Daily Weather Summaries for February 2023

If you have any questions or feedback about this product or wish to obtain further data please contact the Met Office.

This document contains daily weather summaries for each day of February 2023. The Met Office National Meteorological Library and Archive holds a continuous record of daily weather summaries or daily weather reports from 1860, and these daily weather summaries form a continuation of that series.

The purpose of each summary is to provide an overview of the weather conditions across the UK on that day, with the historical emphasis mainly based on observations from surface network of weather stations, although the format has varied over the decades. While the emphasis remains on observations from the surface network, the current daily weather summaries supplement these by including satellite and rain-radar imagery to provide a more complete overview. The current format of the daily weather summaries is as follows:

1. Text summary of the main characteristics of the weather during the day, written by an operational meteorologist in the Met Office operations centre.
2. Table of daily extremes for the UK for key climate variables including temperature, rainfall, sunshine and gust speeds.
3. Overview of the synoptic situation at 00 and 12 UTC comprising: analysis charts showing the surface pressure pattern and associated weather fronts; North Atlantic and European infra-red satellite images showing cloud-cover; combined infra-red and rain-radar images of the UK; maps of wind speed and direction at 00 and 12 UTC; observations of pressure, wind speed and direction, cloud cover, air and dewpoint temperature at selected UK and European stations in data tables.
4. UK maps of key climate variables from observing stations including maximum, minimum and grass minimum temperature, rainfall, sunshine, gust speed and snow.
5. Further guidance notes

