Daily Weather Summaries for May 2020

If you have any questions or feedback about this product or wish to obtain further data please contact the Met Office.

This document contains daily weather summaries for each day of May 2020. The Met Office National Meteorological Library and Archive holds a continuous record of daily weather summaries or daily weather reports from 1860, and these daily weather summaries form a continuation of that series.

The purpose of each summary is to provide an overview of the weather conditions across the UK on that day, with the historical emphasis mainly based on observations from surface network of weather stations, although the format has varied over the decades. While the emphasis remains on observations from the surface network, the current daily weather summaries supplement these by including satellite and rain-radar imagery to provide a more complete overview. The current format of the daily weather summaries is as follows:

1. Text summary of the main characteristics of the weather during the day, written by an operational meteorologist in the Met Office operations centre.
2. Table of daily extremes for the UK for key climate variables including temperature, rainfall, sunshine and gust speeds.
3. Overview of the synoptic situation at 00 and 12 UTC comprising: analysis charts showing the surface pressure pattern and associated weather fronts; North Atlantic and European infra-red satellite images showing cloud-cover; combined infra-red and rain-radar images of the UK; maps of wind speed and direction at 00 and 12 UTC; observations of pressure, wind speed and direction, cloud cover, air and dewpoint temperature at selected UK and European stations in data tables.
4. UK maps of key climate variables from observing stations including maximum, minimum and grass minimum temperature, rainfall, sunshine, gust speed and snow.
5. Further guidance notes

If you spot any data errors or omissions in this product please contact the Met Office.

Daily Weather Summary for Friday 01 May 2020

This day's summary created 12/05/2020 11:27

Summary of the UK Weather for Friday 01 May 2020

A mostly cloudy night as showers, which were heavy at times, continued to move eastwards across England and Wales. The north of England remained rather dry, whilst the western areas of Northern Ireland and Scotland saw the occasional shower throughout. It was a mild night for most, but some clearer spells did develop and allowed for a touch of frost in places towards the north of the UK and patches of fog to form in the early hours. Throughout the day, most places saw a mixture of sunshine and blustery showers, some turning heavy with hail. Despite seeing the best of the dry weather through the morning, northern England and Scotland saw frequent showers arrive during the afternoon, merging to longer spells of rain at times. Southeast England also saw showers turn thundery towards evening. It was generally a windy day, especially in and around the showers.

Summary of the UK Weather for Saturday 02 May 2020

A mostly dry night across the UK. Earlier in the night, there were scattered showers and light outbreaks of rain across northwest Scotland, Northern Ireland, Wales, northeast and southwest England. These began to clear all areas but Scotland into the early hours. Skies remained mostly clear in southern areas leading to a touch of frost in some rural areas. Cloudier skies across Scotland and northern England. Winds remained light throughout. The majority of the UK saw a good deal of dry weather throughout Saturday with bright or sunny spells as well as light winds. The best of the sunshine was in southwest and southeast England, where skies remained clear for much of the day. A few showers drifted across Scotland and into northern England through the afternoon. Towards evening, cloud started to build into southwest England as a band of rain approached.

Summary of the UK Weather for Sunday 03 May 2020

Another clear night for most with a few outbreaks of rain and showers in places. Through the night, rain pushed eastwards across the southwest of England and southern Wales. By dawn the rain had reached parts of the southeast, as well as continuing across the southwest and southern Wales. There were also a few light showers over eastern Scotland through the night. Towards dawn, there were some mist and fog patches across western Scotland, as well as a touch of frost in rural spots. Through the morning it was somewhat dry in the north with drizzle in the south and parts of Wales, however this swapped in the afternoon seeing the drier weather in the south and showers in the north. It did however, stay rather cloudy in the south and Wales. The heaviest and most persistent showers were in Scotland. Mostly calm winds throughout the UK.

Summary of the UK Weather for Monday 04 May 2020

Most of the UK remained dry overnight with some clear spells. Outbreaks of rain lingered across southwest Scotland and northeast England for much of the night, but these started to clear towards dawn. Across the south, it remained largely cloudy, with a few patches of rain at times. It was generally mild here, but it turned chilly further north where skies cleared. Patchy cloud dominated the UK in the morning, with showers lingering in the northeast and Scotland, but clearing for the most part in the afternoon. The cloud began to clear later on, however thick cloud began to push into the southwest from the channel. There was the odd shower in the midlands and east of England, however the rest of the UK was dry with sunny spells before sunset. Winds were generally light.

