strengthened into the morning. Early rain quickly cleared eastern coasts, but showers continued to push east across central and northern England. The morning saw sunny spells develop across the southwest and Northern Ireland. Further showers started to move in from the west, becoming heavy and thundery at times. In the afternoon, these showers became organised for a time across central England. It remained dry for the southwest and Northern Ireland. Showers cleared all but the far southeast of the UK into the evening, with a clear night for many areas.

## Daily Weather Summary for Friday 07 April 2023

This day's summary created 14/04/2023 03:03

### Summary of the UK Weather for Friday 07 April 2023

While there was some sporadic cloud cover along both western and eastern coasts, excluding Northern Ireland, and southwest England and Wales, most areas remained under clear skies through the early hours of Friday. This meant that there were only outbreaks of rain across easternmost Scotland and East Anglia in the twilight hours. Despite winds being light overall, this meant that temperatures fell lower than of late in most places, with the exception of Northern Ireland, with Scotland falling prey to a widespread frost, as well as mist and fog patches elsewhere. Under the influence of high pressure, the weather remained largely dry and settled throughout the day. Low cloud associated with the remnants of occluded fronts lingered in the east but elsewhere there was plenty of sunshine through the morning. Some cumulus bubbled up in places through the afternoon, and the low cloud pushed further inland as evening fell. Towards midnight it turned chillier again, and mist and fog patches reformed across the far south.

### Summary of the UK Weather for Saturday 08 April 2023

It was a clear start for many areas, with low cloud only eastern coasts of the UK. Patchy rain affected eastern Scotland through the early hours, as fog developed in eastern England. By dawn high cloud had spread in from the west affecting the southwest, Wales, Northern Ireland and Scotland. The fog in eastern and southern England slowly burned off over the course of the morning, meaning most areas saw a dry morning with plenty of sunshine. Low cloud persisted in east Scotland for most of the day, lifting in the afternoon to leave widespread patchy cloud. Other than some showers over western Scotland and northwest England it continued to be an otherwise dry and fine day with fair weather cloud bubbling up down the centre of the country. A cold front progressed eastwards into the evening, bringing rain to Northern Ireland and northwest Scotland after dark.

### Summary of the UK Weather for Sunday 09 April 2023

It was a dry night across most of the country, with only the far west of Northern Ireland and the Scottish Islands seeing any precipitation. Elsewhere most areas saw clear spells in between varying amounts of cloud. Some mist and fog lay across East Anglia at midnight, and continued to develop across eastern and central England and parts of eastern Scotland throughout the early hours. The low cloud lifted in central England throughout the morning leaving long sunny spells across much of the region, while the cloud persisted into the early afternoon in the northeast. A cold front slowly moved in from the west, bringing some light precipitation to the Scottish Highlands and Northern Island, which stretched down to the west and southwest of England by mid-afternoon. This front also brought thickening cloud to most regions over the course of the afternoon. An occluded front followed the cold front, bringing reduced visibility, overcast skies and a further band of rain to Northern Ireland by evening, and western regions by midnight.

### Summary of the UK Weather for Monday 10 April 2023

A weakening cold front lay north to south down the centre of the country at midnight, and progressed slowly eastwards over the early hours, bringing rain to most areas, especially across southern and central England. An occlusion followed the first front, behind which skies were clearer apart from some heavy showers, predominantly across Scotland. Generally it was a mild, frost free night with strengthening southwesterly winds. A succession of occlusions and troughs moved eastwards throughout the day, with a small warm sector moving eastwards across the south, resulting in some brighter weather here. During the morning much of the east of the nation had persistent rain, heavy in places, with rain and showers elsewhere in much of the north, this cleared in the south to the east by afternoon. Thunderstorms developed in northern England around lunchtime and into the afternoon, and showers continued in central England and southern Wales. Moderate winds with strong gusts developed in central and southern areas into the evening.