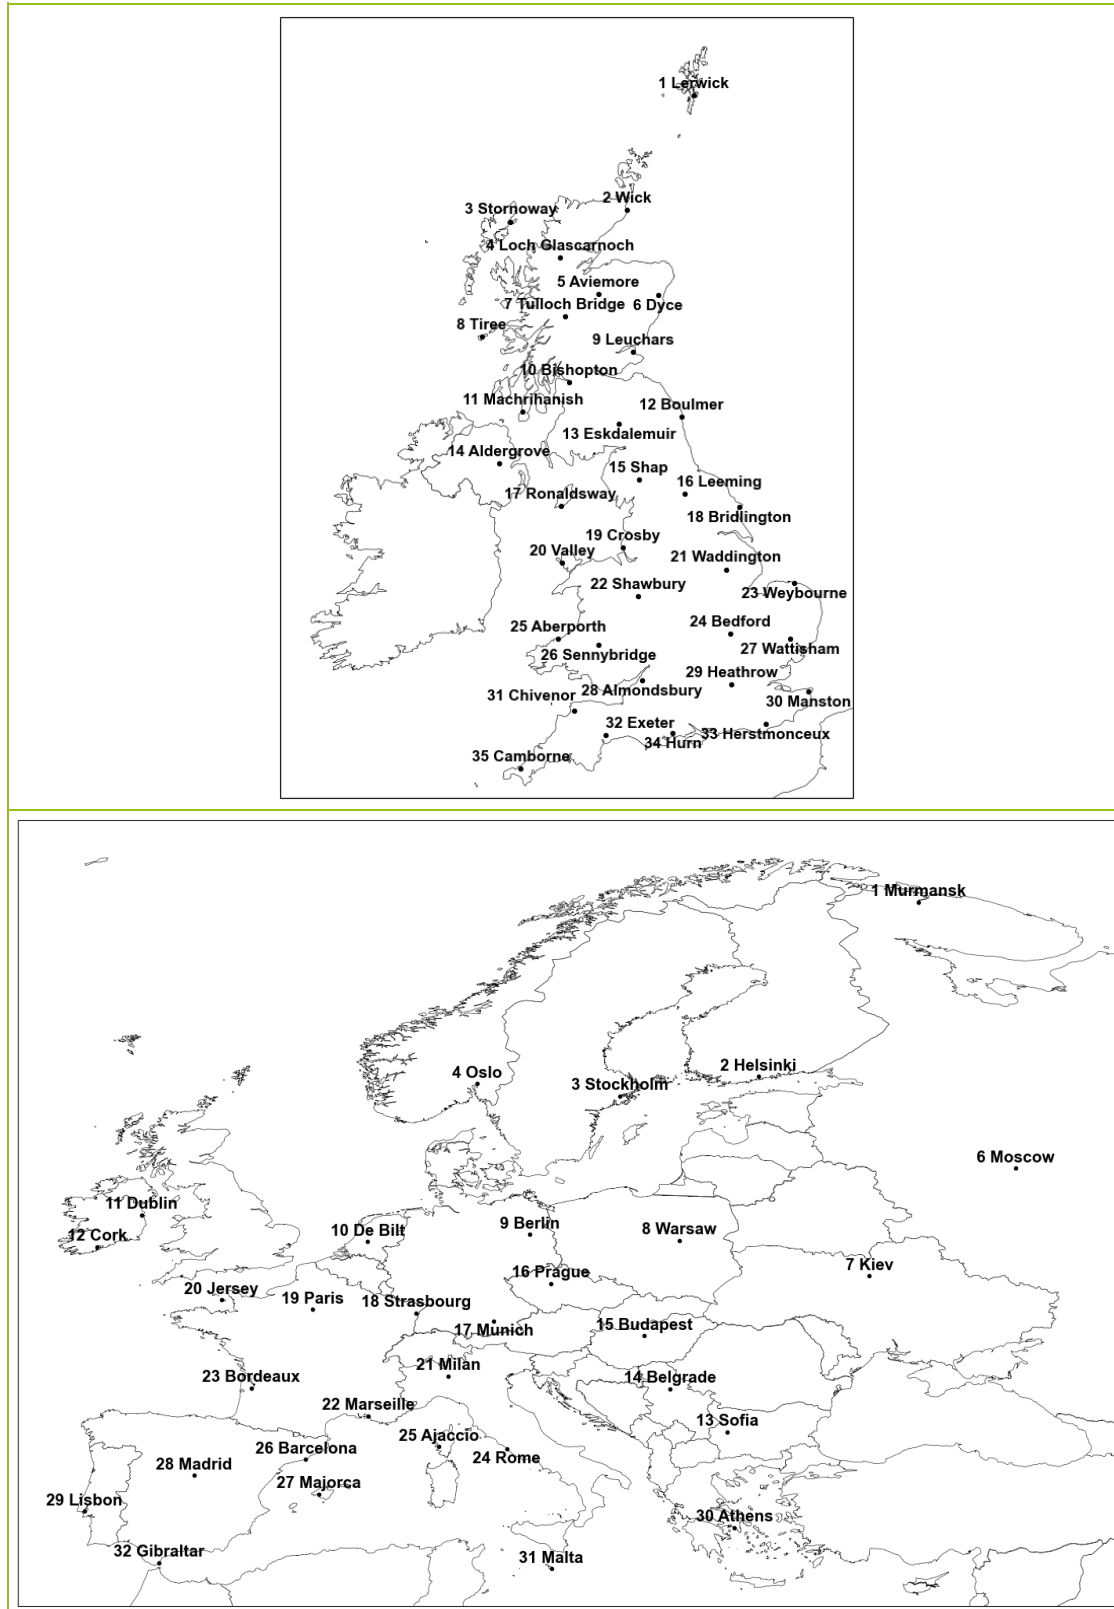

If you spot any data errors or omissions in this product please contact the Met Office.

Daily Weather Summary for Wednesday 01 February 2023

This day's summary created 08/02/2023 03:03

Summary of the UK Weather for Wednesday 01 February 2023

A low-pressure system to the north of the UK moved eastwards through the early morning. This was accompanied by very high wind speeds in northern Scotland, Orkney, and Shetland (up to 62 miles per hour recorded at Lerwick), for which a yellow warning had already been issued. Showers also affected Scotland, some heavy in places and some falling as snow over higher ground. These showers merged together to form a more cohesive band of rain, which began to sink southwards across the UK at 02:00. Further south it was a largely dry and calmer start. A deep low off of northern Scotland continued to bring showers to the far north of Scotland and rain to Northern Ireland and the northwest of England through the day. Elsewhere skies were cloudy. This progressed, bringing rain to southern Scotland later. Elsewhere, there were sunny spells with increasing cloud cover as the front progressed. Strong winds, gale force at times in the north. Strong gusts accompanied the showers. Temperatures were average to mild for the time of year.

Summary of the UK Weather for Thursday 02 February 2023

It was a cloudy start for most of the UK with only brief clear spells in Wales and southeastern parts of England. A warm front moving northeastwards brought rain into Scotland and northeastern England, and it stayed reasonably breezy here throughout the night. Hill fog and drizzle were recorded in some central parts of Wales such as Sennybridge in the early hours, though this was quick to clear. Rain persisted in the north as the warm front made progress through the morning. Beginning to somewhat clear into the afternoon, northwestern and western parts of Scotland continued to see outbreaks of rain throughout the day. Northern Ireland, Wales, and western parts of the UK saw generally drizzle and patchy rain throughout Thursday, and persistent cloud cover. The east and southeast continued seeing dry but cloudy conditions into the afternoon, though seeing some sunnier spells at times. Breezy conditions persisted across much of the UK, with significant gusts along coasts and across northern parts. This continued into the evening, with southeastern parts staying dry, and the north and west of Scotland seeing further outbreaks of rain, with some severe gales through the night.

Summary of the UK Weather for Friday 03 February 2023

The early hours brought patchy light rain and drizzle across northern and western parts of Scotland, Northern Ireland, south Wales, and the southwest. Meanwhile it remained dry and cloudier for eastern parts, with some clearer spells. Winds remained strong into Friday morning, with gusty conditions along northern and eastern coasts. Through the morning, showers and some longer spells of rain developed across northwestern Scotland, meanwhile light rain and drizzle continued across western parts of the UK. It remained dry for many eastern areas, though generally overcast and cloudy. The UK saw notably high pressures building for the time of year, allowing southern and eastern areas to hold onto these settled conditions, and see a mostly cool but bright and dry day. Rain across western parts generally cleared through the afternoon and into the evening, and breaks in the cloud formed over the east, allowing for some clearer spells to form overnight

Summary of the UK Weather for Saturday 04 February 2023

With high pressure remaining in charge, Saturday saw largely benign weather conditions across the UK. Patchy light rain affected most western parts through the early hours, whilst the rest of the UK saw a dry start with widespread frost forming under clearer spells. From late morning, showers or longer spells of rain affected northwestern Scotland. By the late afternoon, rain continued in most of Scotland and moved across northern England, due to a cold front moving south and eastwards. High-pressure affected the rest of the UK, as a result, cold, bright and dry conditions affected most of the nation.

