## Daily Weather Summaries for May 2023

**If you have any questions or feedback about this product or wish to obtain further data please contact the Met Office.**

This document contains daily weather summaries for each day of May 2023. The Met Office National Meteorological Library and Archive holds a continuous record of daily weather summaries or daily weather reports from 1860, and these daily weather summaries form a continuation of that series.

The purpose of each summary is to provide an overview of the weather conditions across the UK on that day, with the historical emphasis mainly based on observations from surface network of weather stations, although the format has varied over the decades. While the emphasis remains on observations from the surface network, the current daily weather summaries supplement these by including satellite and rain-radar imagery to provide a more complete overview. The current format of the daily weather summaries is as follows:

1. Text summary of the main characteristics of the weather during the day, written by an operational meteorologist in the Met Office operations centre.
2. Table of daily extremes for the UK for key climate variables including temperature, rainfall, sunshine and gust speeds.
3. Overview of the synoptic situation at 00 and 12 UTC comprising: analysis charts showing the surface pressure pattern and associated weather fronts; North Atlantic and European infra-red satellite images showing cloud-cover; combined infra-red and rain-radar images of the UK; maps of wind speed and direction at 00 and 12 UTC; observations of pressure, wind speed and direction, cloud cover, air and dewpoint temperature at selected UK and European stations in data tables.
4. UK maps of key climate variables from observing stations including maximum, minimum and grass minimum temperature, rainfall, sunshine, gust speed and snow.
5. Further guidance notes

If you spot any data errors or omissions in this product please contact the Met Office.

## Daily Weather Summary for Monday 01 May 2023

This day's summary created 16/05/2023 15:41

### Summary of the UK Weather for Monday 01 May 2023

At first, large parts of the country were covered in cloud but showers were confined to northwest England, eastern coasts and parts of the southeast. These showers were slow to clear, especially in the east. Clear spells started to develop from 0300 in northeast and southern England. Elsewhere, it was largely dry. After a cloudy morning, skies cleared to sunny spells for much of the day in the southwest. Elsewhere, occasional patches of rain or drizzle broke out for northern Scotland and much of England and Wales. Some of these showers turned heavier in the afternoon in eastern England, with occasional thunder. Cloud continued to clear to the east through the afternoon giving a fine and dry second half of the day to all but the far east of England and Scotland. Into the evening most showers cleared but there were some outbreaks of light rain and drizzle across southern Scotland and Northern England.

### Summary of the UK Weather for Tuesday 02 May 2023

It was a cloudy start, with much of the country experiencing dry conditions. However, eastern coasts saw some isolated showers early in the morning, along with parts of northern Scotland and central Northern Ireland. Winds were primarily light easterlies, although the Western Isles saw some slightly stronger winds. Overcast skies of low cloud persisted predominantly across central and the southeast of England as the morning progressed. Any fog and mist gradually burned back, and a decaying cold front swept southwards across the UK. Winds veered to a light southeasterly flow in the afternoon and any low cloud slowly lifted. Patchy showers affected Northern Ireland for a time in the early evening.

### Summary of the UK Weather for Wednesday 03 May 2023

It was a benign night for much of the UK, with almost all areas remaining dry. Rain slowly pushed in from the Atlantic to Northern Ireland, reaching the west coast of Scotland shortly after dawn. Low cloud lifted and broke up in England and Wales to leave clear skies at times. Winds were light throughout. It was a generally dry, bright start to the day with hazy sunshine, but heavier cloud to the north. Rain moved into the highlands in the late morning becoming more widespread across Scotland by the late afternoon, but clearing all except the northern isles by midnight. Winds were initially light, becoming stronger through the day, especially in the southwest where gusts reached gale force. The cold morning heated up quickly, especially in the west where temperatures reached the high teens by mid-afternoon. It was cooler in the east with an easterly breeze.

### Summary of the UK Weather for Thursday 04 May 2023

Into the early hours of the morning, rain persisted in the far north of Scotland as the two warm frontal systems drifted eastwards. This warm airmass brought generally mild overnight temperatures. At the surface, winds remained easterly, sometimes southeasterly, and broken low cloud spread across mainland UK. Cloud cover became more widespread and overcast as the night progressed. Around dawn, mist and fog reduced the visibility in parts of northern Scotland and the far southwest. The morning started dull for most, brighter in the far east. A low pressure moved in from the Atlantic bring rain and showers to the southwest. This spread northwestwards through the day. The cloud to the east and north cleared to give most a dry, bright day. The fronts cleared the southwest of England and Wales by midnight. The strong winds in the southwest eased during the morning to leave most with light to moderate winds. The easterly breeze kept temperatures down in eastern areas. It was milder elsewhere.