Summary of the UK Weather for Tuesday 05 May 2020

It was a dry night across the majority of the UK with the best of the clear spells across northern England, Scotland and Northern Ireland. Here, it turned cold with a touch of frost forming in rural spots. Through the early hours, cloud and rain, heavy at times, started to build into southwest England. It continued to spread eastwards towards dawn. Heavy rain at first across the southwest gradually turned patchier and slowly eased through the day. Elsewhere it was mainly dry with sunny spells.

Summary of the UK Weather for Thursday 07 May 2020

Overnight was largely dry, apart from the odd shower that reached the far west of the southwest, and a few showers that drifted onto the west coast of Wales. Winds were light, allowing the odd patch of mist or frost to form in some rural, isolated spots. After patches of mist and haze cleared in the early morning, the rest of the day saw plenty of sunshine and warmth. It remained mostly dry, although there were some heavy and occasionally thundery showers through the afternoon as a trough moved northeastwards across the UK. By the evening, the showers had cleared England and Wales, with some lingering in Northern Ireland and Scotland. The maximum temperature recorded was 23.1 Celsius in Heathrow, Great London.

Summary of the UK Weather for Saturday 09 May 2020

Overnight it was a largely dry night with clear spells. However, there were a few showers across Northern Ireland, northern Scotland and East Anglia at times. Chilly across northern parts. A dry and bright start across all southern areas, while further north it was cloudier with rain in the far north of Scotland. The rain continued across northern Scotland, spreading southwards later in the afternoon. There were also a few showers, thundery at times, across Wales. Elsewhere remained sunny and very warm. During the evening, rain pushed into northeastern England, while Wales and central parts of England saw some heavy, thundery outbursts of rain.

Daily Weather Summary for Sunday 10 May 2020

This day's summary created 17/05/2020 03:00

Summary of the UK Weather for Sunday 10 May 2020

It was another warm and dry night for much of the south of the UK. The exception to this was over parts of Lincolnshire, which saw some quite heavy falls of rain through the early hours. Across the far north of England, a marked change was occurring. A cold front was producing patchy rain, which was gradually spreading southwards, introducing much colder air behind. The air was cold enough for rain showers to begin to fall as a wintry mix across the far north of Scotland. Through the morning, there was rain across the east midlands, as well as the rain from the cold front continuing to push southeastwards into the afternoon. Further rain pushed up from the south, into the southern coastlines. Scotland saw scattered showers through the afternoon. It was very windy and there were also some coastal gales. As the cold front pushed southwards, the temperatures behind it fell considerably. However, it was still warm in the south ahead of the cold front.

Summary of the UK Weather for Monday 11 May 2020

A cooler night than of late, with a prevailing northeasterly. A windy night but largely dry, apart from some scattered showers that drifted into the northeast from the coast. Clear spells and patchy cloud throughout. Rural parts saw a pretty harsh frost for the time of year. It was a cold feeling day throughout the UK, especially for southern parts in a strong northeasterly breeze. There was very little precipitation to speak of, though a few showers were affecting the far north of Scotland. A large swathe of cloud was covering many central parts, but it was broken enough to allow plenty of sunny spells. Temperatures struggled, only managing to reach mid-teens in a few locations in the southwest. Plenty of crisp sunshine remained on offer during the evening, though a few showers bubbled up on the Kent coastline, quickly dispersing by midnight.

Summary of the UK Weather for Tuesday 12 May 2020

It was a clear and dry night across the majority of the UK, with the exception of a few outbreaks of rain across Scotland and Northern Ireland. Winds remained light. Temperatures fell under clear skies, leading to patchy frost in places. The southern half of the UK saw a fine and sunny morning, but there was still a notable chill in the air compared with the previous week. Further north across parts of northwest England and Northern Ireland, a few heavy showers formed, but quickly faded away. Cloudy skies over northern parts of the UK progressed south through the afternoon, though the sun was still able to break through sporadically. Over Scotland, a cold front was bringing some heavy rain for some, gradually sinking south during the evening, but losing intensity as it passed into England. Temperatures were again on the cool side compared with recent weeks.