Summary of the UK Weather for Sunday 05 February 2023

A region of exceptionally high pressure remained over the UK, with the pressure center located to the west of Wales. The remnants of a decaying cold front resulted in the odd patch of light rain across the south of the UK in the early morning, but these quickly stopped. It was a mainly clear night for the majority of the country, with some thicker cloud moving in from the northwest to Scotland during the morning. It was a dry day for all with the high pressure sat over the UK. Much of England and Wales had clear skies throughout the day. Further north, cloud started to build up especially over Scotland. Into the afternoon, high level cloud was visible over large parts of England. By 1600, some light rain made its way into western Scotland. The rest of the country remained clear and dry conditions continued into the evening leading to some very low overnight temperatures. Winds were light and variable.

Summary of the UK Weather for Monday 06 February 2023

A veil of high pressure laid over southern and central parts of the UK, centering over the southeast through the early hours. This brought predominantly clear, dry, and frosty conditions for much of England and Wales - with some patches of fog. In contrast, this system covered Northern Ireland and Scotland with a blanket of low cloud and outbreaks of drizzle, causing a north/south temperature split. From early morning and through the day, high pressure systems persisted across most of the country. As a result, cloud, dry and brighter conditions affected most of the UK. However, in the early evening around 17:00 UTC, showers and rain were seen in the northwest Scotland.

Daily Weather Summary for Tuesday 07 February 2023

This day's summary created 14/02/2023 03:03

Summary of the UK Weather for Tuesday 07 February 2023

A cold front moved into the far northwest of Scotland shortly after midnight, bringing cloud and outbreaks of rain. The feature travelled southeastwards across the northern and northwestern parts, reaching northern half of Scotland by dawn. Elsewhere, it was a mostly dry start. Frost and freezing fog patches developed across central and southern England through the small hours. The cold front continued tracking southeastwards throughout the day, reaching the north of England by midnight. This brought light to moderate rain to northeast Scotland and the upslopes of western Scotland through the morning, with some light outbreaks towards the north of England through the afternoon. There was a split in the cloud cover, with the northwest of the country seeing mostly cloudy conditions, whilst skies stayed clearer in the southeast. However, fog and freezing fog patches were slow to clear in the south of England and Wales, with some lingering into the early afternoon. This limited daytime temperatures in the south, whilst temperatures elsewhere were milder. Fog began forming again under clear skies in the south.

Daily Weather Summary for Wednesday 08 February 2023

This day's summary created 15/02/2023 03:03

Summary of the UK Weather for Wednesday 08 February 2023

It was a clear night across most parts of the country. Towards dawn, two cold fronts bringing a band of cloud entered northwest Scotland. Freezing fog patches started to develop around the country in the early hours, with significant parts of England, in particular the southeast, and southern Scotland covered. Throughout the day a high pressure system influenced most part of the UK, and once any fog patches cleared, most areas saw dry and fairly cold conditions with long periods of sunshine. The cold fronts continued to sink southwards, causing the associated cloud to spread over much of Scotland and northern England. This cloud was followed by wintry showers which affected the northwest Scotland in the late afternoon. These showers turned to snow over high ground, and coupled with the cold temperatures caused some surfaces to turn icy. By the evening the fronts, along with the precipitation had started to dissipate, and the air behind them had reached the northwest of Scotland, bringing clear skies with it.

Summary of the UK Weather for Thursday 09 February 2023

A cold front brought cloud and drizzle to northern areas at the start of the night, and moved southwards through the early hours, dissipating as it went and reaching the southeast by dawn. Behind it, there were clear skies, causing temperatures to drop below freezing, particularly across the south. Some showers did enter Scotland from the west before dawn, brought by a low pressure system to the northwest of the country. Winds were light except in the northwest where it was breezy. It continued to be a mostly dry and clear day for the majority of the UK. A weakening cold front moved southeastwards, producing some light precipitation and had cleared the far southeast by noon. There were also some patchy showers in northern and eastern Scotland, these falling as snow across high ground. It became cloudier into the evening and this continued into the night.

Summary of the UK Weather for Friday 10 February 2023

A warm front brought cloud from the northwest across Scotland and northern England through the early hours of the morning, with rain predominantly falling across western upslopes. Southern areas remained dry, with many patches of clear sky in southernmost areas leading to some cold and foggy conditions in the early morning, though patchy cloud across the southeast prevented temperatures dropping as low as previous nights. Largely dry conditions continued through the day, while some scattered showers continued for the northwest of England. Northern and Western Scotland were affected by some more organised rainfall, heavy in places, for much of the day. Cloud cleared slowly from the southeast through the morning, before returning by the later afternoon. Similar conditions persisted into the evening, with some fog developing under clear skies, especially in the southwest. Approaching midnight, northern Wales saw some light rainfall. Winds were generally light and westerly.