### Summary of the UK Weather for Friday 05 May 2023

The night was mild across the UK. These brought moist airmass to the UK overnight and a few bands of rain arrived in the southwest and Wales. The frontal system in the early morning, with lightning detected in the English channel at the eastern end of the fronts. Scattered showers persisted in Northern Ireland throughout. Widespread cloud covered the whole of the UK in the morning with heavy showers in southwest, northeast and northern England. These become more widespread through the morning, becoming locally heavy and thundery, with spherics in eastern areas. Scotland remained dry for much of the morning except some rain on eastern coasts. These showery conditions, locally very heavy, continued through much of the afternoon with spherics becoming more widespread in the southeast and then spreading most of the country later on. By late afternoon, the showers had cleared southern areas of the country. Into the evening, the showers moved northeastwards largely dissipating by the end of the day leaving only a few very scattered showers in northern England and some light rain in Scotland.

### Summary of the UK Weather for Saturday 06 May 2023

From the midnight to early morning, a deep low-pressure center has been occurring in the southwestern area to the UK, which brought mild moisture air towards UK. As a result, showers and rain affected across southwestern England and few places of northern England, locally heavy in the southwest. Dry and partly cloudy conditions dominated elsewhere. A band of thick rain moved eastwards across the southeast through the morning, this heavy in places. This cleared to the far southeast through the evening, resulting in dry and clearer skies here. Cloudy for most with localised showers in the north, these with hail and thunder in places.

This day's summary created 16/05/2023 15:31

### Summary of the UK Weather for Sunday 07 May 2023

By midnight, some unsettled conditions remained particularly along the eastern coasts and southern Scotland, with scattered showers slowly tracking northeastwards. Cloudy skies elsewhere gave a dull start to the day for many, with patchy fog across the midlands, but these began to clear through the early hours, particularly in central and southern England. Through the morning, skies continued to clear for across most of England to leave mostly clear and funny spells for many. Much of the Scottish rain cleared the coast but persisting cloud brought drizzly outbreaks from the west. This trend continued until the early evening, before a frontal system brought an organised band of rain, heavy and thundery at times, in from the west, reaching Northern Ireland by 1900L. This is set to continue towards mainland overnight into Monday.

This day's summary created 16/05/2023 15:29

### Summary of the UK Weather for Monday 08 May 2023

Monday started with an east/west split, with a frontal system approaching from the Atlantic moving eastwards. This resulted in a dry and clear start to the day in the east, cloud in central England, and a thick band of rain in the west. This band of rain was persistent and continued to move eastwards through the night. By dawn the rain had cleared northern Ireland, but still covered the southwest, west and north of England and Scotland. The band of rain continued its eastwards track through the morning, covering much of England and Scotland by 0900, and parts of the southeast by midday. Behind this, there were some cloud breaks and sunny spells between local showers, the heaviest of which across Northern Ireland, where very localised, heavy thunderstorms justified a yellow warning. A second, heavier band of rain followed from the Atlantic over Cornwall during the early afternoon. This moved eastwards through into the evening, reaching central and eastern parts overnight.

### Summary of the UK Weather for Tuesday 09 May 2023

At midnight a band of moderate rain with some heavier bursts lay across eastern England. This moved gradually east through the early hours, clearing the Norfolk coast around 0500. Heavy showers affected the far east of Scotland but quickly cleared after midnight, whilst some sporadic rainfall lingered for a time over northern England. Elsewhere, outbreaks of rain in the early hours for central Scotland and north Wales persisted through dawn. Whilst much of central and western England remained dry, patches of mist and fog were widely reported, whereas skies remained clear for Northern Ireland. A westerly flow brought low cloud to the southwest to begin, as showers developed along the west coast and Northern Ireland. The first thunderstorms were reported mid-morning in the southwest as a band of convective showers, caused by sea breeze convergence, pushed northeastwards. By noon these had spread to much of Wales, as the low cloud and fog lifted elsewhere. Widespread thunderstorms and overcast skies then swept across central and southern England throughout the afternoon. Showers were persistent in northern parts of Scotland.