Summary of the UK Weather for Wednesday 13 May 2020

It was a mostly dry and chilly night across the UK, with a good deal of clear spells, especially in the south where a patchy frost was able to develop. A band of cloud and showery rain progressed across northern England overnight, becoming patchier and lighter as it moved south. It reached parts of north Wales through the early hours, but fizzled out thereafter. After a frosty start for some, most places saw a dry morning with sunny spells, though a few showers pushed into parts of eastern Scotland and northeast England. Through the afternoon, cloud started to build across central and southern England as well as Wales, with clearer skies further north. Towards evening, the cloud began to break, allowing for sunny spells across many parts.

Summary of the UK Weather for Thursday 14 May 2020

Most of the UK saw a dry night with clear spells with much of the cloud fizzling out through the evening. This allowed for a patchy frost to develop in prone spots. A few showers lingered across eastern England overnight, though these began to ease towards dawn. Northwest Scotland also saw some showers, these mainly confined to the coasts. Through the morning, most parts saw a good deal of sunny spells, though northern Scotland continued to see cloudy skies and showers, a few of these turning heavy. Cloud started to push into eastern areas of the UK during the afternoon, with the best of the sunshine further west. Towards the evening, much of the cloud had become confined to northern England and Scotland with clear and sunny skies across the south.

Summary of the UK Weather for Friday 15 May 2020

It was again a dry night throughout the UK, the exception this being a few showers for the far north of Scotland. Clear spells for much of the southern half of the UK allowed temperatures to approach zero and frost to form in rural locations. It was a clear start to the day for many, particularly for southern parts of the country. There was cloudier skies in the north but still some bright spells breaking through. Throughout the afternoon the north remained cloudy with a few sunny spells and outbreaks of rain, which was heavy in places, accompanied by strong winds. In the south it was dry with a little high cloud for some but still plenty of sunshine on offer, Wales however saw thicker cloud building up in the afternoon. It was a warm day for many, particularly in the far south of the UK and where there were long periods of sunshine. The evening saw little change with showers and cloudy skies in the north but dry weather and patchy cloud in the south with long clear periods.

Summary of the UK Weather for Saturday 16 May 2020

It was mostly dry overnight with some clear spells, the best of these in the south. Cloud began to thicken from the west through the early hours, but it remained dry. The only places to see some rain were the far north of Scotland and the Shetland Islands. Here, the rain turned heavy, persisting for much of the night. Patchy rain continued in the north through the morning with heavy downpours in places and some drier and bright spells at times. The south saw thicker cloud develop for some in the morning but still some sunny spells. Although largely dry there were a few showers in central England. Rain eased in the north during the afternoon with sunny spells breaking out but a thicker band of cloud lingering across northern England. The south remained dry with thicker cloud breaking up and plenty of sunshine on offer, especially for the southwest. For the evening much of the UK saw dry conditions with variable cloud and clear spells. However, a band of heavy rain moved across Northern Ireland with some outbreaks of rain elsewhere in the north.

Summary of the UK Weather for Sunday 17 May 2020

Most places started the night dry with a mix of cloud and clear spells. Northern Ireland saw the arrival of a band of cloud and rain, heavy at times, which gradually pushed into parts of northern England and further north into Scotland. Through the early hours, the rain largely became confined to Scotland, spreading across most parts towards dawn, though some outbreaks of rain reached northeast England. Further south, it remained dry with cloud building across central England and Wales. A rather cloudy start across the country. With showery rain across Scotland, creeping into the north of England at times too, but dry elsewhere. Although it stayed cloudy in the north of England, sunny spells became longer through the afternoon in the south, midlands and Wales. Showers cleared through the afternoon, before a band of rain reached Northern Ireland in the early evening and then spread through Scotland and northern England later.

Summary of the UK Weather for Monday 18 May 2020

Overnight there was rain across the north of the UK with some heavy downpours at times and strong winds in places. The rain extended to some parts of northern Wales and central England also however the south remained dry and besides the odd clear spell was cloudy, as was the rest of the country. The rain eased for some away from the far north towards dawn. It was largely sunny across the south of England, the midlands and Wales, with elsewhere seeing cloudy skies. Showery rain moved inland from the west through morning across Scotland, the northwest and parts of Scotland. Through the afternoon cloud crept south, leaving only the south with sunshine, and some sunny spells in Scotland and the north. Cloud continued to spread further south again through the evening, leaving some sunny spells. Although gusty at times on higher ground in Wales and Scotland, there was a light breeze for most.