Summary of the UK Weather for Saturday 11 February 2023

From midnight high pressure systems influenced most parts of the UK. As a result, dry, clear and cold weather conditions affected most of the country. However, showers and rain were observed in some parts of southwestern and northern Scotland. Conditions remained similar through much of the day, with scattered showers continuing in places through the morning, although these had mostly decayed by 1200. There were some breaks in the cloud cover through the morning, with parts of the northeast seeing the most sunshine. Some more showers developed across parts of Scotland and Northern Ireland in the evening, extending to northern England at times. Winds were generally light and westerly, although winds were moderate for parts of Scotland at times.

Summary of the UK Weather for Sunday 12 February 2023

From midnight, high pressure systems were dominant. This resulted in a dry night for nearly the entirety of the UK, with only a few light showers making it inland along the west coast of Scotland, and the far southeast of England. It was a cloudy start to the day for most, with a few clear patches in the south for some. As the morning progressed the cloud started to clear from the west, due to the development of southerly winds. Further into the morning, light showers continued for northwestern Scotland, however the dry weather continued elsewhere. By the early afternoon, some breaks in the cloud had begun to form in western Wales and southwestern England, gradually extending eastwards through the afternoon. Clear skies continued to open up in the evening, extending to the Scottish Borders and northeast England by midnight. Some fog formed under clearer skies, especially in central Scotland and parts of Wales and the southwest. The southeast mostly remained under cloud cover throughout the day, with some light showers developing from around 2100, particularly in East Anglia.

Summary of the UK Weather for Monday 13 February 2023

It was a dry start to Monday for the vast majority of the UK, with some occasional light isolated showers forming over the west and north coast of Scotland, but not making it far in land. There was patchy cloud cover for most at midnight, but this cleared in the west through the morning. It was a calm night, with a light southeasterly breeze along the south coast of England. The day continued with most of the country covered with light cloud with some clear patches through the morning. This dissipated through the day giving a sunny afternoon for most. By evening, clear skies dominated with only patchy cloud in central Scotland and parts of northern England. Winds were generally light, but stronger in parts of the west and northwest. Temperatures were chilly in the morning, but warmed up to give double figures in places, and average to mild elsewhere. It cooled down under the clear skies.

Summary of the UK Weather for Tuesday 14 February 2023

It was a dry start across the country, with generally clear skies and some patchy freezing fog, especially for parts of southern and eastern England. From around 0130, some showers moved northeastwards across Northern Ireland, reaching parts of western Scotland by 0530. The arrival of this band of showers coincided with some cloud cover developing over parts of southwest England, which progressed northeastwards through the early morning. Low cloud and fog dominated over large parts of the UK in the morning. This cleared most southern parts by 1200. Northwestern parts of England and Scotland had thicker cloud throughout the morning, with a few scattered showers appearing by 1200. These showers became a bit heavier and move eastwards during the afternoon, although had dissipated by 1700. More southern areas remained clear and dry for the duration of the afternoon and into the evening. Patchy fog started to develop in eastern areas into the night.

This day's summary created 22/02/2023 03:04

Summary of the UK Weather for Wednesday 15 February 2023

The calm, cold and humid conditions over much of England led to widespread fog and freezing fog during much of the night. Frontal systems pushing into the northwest caused rain and high winds in the western isles and the northwest of Scotland. These fronts slowly progressed eastwards through the night. Winds were calm to light over most of the country, but stronger in the north with localised gale force gusts in the northwest. Temperatures were mostly chilly to freezing over much of the country. The cold front continued tracking southeastwards throughout the day, weakening through the afternoon. This brought moderate to heavy rain to much of Scotland, northern England, and Wales, with some lighter outbreaks across southern and eastern areas. Winds generally remained light throughout, though blustery along the front and across western upslopes. Behind the front, conditions remained cloudy, so any sunny spells were largely restricted to the southeast. However, fog patches were slow to clear across southern areas. Temperatures remained mild for most, and even warm in parts of the southeast.

Daily Weather Summary for Thursday 16 February 2023

This day's summary created 23/02/2023 03:03

Summary of the UK Weather for Thursday 16 February 2023

At midnight, a large band of cloud was spread across much of England and southern parts of Scotland. This was accompanied by showers or light rain in southwest England and the western edge of northern England. The rain spread eastwards during the early hours, becoming locally heavy in northern England between 0200 and 0300. The majority of the rain cleared the east coast by 0600 with only a few scattered showers remaining. In the early hours, a low pressure system off the northwest coast was named 'Storm Otto' and accompanied yellow warnings for strong wind across Scotland and NE England as of 0300 17/02/23. Today though, light showers continued through to midday, where a large band of rain made landfall on the west coast of Scotland, pushing southeastwards. This continued over the country through the rest of the day, covering much of Scotland and northern England with scattered showers and locally heavy rain. Elsewhere remained generally dry but cloudy, with some broken sunny spells. Winds were relatively calm through the day but picked up into the evening as Otto neared. Temperatures were mild for most, largely close to if not slightly above average.