### Summary of the UK Weather for Thursday 11 May 2023

It was an overcast start for many, with scattered showers in place for central Wales, parts of the South West, and Northern Ireland. Western Scotland in particular saw heavy and persistent rainfall. These showers developed through the early hours, also affecting eastern coasts. Some fog also developed for northeastern Scotland in the early hours. By dawn, central northern England experienced some slow moving showers, stretching from the Scottish Borders to the Midlands. In the far south east, there were some clear spells. A low pressure system moved southeastwards increasing the frequency of showers and unsettled weather in Northern Ireland, central and the southwestern England. Convergence zones formed in the southwest and east Anglia fuelling convective cloud formation. The first lightning strikes were observed mid-morning in London, and became widespread throughout central and eastern England, and also Wales throughout the afternoon. A chilly onshore flow brought low stratus and mist to parts of northern Scotland throughout.

### Summary of the UK Weather for Friday 12 May 2023

A ridge of high pressure brought a fine night with clear skies or light cloud for many. Showers in eastern England and west Wales faded quickly. Skies became widely clear across central England in the early hours and some patches of fog formed. Rain and showers moved into the southeast by dawn. Winds were generally light from the north/northeast throughout the night. It was a mild night for most, except for northeastern Scotland where temperatures dropped to low single figures. From early morning throughout the day, high pressure persisted for most, which brought dry, warm and bright weather conditions across the UK. However, cloudy condition, with some isolated showers affected in southern and southeastern areas.

### Summary of the UK Weather for Saturday 13 May 2023

A ridge straddled the country giving a dry night for most with clear periods in the north/northeast of Scotland and west Wales. Elsewhere it was cloudy with scattered clear spells and some patchy fog. Isolated showers skirted the south coast of England. A band of rain arrived in northwest Scotland by the morning. Winds were initially light across the country but strengthened in the south later. Temperatures held up in the low teens in the south, but it was a chilly night for the rest of the country. The ridge of high pressure remained throughout the day. This resulted in a dry day for the nation. Fine and bright for many, with cloud in the south east. A cold front off the coast of Scotland to the northwest brought thicker cloud across Scotland into the evening.

This day's summary created 21/05/2023 03:03

### Summary of the UK Weather for Sunday 14 May 2023

From midnight to early morning, relatively settled conditions persisted across most parts of the UK. As a result, dry and clear conditions dominated most parts of the country. However, moderate rain affected Northern Ireland and most parts of Scotland, locally heavy in western Scotland. The day started with cloud in the northwest and over northern Ireland and Scotland as a result of a cold front which moved southeastwards through the day. As a result there was also a band of rain which moved and decayed through the day. The southeast and south was initially dry and bright, but cloud built into the afternoon and evening, with rain over Wales and the southeast in places by the evening.

### Summary of the UK Weather for Monday 15 May 2023

From midnight to early morning, high-pressure, with settled conditions dominated most parts of the UK, which brought dry and relatively cold weather conditions across northern, central and southwestern England, Northern Ireland and Wales. However, isolated showers affected northwestern Scotland and southeastern England. A cold front cleared the UK from the southeast by morning bringing cooler temperatures as high pressure continued to build from the west. Patchy showers persisted in northern Scotland and Northern Ireland throughout the morning, as low cloud developed in the east of England. A dry and bright day for most with any low cloud lifting with daytime heating, and some convective clouds forming along eastern coasts.

### Summary of the UK Weather for Tuesday 16 May 2023

Tuesday started with high pressure dominating much of the UK. This resulted in a dry and clear night for many. Cloud initially in Scotland and the southeast, but cleared in the southeast through the night. Scattered showers increased in intensity and frequency along the western and northern coast of Scotland as the night progressed. During the morning, these showers continued, with some cloud spreading from northwest England and north Wales into the Midlands. Light northwesterly winds for much of the country. There were sunny spells towards the South and Wales, however some cloud bubbled up around midday, with one cloudy region moving southwards from central and eastern areas towards the southeast. The showers in Scotland spread to eastern and southern parts of Scotland and into northern England during the day. During the evening, most cloud melted away in the south however more cloud remained further north. The showers across the north of the UK mostly died out, with a few lingering in the northeast of England. Winds were generally light to moderate from the northwest, strongest near windward coasts.