### Summary of the UK Weather for Tuesday 11 April 2023

A decaying occlusion stretched across the country from NW to SE at midnight, bringing scattered, but locally heavy showers to Northern Ireland, the northwest and across central England - pushing east. Showers strengthened over northeast Scotland through the early hours. Elsewhere saw a clearer start to the day, albeit windy, particularly in the southwest and along western coasts. A brief ridge of high pressure developed during the morning, resulting in mostly clear and dry weather for the UK. However a deep low and complex frontal system approached from the southwest, bringing thick cloud and rain, heavy in places. By lunchtime rain was falling over the entirety of the southwest and Wales, and encroaching into Northern Ireland. By the evening the vast majority of the UK was under rainfall, with the exception of eastern Scotland. By the end of Tuesday much of the rain had cleared, except in Scotland, leaving broken showers behind. Winds increased with strong gusts in the south and west during the afternoon and into the evening.

### Summary of the UK Weather for Wednesday 12 April 2023

An occluded front swept eastwards across the length of the UK. Overcast low clouds and rain persisted into the night whilst in this regime; The trailing edge of which brought heavy rain in places - especially London and central Scotland during the evening. Scattered showers followed across England, Wales and Northern Ireland, but widespread rain continued throughout Scotland as the duelling low pressure systems moved erratically eastwards. Occasional lightning strikes were detected in the southwest of England into the early hours of morning, but clearer conditions were more widespread. A system of deep low pressure sat over the UK throughout Wednesday, and was named storm Noa by Meteo France around lunchtime. This resulted in strong gusts for many across the UK, with the strongest winds in the south. A gust of 101mph was recorded in St. Agnes, Cornwall. A system of occluded fronts and troughs dominated by the storm resulted in heavy rainfall and showers for many, with some sunny spells interspersed. Thunderstorms developed in parts of southern central England, Wales and the south through the afternoon.

This day's summary created 20/04/2023 03:04

### Summary of the UK Weather for Thursday 13 April 2023

A low pressure system sat over northern England and Scotland through the early hours of the morning, with a large occlusion running across the country bringing showers, locally heavy, to large parts of western Scotland, northwest England, the Midlands and the south east. This rain moved progressively eastwards through the early morning and started to break up by 0600. Westerly winds were particularly strong in the south earlier in the morning, calming down towards dawn. A low pressure area with accompanying occluded fronts progressed westward across Scotland during the day bringing showery conditions to the northern isles, northwest Scotland and northern England. Elsewhere, a trough progressed across the south of England bringing sharp showers. These dissipated through the day. Temperatures were generally lower than average. Winds eased through the day to be generally light by evening.

### Summary of the UK Weather for Friday 14 April 2023

Shortly before midnight a frontal system began to push in the southwest of England, bringing with it widespread rain. This continued to track northeastwards, with rain affecting much of England and Wales by dawn. Eastern England remained dry with clear skies initially. Further north a band of heavy rain pushed north into the far northwest of England and Southwest Scotland in the early hours. Much of Scotland and Northern Ireland remained dry, however there was some occasional rain and showers through the night, turning heavy at times near Aberdeen shortly after midnight. The area of low pressure and associated frontal system tracked southeastwards through the day, continuing to bring cloud and rain over southern areas. Showers bubbled up in northern England and southern Scotland, banding into more organised areas of rain, with hail and thunder in places. A ridge of high pressure began to push into the west of the country in the late afternoon, and showers in Northern Ireland and Scotland subsequently faded away. Evening rain continued over eastern, central and southern UK, but slowly began to ease later in the night.

### Summary of the UK Weather for Saturday 15 April 2023

A depression to the south of the country brought some rain and showers to the eastern half of England, which progressed eastward through the night. The showers were heavy in places. The rain cleared all but eastern coasts by 0700. Elsewhere had a dry night with light cloud and clear spells. The winds were generally light throughout the country. Temperatures were low, reaching freezing in sheltered areas under clear skies in the north. High single figures at best in the south. Rain over southeast England gradually cleared, lingering somewhat over the Kent coast towards midday as cloud began to break up elsewhere. Most places remained dry and clear for a brief period, until a warm front pushed eastwards across Northern Ireland, bringing a more organised band of rain that continued to Western Scotland by early evening. On the eastern coast, some scattered showers recirculated, some locally heavy with outbreaks of hail/TS, particularly over the southeast.