This day's summary created 24/02/2023 03:03

Summary of the UK Weather for Friday 17 February 2023

A very wet windy night for the north of the UK, with widespread heavy rain for Scotland initially. This eased slightly through the early hours as it spread southeastwards, affecting northern England shortly after midnight. The strongest winds were in the far north of Scotland, with a gust of 70kts recorded at Lossiemouth. Elsewhere for much of England and Wales it was a dry night, with moderate westerly winds. From early morning throughout the day high pressure systems persisted across southern half of UK, which brought dry, cold and bright weather conditions across the south. However, from early morning to midday, rain and showers affected the northwest, west Scotland and central England. In early evening, rain and showers started again across northwest Scotland.

Summary of the UK Weather for Saturday 18 February 2023

At midnight, an occlusion progressed northeastwards across the country, bringing heavy precipitation to Scotland and northern England through the early hours. A north/south temperature split brought wintry conditions, sleet and hail in parts to the north, particularly the Scottish Highlands, and a mild start to the day for the south. Patchy drizzle was recorded in some southern areas, which quickly cleared into the morning a leaving cloudy, breezy dawn. Showery spells continued for parts of England and Wales through the day, gradually moving eastwards, while Scotland remained largely dry through the afternoon. Breaks in the cloud cover were most frequent along the eastern coast, although these had mostly closed over by the afternoon, leaving widespread cloudy conditions. Showers returned to eastern Scotland into the evening, along with some patchy fog across northern England and parts of Scotland.

This day's summary created 26/02/2023 03:03

Summary of the UK Weather for Sunday 19 February 2023

From midnight, high pressure systems covered most parts of the UK and, as a result cold, clear and dry conditions were observed in most places. At midnight, scattered rain and showers affected some parts of central England, although quickly cleared southeastwards. Through the early hours, rain and showers began across southern and northern Scotland, some wintry at times over high ground. The dry conditions continued for much of England and Wales, although scattered showers remained across parts of Northern Ireland. Heavier rainfall continued for northwest Scotland through the morning, spreading gradually eastwards. Breaks in the cloud cover developed through the day across eastern and southern parts, resulting in mild conditions for much of England. Winds were particularly strong for northwest Scotland. Rain continued across Scotland into the evening, with further showers developing in Wales and northwest England by midnight. Clear conditions remained through much of the evening across central and southern England.

Summary of the UK Weather for Monday 20 February 2023

From midnight heavy rain affected northwest Scotland, with just some patchy light rain and drizzle over northern England and Northern Ireland. Elsewhere there was low cloud and mist patches in southern England whilst in the east stronger winds generally cleared any mist. By dawn the heaviest rain had eased, but it remained drizzly for many northern areas. The weather was dominated by a high pressure area to the south of the country with a low pressure area centred to the northwest of Scotland progressing eastwards through the day. Cloudy conditions were prevalent with scattered clear spells and occasional light rain. North Scotland initially experience strong to gale force winds, which abated through the day. Temperatures were mild, especially in the north.

This day's summary created 28/02/2023 03:03

Summary of the UK Weather for Tuesday 21 February 2023

Much of the country saw a dry start, although a band of rain and showers lingered over parts of Scotland as a warm front progressed northeastwards through the morning. Clear conditions were prevalent across much of Wales and central England, although some patchy cloud remained, especially for coastal areas, northeast of England and most of Northern Ireland. Through the early hours, scattered showers continued to track eastwards across Scotland, before some heavier rainfall reached the Western Isles just before dawn. A low pressure area in the North Atlantic brought a warm sector over the UK. This brought damp and cloudy conditions to most of the country. Eastern areas started bright but clouded over. The cold front at the back end of the sector brought rain and showers to western Scotland from the early afternoon, extending to Northern Ireland and northwest England by the end of the day. Towards midnight, showers became more widespread, developing across southern England and parts of Wales. Winds were generally light, but stronger under the influence of the cold front.

Summary of the UK Weather for Wednesday 22 February 2023

Rain and showers lingered over most of the west through the early hours, gradually spreading eastwards towards dawn as a cold front and a series of troughs passed through. Clear patches were present in the southeast early in the morning, but these became less prevalent as the frontal system progressed. Parts of the far southeast remained dry through the morning. Winds were mostly light northwesterlies. A cold front with a band of cloud and showers moved eastwards across the country through the morning. Cloud was dominant across the east of the country throughout the morning, whilst further west, the cloud started to break up from 0900. Into the afternoon, there were scattered showers across northern parts of England and Wales. Showers moved southwards from northern Scotland throughout the afternoon. Into the evening, cloud was dominant across most of the country with a few scattered showers.

Summary of the UK Weather for Thursday 23 February 2023

Heavy showers affected the southwest shortly after midnight, but they cleared quickly south. Moderate patchy rain affected much of northern England, with this making incursion into the southwest in the early hours. Apart from the Kent coast, the southeast stayed mostly dry, as did Scotland and Northern Ireland. Winds were moderate northerlies in the south, more light and variable further north. At 0700, the morning started with showers across the south west of England, and mostly dry conditions elsewhere. This rain had mostly cleared by 1000, leaving a large band of cloud over southern England and clearer skies further north. From 1000 a band of cloud and rain entered northern Scotland which got progressively heavier into the afternoon. The divide between cloudy conditions in the south and clearer skies in the north continued throughout the afternoon. The rain in Scotland gradually moved southwards easing into the evening and overnight. The band of cloud moved progressively southwards into the night, leaving cloudy skies over the north and much clearer conditions in the south.