### Summary of the UK Weather for Wednesday 17 May 2023

Overnight the high pressure system remained to the west of the UK bringing widespread settled weather. A cool arctic maritime airmass dominated northern Scotland, where a few showers remained overnight in the far north. Into the early hours, low cloud developed in northern England and parts of Scotland. Remaining dry for most however, with light southwesterly winds. Through the morning, more organised rain progress towards northern parts of Scotland, reaching land by midday. This continued southeastwards though the afternoon, heavy at times, covering much of Scotland by late afternoon. Elsewhere remained dry, with scattered cloud and some sunny breaks inbetween. Scottish rain eased into the evening and overnight, leaving low cloud and drizzle for most. It remained cloudy to the south, keeping temperatures up slightly from recent nights.

### Summary of the UK Weather for Thursday 18 May 2023

Overnight, the rain over Scotland gradually moved south east, weakening as it went so that it was only giving patchy light outbreaks by the time it reached the far north of England towards dawn. Heavier showery outbreaks continued in Western Scotland, however. Cloud spread across much of England and Wales overnight, although parts of Southeast England started the morning clearer. This resulted in a milder night than previous nights for many, with the lowest temperatures where clear spells persisted. Winds were generally light away from the far northwest of Scotland. Skies partially cloudy from 6am this morning within the south of the country, especially in coastal areas. Generally cloudy for northern and central England throughout the day. Medium to high level clouds were a consistent feature for most of the UK as the day evolved, with some clearer spells for western Scotland and Northern Ireland, and some sunshine in the south of England. Sporadic rainfall affected western Scotland and Northern Ireland throughout the day, with some drier spells mid-morning, before the rain cleared by late afternoon. There were also outbreaks of light rain and drizzle for central and northern England in the afternoon. Into the evening there continued to be sporadic outbreaks of rain and drizzle across central and northern areas, but it remained dry further south. Wind were light and variable for many, turning southwesterly in Scotland and central England and southeasterly in the south of the UK.

### Summary of the UK Weather for Friday 19 May 2023

Overnight, a cold front passed through the north of UK, bringing outbreaks of rain, heaviest along the east coast. As the light band of rain moved southeastwards, it brought further drizzle towards the east and south of England and northern Scotland. Elsewhere, it was generally cloudy and dry overnight, with occasional clearer spells towards the southwest. From early morning, high pressure persisted across central and northern parts of UK, which brought dry, warm and bright weather conditions to central and northern England, Scotland, Northern Ireland and Wales. However, cloudy conditions with some isolated showers and rain affected southern, southeastern and some parts of southwestern areas, particularly heavy thundery showers affected towards midday.

This day's summary created 27/05/2023 03:02

### Summary of the UK Weather for Saturday 20 May 2023

At midnight, a ridge of high pressure covered much of the UK, keeping conditions fairly settled with a light breeze overnight. Two warm fronts lay over the northwest, bringing rain and drizzle across Scotland. This system moved southeastwards during the early hours, bringing cloudy conditions to the north and northwest, drizzly in any thicker cloud. Elsewhere remained dry and mostly clear, with plenty of sunny spells as the sun rose. As the day progressed, the warm front continued to move in a south-eastwardly direction across Scotland and Northern Ireland, bringing cloud and patchy rain over the region. The southern half of the UK saw largely dry and sunny conditions, with scattered cloud towards the south, particularly later in the afternoon.

### Summary of the UK Weather for Sunday 21 May 2023

Unsettled conditions from midnight to early morning, with a warm and cold front that moved southeast towards eastern UK, producing moderate showers and patchy rain across Northern Ireland, northern England, and southwestern Scotland. Showers and rain gradually decreased from Northern Ireland, southwestern Scotland and northern England in the early morning. Elsewhere, dry, clear and relatively cold weather conditions persisted. During the day, mostly cloudy conditions and a few showery outbreaks of rain associated with the weakening fronts continued to affect Scotland and Northern Ireland. England and Wales were generally sunny, but with some cloud affecting the far northwest and north Wales, reducing in extent through the day, while the southeast, and later southern counties, saw areas of cloud bubbling up and spreading out.

### Summary of the UK Weather for Monday 22 May 2023

Predominantly clear and dry conditions to start the week across much of the UK. A decaying cold front across southern Scotland brought patchy rain and cloud. A chilly night in areas where cloud was absent. Generally clear and dry conditions for the majority of the UK. The cold front in the north of UK moved southeasterly as the day went on. It brought patches of showers affecting the far north of Scotland in the morning and throughout the day for south of Scotland. A trough shifting west in the eastern coast caused a few showers in eastern England. Occasional showers over the Pennines throughout the day as well.