This day's summary created 23/04/2023 03:04

### Summary of the UK Weather for Sunday 16 April 2023

Occluded and warm frontal systems to the northwest of the country brought rain and drizzle initially to Northern Ireland and the western isles, progressing slowly westwards through the night. By morning the rain had reached into the central belt and southwest Wales. Elsewhere had patchy cloud and clear spells. The frontal systems cleared Northern Ireland by morning bringing brighter weather here. Cloud persisted across the country for most, with some thick enough to bring about patchy rain and drizzly outbreaks, particularly along western upslopes, through the day. Elsewhere cloud was patchy, with eastern areas seeing the best of the sunshine. Some low cloud settled over the northwest later into the evening while spots of isolated fog developed elsewhere. It was a mild day compared to recent weeks.

### Summary of the UK Weather for Monday 17 April 2023

It was a fairly cloudy night across the country. Patchy drizzle was spread across central and eastern England at midnight, and slowly sunk southwards through the early hours, with further showers over windward upslopes in Wales. Low cloud, patchy mist and fog developed across the country, but predominantly along eastern coasts before dawn. A ridge of high pressure pushed across the UK from the northwest, continuing the southern track of drizzly outbreaks which had mostly cleared the south coast by 1100. In general, overcast conditions remained for much of the west, while eastern coasts stayed clearer but endured cool northerly winds. Low cloud began to develop over North Sea coastal areas into the early evening, progressing westwards across central and southern England later into the night.

### Summary of the UK Weather for Tuesday 18 April 2023

It was almost entirely dry overnight in the UK, with just a few patches of drizzle scattered over Scotland. Low cloud affected many areas, with fog reported in northeastern England through until dawn. The low cloud gradually started to clear from East Anglia around 0500Z. Cloud bases were generally higher in the west, although later in the night low cloud began to spread into southwest England. The morning started with a band of cloud across the centre of the UK, covering most areas except the easternmost regions. This band of cloud moved westwards through the morning, leaving clear skies behind. It had cleared the west coast of the UK by 1100, with only a few areas of scattered cloud remaining in Scotland and Wales. From 1200, cloud started to enter the southeast, moving westwards through the afternoon to cover most of south England. Further north, skies were clear. This continued into the evening with cloud continuing to move westwards, leaving some southeastern areas clear. It was a completely dry day across the whole country.

### Summary of the UK Weather for Wednesday 19 April 2023

For most of the country it was a fine and dry night, clear skies and light winds brought temperatures down lower than recent nights, particularly in central and eastern Scotland, and the northeast. It was a cloudy start for some across Wales, central England and the south coast, bolstering milder temperatures against the cool northerly flow but bringing some showery outbreaks, mainly to the southwest, during the early hours. Most of England and Wales started cloudy with patches of rain, but this cleared from westwards to give most a dry, clear day. Scotland had a sunny day. The cloud cleared most areas by evening to give a dry, clear night. The day started with light winds throughout. These picked up to moderate for a time in the south, but died down in most areas overnight. A chilly morning warmed up quickly, reaching the mid-teens in most areas. Eastern coasts remained cooler in the easterly breeze.

This day's summary created 27/04/2023 03:03

### Summary of the UK Weather for Thursday 20 April 2023

It was a clear, dry start to the day for most due to dominating high pressure to the northwest. There was very little in the way of cloud other than some stratus for parts of central and eastern England, and some isolated fog in northwest Scotland. Light to moderate winds brought a chill to the air, with localised air frost in elevated rural spots. The day started bright and sunny for most with occasional cloud. Cloud, then rain moved in to the southeast, spreading across most of England. The rain reached the midlands by the end of the period with the cloud extending across England and Wales. Scotland and Northern Ireland remained clear. Winds were initially strong in the southwest. The rest of the country started with light winds. The wind strengthened in the southeast, but remained light for Scotland and Ireland. Temperatures reached mid to high teens in Western areas, cooler on eastern coasts.