Summary of the UK Weather for Friday 24 February 2023

It was a clear and frosty night in the far south of the UK, whilst a patchy bandy of rain gradually moved southwards over Scotland. Occasional showers moved in from the north sea to east coasts, but these didn't make much progress inland. Winds were moderate in the north and east, but light elsewhere. From early morning, rain and showers over Scotland continued southwards through the rest of the day, with further scattered showers in some parts of central and southeast England. Cloudy and dry conditions persisted elsewhere. By the end of the day, showers also affected some parts of the southwest while cloudy, dry conditions were observed elsewhere.

Summary of the UK Weather for Saturday 25 February 2023

Showers continued approaching from the north in the early hours, through to the morning, affecting eastern coasts and across the north of Scotland. Some of these penetrated further inland in the East Midlands, however, these were predominantly light. Elsewhere, dry conditions remained, though clear spells and light winds allowed patches of frost to form in a few places. Widespread cloud cover continued through the day, although there were a few clear patches across Wales and in the southeast. Patchy showers along eastern coasts continued to move southwestwards, although these had mostly dissipated before reaching central England. Similar conditions continued into the evening, although cloud cleared across central and southern England, allowing some patchy frost to develop towards midnight. Winds were generally light to moderate northeasterlies. It was an unseasonably mild day, with above average maximum temperatures for all four home nations.

Summary of the UK Weather for Sunday 26 February 2023

*Sunday began dry and generally cloudy for many as high pressure remained over Scotland. Clearer spells were observed over western coasts, allowing frost to form particularly in Scotland where winds were lighter. Scattered showers were present through the early hours and affected the length of the east coast, pushing inland but dissipating quickly. Some fell wintry over Scottish ground. Wind were brisk and moderate towards the south. Scotland and parts of Northern Ireland remained largely clear through the day, although parts of south and eastern Scotland saw some more persistent cloud cover. As the day progressed, some breaks in the cloud developed over southern England and Wales. The far southeast saw sporadic showers throughout the day, which were wintry in places, while the northeast also saw some showers, which remained through the day. Approaching midnight, conditions remained largely similar, although showers in the northeast began making slow progress across northern England.

Summary of the UK Weather for Monday 27 February 2023

High pressure has established over Scotland in recent days, bringing a widely settled start to the week. Much of Scotland, the southwest and parts of Northern Ireland were clear, allowing overnight frosts to form, particularly over the Scottish Highlands. Central and southeastern parts saw cloud and scattered light showers through the hours, progressing inland on a brisk northeasterly breeze. Aurora Borealis was notably active and visible overnight, with plenty of sightings as far south as Cornwall. Conditions remained mostly dry through the day, with widespread cloud across much of Wales, Northern Ireland and northern England. Northwest Scotland saw the clearest conditions, while far southern England also saw some sunny spells, these becoming less frequent as the day progressed. There were some showers along the east coast through the day, with some making it as far inland as the Pennines. Gloucestershire also had the odd slight shower in the morning. By the evening, breaks in the cloud cover had developed over southeast England, these extending westwards towards midnight.

Summary of the UK Weather for Tuesday 28 February 2023

Widespread cloud cover persisted through the early hours, with some scattered showers pushing westwards across central England, northern England and Wales. Northwest Scotland saw the clearest conditions, along with parts of southern England. Approaching dawn, a narrow, concentrated band of showers, resulting from a convergence line in the English Channel, made landfall in eastern Kent. Winds were generally light northeasterlies, although these strengthened slightly through the morning. From the early morning high pressure has dominated most parts of the country, which brought dry and bright conditions, with sunny spells observed in most of the UK. However, cloudy conditions, with isolated showers and drizzle affected some of western Scotland and some parts of north, central and southwest England.