### Summary of the UK Weather for Tuesday 23 May 2023

Most of the country had clear skies, or light cloud overnight. The cloud was thicker in northern Scotland, with some rain in the west early in the period giving a bright start to the morning. This cleared and the cloud thinned for most. Rain moved into Northern Ireland, western Scotland and parts of the Lake District towards dawn. Winds were light. Temperatures were mild - in the low to mid-teens - for most, but cooler in the north and some rural areas under clear skies. Through the morning and into the afternoon much of the UK experienced fine and predominately dry weather. A band of high cloud associated with a southerly migrating cold front pushed across the UK through the day, with sunny spells persisting locally. Some light rain and showers affected Scotland and into the border regions through the day, dying out through the afternoon with the rest of the UK remaining dry.

### Summary of the UK Weather for Wednesday 24 May 2023

Many areas had clear skies, although with some patchy high level cloud in the south and over Scotland, along with some lower level cloud moving into western Scotland and Northern Ireland. Winds were generally light away from the north of Scotland where they were more moderate. The clear skies led to a locally chilly night, although many areas remained in mid-high single figures. A warm and fine day for most in the UK, although high level cloud associated with a weak cold front effected Scotland and the border regions through the day pushing into areas of northern England through the late morning, dissipating as it moved southward. Winds were light through the day with the effects of a sea breeze experienced at coastal locations. Temperatures were warm right across the UK, even in areas impacted by cloud through the day.

### Summary of the UK Weather for Thursday 25 May 2023

The weather across the UK overnight was mostly clear and dry. There were some patches of cloud that passed by the UK, mostly over the central areas and west to southwest of Scotland. These clouds were mostly associated with a decaying cold front travelling south from Scotland. Temperature was the lowest where skies were clear. High pressure continued to dominate across the UK throughout the day, leading to dry conditions for most. High patchy cloud moved into areas of eastern and northern England and parts of Northern Ireland over the morning, before spreading southeast across southern Wales and southeast England over the afternoon, became patchier in these areas. The thickest cloud remained over northeast England, where there were scattered showers in the afternoon. Winds generally remained light, except in the far north of Scotland where coastal areas saw some moderate breezes. Temperatures were lowest in northern parts of Scotland, but in general were above average across the UK.

### Summary of the UK Weather for Friday 26 May 2023

From midnight to early morning, high-pressure, with settled conditions dominated across most parts of the country. As a result, dry, clear and relatively cold weather conditions affected most of the UK, though some variable low cloud persisted across northern and central parts of UK. High pressure was predominant during the day. Clear and warm weather conditions persisted in most of the UK. Dry for the majority with the development of showers in the far northwest of Scotland during the morning. Cloud built up during the morning over Scotland from the northwest as well as some thinner cloud over the Pennines and Northern Ireland. North-easterly winds affected south and central England, resulting in a decrease in temperature from the average in coastal zones.

### Summary of the UK Weather for Saturday 27 May 2023

A largely clear and dry night for most of the UK with some high level cloud pushing southward through the home counties to the southern coast by the early hours. A low pressure system situated to the northwest of Scotland brought some light patchy rain to the far north of Scotland from the outset which increased in intensity and area in the early hours. Cloud cover increased right across Scotland into early morning but elsewhere was dry and clear with light winds throughout resulting in a chilly night for localized areas. In the morning, a depression moved northeasterly to the north of Scotland with a weakening cold front progressing southeasterly across Scotland; correspondingly, most of Scotland started cloudy with patchy rain and drizzle. The rest of the country was clear with odd patches of cloud which burnt off during the day to give a clear dry evening to all but some coastal areas. Winds were light in the south, but stronger to the northwest, especially in the Western Isles. It was initially chilly, but temperatures rose quickly in the sunshine.

## Daily Weather Summary for Sunday 28 May 2023

This day's summary created 04/06/2023 03:03

### Summary of the UK Weather for Sunday 28 May 2023

A decaying cold front moved southward across southern Scotland and Northern Ireland into central England over the night, generating patchy cloud cover over these regions and a few showers in the far north of Scotland shortly after midnight. Elsewhere, the night was generally clear and dry with light winds throughout. The clear conditions led to a chilly night for areas without cloud cover, particularly in northern Scotland behind the front but also in the southeast of England. The cold front travelling south across the UK has brought some very isolated showers in eastern Scotland as well as the east coast of England, also brought along some clouds that travelled down south along the front. The weather remained predominantly clear and sunny over the day in the North with Scotland and central to South and southwest of England being slightly cloudier. Temperature was relatively warm.