### Summary of the UK Weather for Friday 21 April 2023

The start of Friday was characterized by a north/south split, with clear skies in north and cloud in the south. From the early hours a band of organised rain, as a result of an occluded front, moved in from the east over East Anglia; this progressed into the midlands and southeast England through the morning. Calm and clear conditions resulted in a chilly night for Scotland, allowing some localised frost to form. It was a warm and dry day for Scotland, Northern Ireland, and northern England under lengthy sunny spells. Cloudy and wet conditions persisted over central England and northern Wales, the most impactful of which were in Yorkshire and Lincolnshire. Further south, rain broke up into showers, becoming particularly heavy with thunder between Bournemouth and Exeter under a convergence line after midday. Skies became clearer in southern England and Wales through the evening, allowing temperatures to drop and some mist and fog to reform overnight.

## Daily Weather Summary for Saturday 22 April 2023

This day's summary created 29/04/2023 03:02

### Summary of the UK Weather for Saturday 22 April 2023

Overnight, a band of rain lingered across the north of England, moving slowly northward to cover Northern Ireland and southern Scotland by morning. The rest of Scotland and southern England had a dry night with clear skies or scattered cloud. Winds were generally light. Temperatures fell off quickly under clear skies in the north and south down to low single figures with isolated frost, especially in the north. It was a few degrees warmer under the cloud cover. Through the morning a band of cloud and rain, locally heavy sat across northern England and Northern Ireland. This moved westwards, leaving behind scattered showers in northern areas for much of the morning. The rest of England was covered in rain for most of the day. Scotland had much clearer and drier conditions, except in the far northeast. Into the afternoon, rain arrived into southwest England and south Wales. This band spread northeastwards into the evening, leading rain in the west Midlands into the night.

## Daily Weather Summary for Sunday 23 April 2023

This day's summary created 30/04/2023 03:04

### Summary of the UK Weather for Sunday 23 April 2023

A series of frontal systems brought rain and showers across most of England, although the southwest remained largely dry. A cold front brought rain into northern Scotland by early morning. Winds were generally light, strengthening in the north by early morning. It was a chilly night, with temperatures only reaching 10 degrees C in the south, and single figures elsewhere. As low pressure moved eastwards throughout the day, winds turned more northerly, bringing colder conditions for Scotland and northern England. Outbreaks of rain pushed northeastwards across Kent, Sussex and Greater London through the morning, these heavy at times. The rain became confined to East Anglia by the evening, eventually clearing overnight. Elsewhere across the UK, it was a day of sunshine and showers, these also locally heavy, with thunder and lightning observed in central and southern England and Wales during the late afternoon. Showers in southern areas eased overnight, whilst showers in Northern Ireland became more organised, and those in the far north turned wintry.

## Daily Weather Summary for Monday 24 April 2023

This day's summary created 01/05/2023 03:03

### Summary of the UK Weather for Monday 24 April 2023

It was a largely dry start to the week, with scattered showers affecting parts of north and east Scotland, north Wales, and eastern England. Meanwhile, a cold front pushed south across Northern Ireland through the morning, bringing widespread rainfall. As the early hours progressed, scattered showers developed to more organised rain in North Wales as the cold front continued to progress southwards, with rain reaching areas of central England by dawn. Cloud cover was patchy, especially in the south, and a patchy ground frost formed under any clearer skies. The south of Wales saw clouds converging in the morning, with some lightning strikes detected. Embedded thunderstorms tracked southeastwards bringing low cloud, overcast skies and precipitation across the south of Wales and the south of England throughout the morning. Heavy rain followed in the afternoon, especially in central England, Greater London and western coasts. Patchy cloud and showers followed the northerly arctic flow down through Scotland throughout, becoming wintery in the mountains, and producing hail at times in northern Scotland. Temperatures dropped into the evening causing widespread overnight frost.

### Summary of the UK Weather for Tuesday 25 April 2023

A high-pressure system over the UK lead to a dry start to the morning for most of the country with clear skies for most as well leading to low temperatures and patchy frost. Showers were isolated to the northernmost parts of Scotland. As the morning progressed, a crisp northerly wind from the arctic brought more scattered cloud coverage and showers, wintry in the high ground, in the northern parts of Scotland. A dry day for most, with cloud becoming more widespread throughout the afternoon as an occluded front approached the southwest of England, although visibility remained good. This frontal feature was coupled with a band of light showers which arrived in the southwest of England in the early evening.