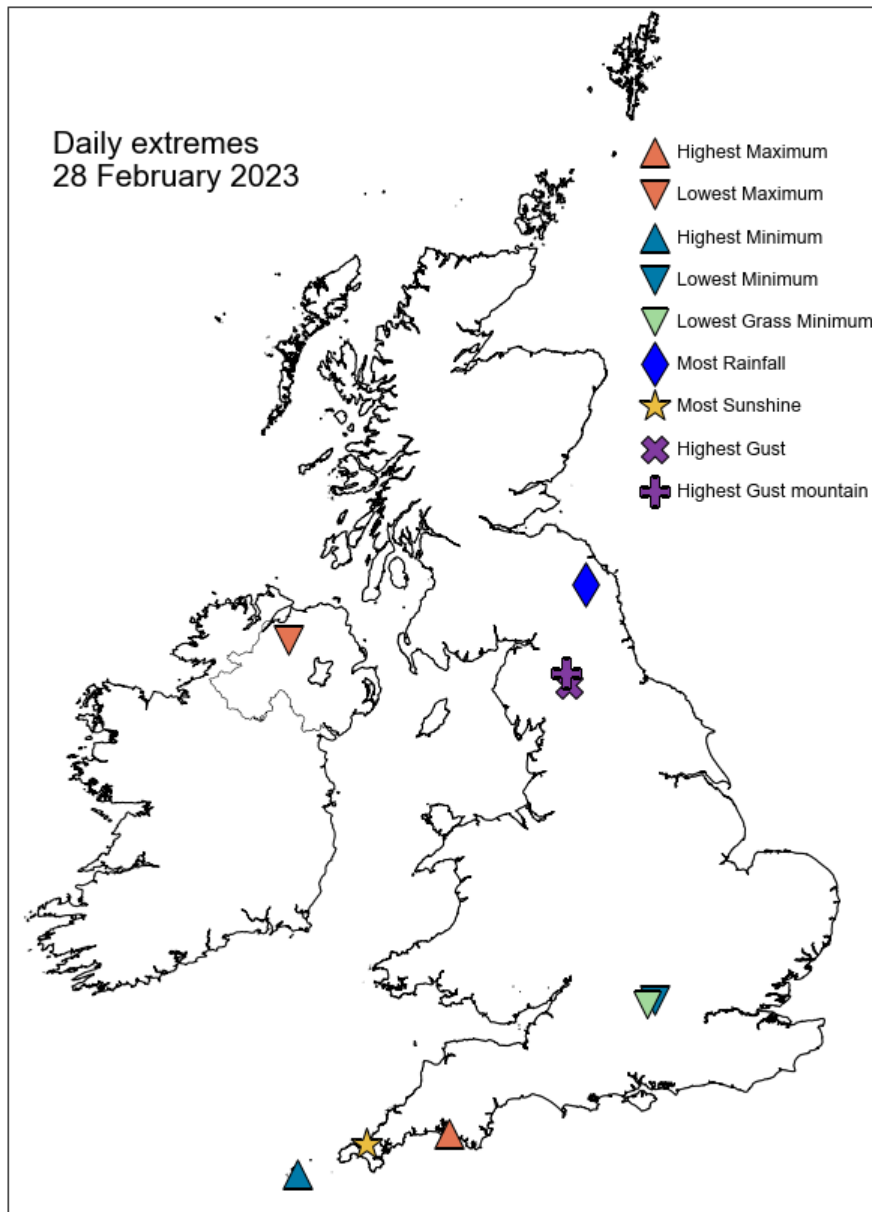

Daily Extremes

<i>Highest Maximum</i>	10.1°C Plymouth, Mountbatten (Devon, 50mAMSL)
<i>Lowest Maximum</i>	4.5°C Banagher, Caugh Hill (Londonderry, 214mAMSL)
<i>Highest Minimum</i>	5.7°C Scilly: St Marys Airport (Isles Of Scilly, 31mAMSL)
<i>Lowest Minimum</i>	-5.0°C Benson (Oxfordshire, 57mAMSL)
<i>Lowest Grass Minimum</i>	-9.9°C Benson (Oxfordshire, 57mAMSL)
<i>Most Rainfall</i>	12.0mm Goldsclough (Northumberland, 305mAMSL)
<i>Most Sunshine</i>	8.8hr Camborne (Cornwall, 87mAMSL)
<i>Highest Gust</i>	38Kt 44mph Warcop Range (Cumbria, 227mAMSL)
<i>Highest Gust (mountain*)</i>	57Kt 66mph Great Dun Fell No 2 (Cumbria, 847mAMSL)
<i>Greatest Snow Depth at 0900 UTC</i>	No non-zero values.

mAMSL refers to station elevation in metres above mean sea level.

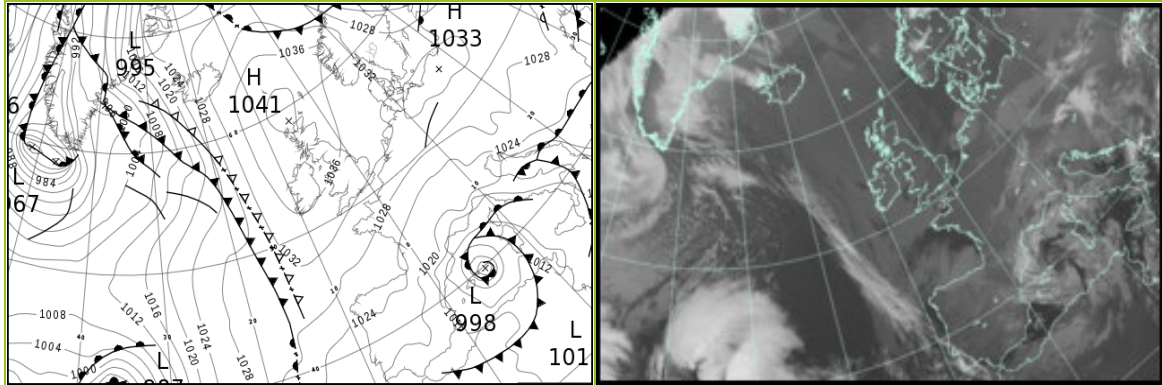

*Mountain stations are above 500mAMSL.