### Summary of the UK Weather for Monday 29 May 2023

High pressure to the west of Scotland was still in charge, giving a clear and dry night for most. A fading cold front progressed down the North Sea bringing some cloud to parts of southern England. A warm front approached the Northern Isles bringing thicker cloud and some rain/drizzle. Wind was generally light initially but strengthened in the southwest towards dawn. It was chilly night under the clear skies. Warmer in the south where temperatures kept up in the low teens. It was a chilly start in some places, with cloud lingering along eastern coasts and across central England and Wales. By midday, much of this cloud had burned off leaving a fine day with long spells of sunshine across the country. A warm front to the north of the country pushed southwards in the afternoon, bringing some thicker cloud to Orkney, Shetland and the far northern coast of Scotland. Elsewhere skies remained mostly clear in to the evening, with some high cloud turning sunshine hazy in southern Wales, central England and East Anglia.

### Summary of the UK Weather for Tuesday 30 May 2023

High pressure continued to dominate with weak fronts skirting around the UK to the north. The night was dry and clear for most with local, patchy cloud. The day dawned with a bright clear start for western and southern areas, with cloud across northeastern Scotland, eastern and central England, and eastern Wales. The wind was generally light, but moderate in the south. It was chilly under the clear skies but warmed up quickly after sunrise. During the day, the extent of cloud-cover reduced somewhat, although eastern and central areas of England remained mostly cloudy. Other areas (except the extreme NE of Scotland and the Northern Isles) were sunny. There was a considerable east-west split in temperatures defined by the cloud-cover and northeasterly breeze. Eastern and some central areas of England remained in the low to mid-teens, with the breeze being strongest towards the southeast. Meanwhile, western areas including Northern Ireland and Central Scotland were warm, locally very warm. During the evening, cloud edged back westwards across central-southern England.

### Summary of the UK Weather for Wednesday 31 May 2023

A large high pressure centred to the northwest of the country dominated the weather across the UK. From midnight and through the early hours cloud pushed back in from the northeast of the UK leaving a dry but cloudy night for all. This cloud was patchy in places giving some localised clear spots in western locations but remained steadfast for the majority. Winds were light in a northeasterly direction right across the night with some breezier conditions in eastern coastal locations. Cloud cover allowed temperatures to remain rather mild. From early morning throughout the day, high pressure, with settled conditions dominated across most parts of the UK. Cloud burnt back towards the east with southern and western areas including most of Scotland and Northern Ireland becoming mostly clear, however eastern areas along with central England into east Wales remained mostly cloudy. During the evening, cloud started to thicken and spread westwards again, with western and southern coastal areas remaining clear.