### Summary of the UK Weather for Wednesday 26 April 2023

A ridge of high pressure dominated the skies during Wednesday morning, bringing a mostly dry start to the day. There was plenty of cloud cover however, with most places overcast and some drizzly spots in places. Some wintry showers persisted in parts of northeast England and northern Scotland also. Low temperatures in the north brought about patchy frost in places, particularly across the Scottish Highlands. A set of occlusions edged toward the southwest during the early hours, bringing about more in the way of scattered showers by dawn. The day started mostly cloudy except for some sunshine in the north. The cloud generally thinned throughout the day. Although some areas in southwest and northern England, also northern and eastern Scotland experienced showers during the afternoon. Light northerly winds in the north of Scotland and southeasterly in the south of England, with some stronger gusts accompanying showers. It remained chilly for the time of year with the best temperatures in the north west and north Wales.

### Summary of the UK Weather for Thursday 27 April 2023

Low cloud persisted overnight and into the morning in the southwest, bringing overcast skies and poor visibilities. A band of showers swept eastwards across west Scotland and Northern Ireland as low pressure systems and occluded fronts arrived. By early morning showers had also reached the Lake District and spread across most of Scotland. Winds remained gentle overnight for most of the UK. The rest of the morning was wet in Scotland, Northern Ireland and the southwest with a low pressure to the west casting a mixture of fronts across the country. The rain persisted in Scotland and spread eastward across England and Wales and clearing the southwest by early evening. East/southeasterly winds blew across the country. Initially light, they strengthened to moderate in any rain. It was chilly in the north with frost in places, although much warmer in the south where temperatures reached the mid-teens.

### Summary of the UK Weather for Friday 28 April 2023

As the night progressed, extensive low cloud in the southwest persisted with overcast skies for many. Poor conditions spread throughout the UK as multiple occluded fronts moved northeastwards, bringing widespread low cloud and fog, and therefore poor visibility. Rain affected predominantly the east of England, Northern Ireland and northern Scotland, persisting in northern Scotland into the morning. Feeling much milder overnight compared with previous nights. Dry conditions remained across the southern half of the country for much of the day, although some short-lived, light showers developed over East Anglia mid-morning. In Northern Ireland, cloud cover remained for much of the day, with a few light showers arriving later. Further north, rain has generally eastern coasts by midday, before some more showers developed for central Scotland, pushing slowly southeastwards through the afternoon and into the evening. Meanwhile, clear skies were developing in the southwest, remaining in place until evening, when some lower cloud returned. Central and eastern parts saw some late sunshine.

### Summary of the UK Weather for Saturday 29 April 2023

Mostly dry with some rain in eastern Scotland and the far southwest. Scattered clear spells elsewhere. The rain cleared England giving most a dry and clear night with scattered cloud. The cloud thickened in northern Scotland, giving rain in places. However, the far north remained clear. Some fog in the eastern midlands. Winds were generally light. It was chilly in Scotland with frost in places. Warmer further south with temperatures remaining in the low teens in the far south. Low cloud and fog was slow to clear southwest England and Wales in the morning. Scotland saw scattered showers, although less so as the morning went on. Showers, some locally heavy, started to develop in Wales and across the Midlands into the afternoon. These became heavier throughout, with spherics also recorded. These conditions were also seen in Northern Ireland with widely heavy, thundery showers. Southern areas had sunny spells for much of the afternoon with cloud dominating further north. Scotland was dry for most of the afternoon but covered in a thick layer of cloud. Into the evening, showers in the Midlands dissipated gradually and become more confined to northern areas and Scotland. A band of cloud approached from the southwest, bringing heavy showers to southwest England and Northern Ireland at the end of the day.

## Daily Weather Summary for Sunday 30 April 2023

This day's summary created 07/05/2023 03:03

### Summary of the UK Weather for Sunday 30 April 2023

Sunday started dry for many, especially in central and southeastern England, with some clear breaks in the cloud. A trough resulted in some heavy rainfall over Northern Ireland throughout the night and into the morning, along with showers over northern England and western Scotland. A band of organised rainfall moved eastwards from the southwest and western Wales as the morning progressed. This was heavy in places. Some fog and low cloud developed from the west during the morning. Through the remainder of the day, the slow-moving band of rain continued on its eastwards trajectory, and began clearing eastern coasts by the early evening, persisting somewhat across northeast Scotland. This band was closely followed by scattered showers, locally heavy at times, particularly across Northern Ireland and northwest Scotland, where thundery showers required a yellow warning. The southeast remained mostly dry through the day, but saw some fading daytime showers later into the evening.