Daily Weather Summary for Tuesday 28 February 2023

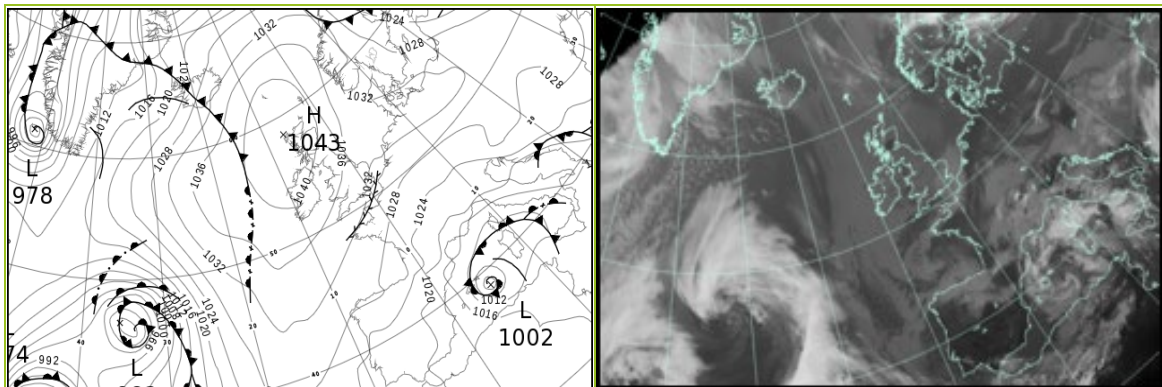

Daily Weather Summary for Tuesday 28 February 2023

None of the selected stations observed a day of sleet or snow falling or non-zero snow depth at 0900 UTC.

Guidance Notes

UTC = Universal Coordinated Time. For the UK UTC is the same as GMT (Greenwich Mean Time).

National boundaries shown on the European station map are for illustrative purposes only.

Daily extremes

- Daily extremes have been manually confirmed by Met Office Observations Quality Management as valid observations from the live database at the time of checking. However, more extreme values may still be possible if they occur after the time of production.
- Mountain stations above 500 masl are excluded from lowest temperatures, highest gust speeds and greatest snow depths at 0900 UTC. This is because they are not considered representative of low level areas.
- Counties quoted against each station are based on historical county boundaries pre-1974 and may not reflect current administrative boundaries.

Analysis charts and satellite imagery

- The satellite imagery is infra-red imagery from the geostationary MSG satellite.
- The rainfall image is derived from satellite data from MSG and rain-radar data. This represents a snapshot of instantaneous rain-rates at 0000 UTC and 1200 UTC and so does not necessarily reflect daily accumulations in the rainfall station map.
- Any analysis charts or satellite images which are unavailable will be displayed as white space.

Station maps

- The UK maps show station data for the same set of stations presented UK data table. These stations are selected to provide good spatial coverage across the UK; they represent only a fraction of the overall UK observing network.
- Wind speed maps show wind speed in Kt and direction both averaged over the hour up to the time of observation. 1 Kt = 1.151 mph.

Hourly station data

- The data tables provide spot hourly observations from synoptic messages at 0000 and 1200 UTC. Missing data are denoted by '-'.

- Pressures are mean sea level pressure in hPa.
- For UK stations, Gibraltar and Jersey, the wind speeds and directions are both averaged over the hour up to the time of observation. However, for European stations wind speeds and directions are both averaged over a 10-minute period up to the time of observation.
- Wind speeds are in Kt. Wind directions are stored in the database every 10 degrees and have been converted to the nearest point of the compass. These give the direction the wind is blowing from, not to.
- Cloud amounts are in Oktas from 0 (clear) to 8 (overcast). 9 indicates sky obscured (eg by fog).
- Air temperature and dew point temperature are in Celsius.

Temperature maps

- Daily maximum, minimum and grass minimum temperatures are in Celsius.
- The period for the daily maximum temperature is defined from 0900 UTC on the day in question to 0900 UTC the following day.
- The period for the daily minimum and grass minimum temperatures is defined as 0900 UTC the previous day to 0900 UTC on the day in question.
- On any given day the minimum will typically occur in the early hours of the morning and the maximum in early afternoon.

Rainfall, sunshine and max gust speed maps

- Daily rainfall is in mm from 0900 UTC on the day in question to 0900 UTC the following day.
- Daily sunshine is in hours from Kipp and Zonen CSD1 automatic sunshine records. Bright sunshine is defined as exceeding 120 W/m².
- Max gust speeds are the daily max gust in Kt from 0000-0000 UTC

Snow maps

- The day of snow falling map displays data from present weather sensors, showing stations which have recorded sleet or snow falling at any point in the day (0000-0000 UTC).
- The snow lying map shows level snow depth as recorded by the automatic snow depth sensors at 0900 UTC. These snow depth sensors do not record snow depth if this is less than 1cm.
- Snow depth sensors are normally operational from October to April, in the event of snow falling outside this period data availability may be limited.

- Snow maps will only be displayed if one or more of the selected stations on that date have recorded either snow falling or non-zero snow depths. If snow maps are not displayed it is still possible that other stations in the network have recorded a day of sleet or snow falling or non-zero snow depth.