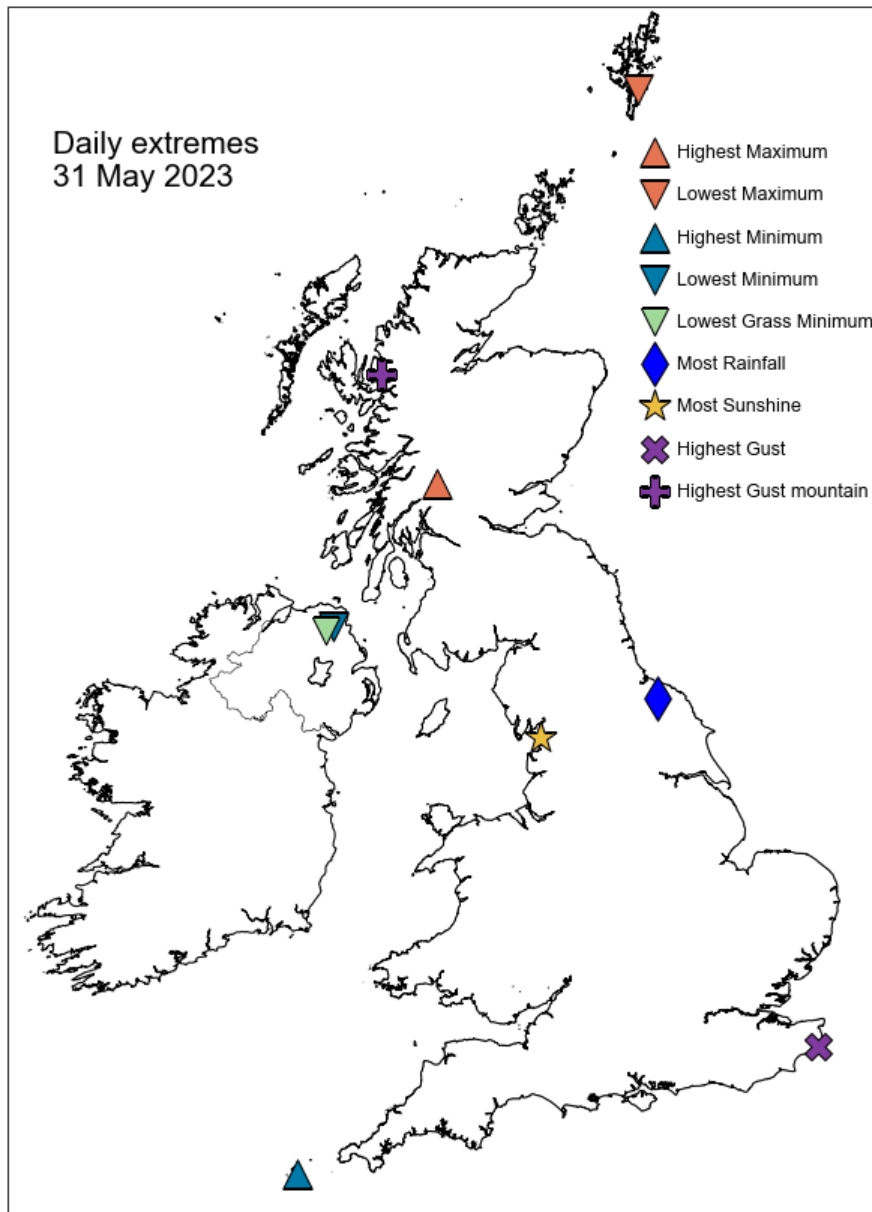

### Daily Extremes

<i>Highest Maximum</i>	<b>24.8°C</b> Tyndrum No 3 (Perthshire (in Central Region), 168mAMSL)
<i>Lowest Maximum</i>	<b>10.9°C</b> Lerwick (Shetland, 82mAMSL)
<i>Highest Minimum</i>	<b>12.7°C</b> Scilly: St Marys Airport (Isles Of Scilly, 31mAMSL)
<i>Lowest Minimum</i>	<b>2.2°C</b> Altnahinch Filters (Antrim, 213mAMSL)
<i>Lowest Grass Minimum</i>	<b>-2.6°C</b> Altnahinch Filters (Antrim, 213mAMSL)
<i>Most Rainfall</i>	<b>1.0mm</b> Westerdale (North Yorkshire, 228mAMSL)
<i>Most Sunshine</i>	<b>15.3hr</b> Morecambe No 2 (Lancashire, 7mAMSL)
<i>Highest Gust</i>	<b>34Kt 39mph</b> Langdon Bay (Kent, 117mAMSL)
<i>Highest Gust (mountain*)</i>	<b>20Kt 23mph</b> Bealach Na Ba No 2 (Ross & Cromarty, 773mAMSL)
<i>Greatest Snow Depth at 0900 UTC</i>	No non-zero values.

mAMSL refers to station elevation in metres above mean sea level.

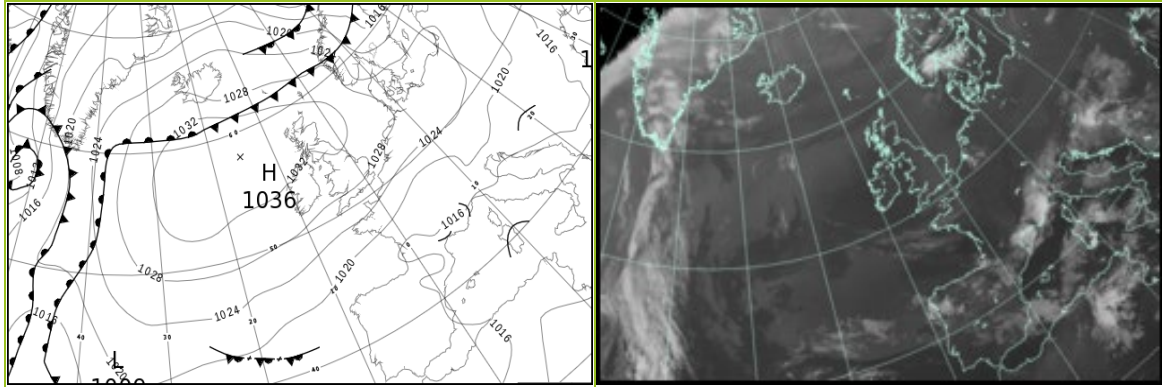

\*Mountain stations are above 500mAMSL.