## Daily Weather Summary for Sunday 30 April 2023

## Daily Weather Summary for Sunday 30 April 2023

None of the selected stations observed a day of sleet or snow falling or non-zero snow depth at 0900 UTC.

## Guidance Notes

UTC = Universal Coordinated Time. For the UK UTC is the same as GMT (Greenwich Mean Time).

National boundaries shown on the European station map are for illustrative purposes only.

### Daily extremes

- Daily extremes have been manually confirmed by Met Office Observations Quality Management as valid observations from the live database at the time of checking. However, more extreme values may still be possible if they occur after the time of production.
- Mountain stations above 500 masl are excluded from lowest temperatures, highest gust speeds and greatest snow depths at 0900 UTC. This is because they are not considered representative of low level areas.
- Counties quoted against each station are based on historical county boundaries pre-1974 and may not reflect current administrative boundaries.

### Analysis charts and satellite imagery

- The satellite imagery is infra-red imagery from the geostationary MSG satellite.
- The rainfall image is derived from satellite data from MSG and rain-radar data. This represents a snapshot of instantaneous rain-rates at 0000 UTC and 1200 UTC and so does not necessarily reflect daily accumulations in the rainfall station map.
- Any analysis charts or satellite images which are unavailable will be displayed as white space.

### Station maps

- The UK maps show station data for the same set of stations presented UK data table. These stations are selected to provide good spatial coverage across the UK; they represent only a fraction of the overall UK observing network.
- Wind speed maps show wind speed in Kt and direction both averaged over the hour up to the time of observation. 1 Kt = 1.151 mph.

### Hourly station data

- The data tables provide spot hourly observations from synoptic messages at 0000 and 1200 UTC. Missing data are denoted by '-'.

- Pressures are mean sea level pressure in hPa.
- For UK stations, Gibraltar and Jersey, the wind speeds and directions are both averaged over the hour up to the time of observation. However, for European stations wind speeds and directions are both averaged over a 10-minute period up to the time of observation.
- Wind speeds are in Kt. Wind directions are stored in the database every 10 degrees and have been converted to the nearest point of the compass. These give the direction the wind is blowing from, not to.
- Cloud amounts are in Oktas from 0 (clear) to 8 (overcast). 9 indicates sky obscured (eg by fog).
- Air temperature and dew point temperature are in Celsius.

### **Temperature maps**

- Daily maximum, minimum and grass minimum temperatures are in Celsius.
- The period for the daily maximum temperature is defined from 0900 UTC on the day in question to 0900 UTC the following day.
- The period for the daily minimum and grass minimum temperatures is defined as 0900 UTC the previous day to 0900 UTC on the day in question.
- On any given day the minimum will typically occur in the early hours of the morning and the maximum in early afternoon.

### **Rainfall, sunshine and max gust speed maps**

- Daily rainfall is in mm from 0900 UTC on the day in question to 0900 UTC the following day.
- Daily sunshine is in hours from Kipp and Zonen CSD1 automatic sunshine records. Bright sunshine is defined as exceeding 120 W/m<sup>2</sup>.
- Max gust speeds are the daily max gust in Kt from 0000-0000 UTC

### **Snow maps**

- The day of snow falling map displays data from present weather sensors, showing stations which have recorded sleet or snow falling at any point in the day (0000-0000 UTC).
- The snow lying map shows level snow depth as recorded by the automatic snow depth sensors at 0900 UTC. These snow depth sensors do not record snow depth if this is less than 1cm.
- Snow depth sensors are normally operational from October to April, in the event of snow falling outside this period data availability may be limited.

- Snow maps will only be displayed if one or more of the selected stations on that date have recorded either snow falling or non-zero snow depths. If snow maps are not displayed it is still possible that other stations in the network have recorded a day of sleet or snow falling or non-zero snow depth.