Daily Weather Summary for Wednesday 31 May 2023

## Daily Weather Summary for Wednesday 31 May 2023

None of the selected stations observed a day of sleet or snow falling or non-zero snow depth at 0900 UTC.

## Guidance Notes

UTC = Universal Coordinated Time. For the UK UTC is the same as GMT (Greenwich Mean Time).

National boundaries shown on the European station map are for illustrative purposes only.

### Daily extremes

- Daily extremes have been manually confirmed by Met Office Observations Quality Management as valid observations from the live database at the time of checking. However, more extreme values may still be possible if they occur after the time of production.
- Mountain stations above 500 masl are excluded from lowest temperatures, highest gust speeds and greatest snow depths at 0900 UTC. This is because they are not considered representative of low level areas.
- Counties quoted against each station are based on historical county boundaries pre-1974 and may not reflect current administrative boundaries.

### Analysis charts and satellite imagery

- The satellite imagery is infra-red imagery from the geostationary MSG satellite.
- The rainfall image is derived from satellite data from MSG and rain-radar data. This represents a snapshot of instantaneous rain-rates at 0000 UTC and 1200 UTC and so does not necessarily reflect daily accumulations in the rainfall station map.
- Any analysis charts or satellite images which are unavailable will be displayed as white space.

### Station maps

- The UK maps show station data for the same set of stations presented UK data table. These stations are selected to provide good spatial coverage across the UK; they represent only a fraction of the overall UK observing network.
- Wind speed maps show wind speed in Kt and direction both averaged over the hour up to the time of observation. 1 Kt = 1.151 mph.

### Hourly station data

- The data tables provide spot hourly observations from synoptic messages at 0000 and 1200 UTC. Missing data are denoted by '-'.

- Pressures are mean sea level pressure in hPa.
- For UK stations, Gibraltar and Jersey, the wind speeds and directions are both averaged over the hour up to the time of observation. However, for European stations wind speeds and directions are both averaged over a 10-minute period up to the time of observation.
- Wind speeds are in Kt. Wind directions are stored in the database every 10 degrees and have been converted to the nearest point of the compass. These give the direction the wind is blowing from, not to.
- Cloud amounts are in Oktas from 0 (clear) to 8 (overcast). 9 indicates sky obscured (eg by fog).
- Air temperature and dew point temperature are in Celsius.

### **Temperature maps**

- Daily maximum, minimum and grass minimum temperatures are in Celsius.
- The period for the daily maximum temperature is defined from 0900 UTC on the day in question to 0900 UTC the following day.
- The period for the daily minimum and grass minimum temperatures is defined as 0900 UTC the previous day to 0900 UTC on the day in question.
- On any given day the minimum will typically occur in the early hours of the morning and the maximum in early afternoon.

### **Rainfall, sunshine and max gust speed maps**

- Daily rainfall is in mm from 0900 UTC on the day in question to 0900 UTC the following day.
- Daily sunshine is in hours from Kipp and Zonen CSD1 automatic sunshine records. Bright sunshine is defined as exceeding 120 W/m<sup>2</sup>.
- Max gust speeds are the daily max gust in Kt from 0000-0000 UTC

### **Snow maps**

- The day of snow falling map displays data from present weather sensors, showing stations which have recorded sleet or snow falling at any point in the day (0000-0000 UTC).
- The snow lying map shows level snow depth as recorded by the automatic snow depth sensors at 0900 UTC. These snow depth sensors do not record snow depth if this is less than 1cm.
- Snow depth sensors are normally operational from October to April, in the event of snow falling outside this period data availability may be limited.

- Snow maps will only be displayed if one or more of the selected stations on that date have recorded either snow falling or non-zero snow depths. If snow maps are not displayed it is still possible that other stations in the network have recorded a day of sleet or snow falling or non-zero snow depth.