Summary of the UK Weather for Tuesday 19 May 2020

Overnight, there were plenty of outbreaks of rain scattered across the UK, particularly across western Scotland, northwest England and East Anglia. Towards dawn, these became heavy across western Scotland and died out elsewhere. By morning all the rain had cleared eastwards into the North Sea, leaving a warm and sunny day. The south of England saw the best of the warm weather and clearer skies, while further north there was some patchy cloud which continued to build into the afternoon. At times through the afternoon, the southwest of Scotland saw some light outbreaks of rain. The evening also remained clear in the south but cloudier in the north.

Summary of the UK Weather for Wednesday 20 May 2020

Overnight it remained largely dry with light to calm winds allowing patchy fog to form in some places across England and Wales. Across Scotland, it was also clear and dry barring some outbreaks of rain across the north, which pushed eastwards through the night. During the day, it was dry, sunny and very warm across much of the UK, particularly across the southeast of England. It was cloudier across Scotland and Northern Ireland but there were still some sunny spells and hazy sunshine, especially into the afternoon as the cloud began to thin. Staying dry through the evening across the UK, with further cloud building over Northern Ireland and Scotland.

Summary of the UK Weather for Thursday 21 May 2020

Overnight it started clear with light winds. In the small hours of Thursday a band of cloud reached the west coast of England and Wales followed by rain, which was heavy at times. Some thunderstorms were recorded, largely along the coast of South Wales. By dawn the rain had passed the southwest, Northern Ireland and Wales, and began pushing into the West Midlands and the northwest of the UK. Winds remained light and the rain left sunny spells in it's wake to start the day. By late morning the majority of the residual cloud and rain had clear England and Wales, with a few thunderstorms observed along the east coast of England, which persisted out into the North Sea. The rain and cloud had mostly cleared Scotland by the afternoon, with the rest of the UK basking in spells of sunshine. A further band of rain and cloud approached from the west during the early evening, bringing heavy rain to the edges of Wales, Northern Ireland and southwest England.

Summary of the UK Weather for Friday 22 May 2020

After a mostly dry evening, a band of locally heavy rain moved eastwards across the UK overnight. Winds strengthened through the early hours. Clearer spells developed across Northern Ireland and western Scotland with the rain clearing England and Wales towards dawn. The centre of the depression continued to move northeastwards along the coast of western Scotland, bringing prolonged and heavy rain to much of Scotland and Northern Ireland through the morning and into the evening. The rest of the UK started mainly dry with spells of sunshine developing in the afternoon, especially towards the east. A few showers continued throughout the day over Wales and northwest England.

Summary of the UK Weather for Saturday 23 May 2020

Overnight saw a band of heavy rain move in from the west across Scotland and Northern Ireland, accompanied by strong, at times gale force, winds. Elsewhere there were some heavy outbreaks of rain in the west but many areas staying dry with some clear periods. Eastern and southern parts of England stayed dry. Although cloudy for a time in the far south it became clear towards dawn. The rain continued across Scotland and Northern Ireland through most of the day. The heaviest bursts were confined to eastern Scotland to start, then western Scotland later on. Some of this rain spread southwards into northern England where parts of the Lake District saw some heavier outbreaks. Winds were particularly strong and sometimes gale force. During early afternoon, heavy showers pushed across the southeast of England, bringing hail and thunderstorms, and after it remained mostly dry and sunny, barring the odd shower. It was also windy. Northern Ireland and Scotland continued to see heavy rain into the evening.

Summary of the UK Weather for Sunday 24 May 2020

It was a cloudy and windy night for much of the UK with clearer skies in northeast Scotland and some clear spells in the far south. Although a dry night for many, rain, heavy at times, was seen across Northern Ireland and parts of the north west, this rain edging into northern England also. Elsewhere there were a few outbreaks of rain in central and southeastern England. A dry but cloudy start for most areas, barring the odd outbreak of rain across East Anglia, western Scotland and Northern Ireland. These outbreaks eased away during the morning. Areas of the southwest and Wales saw some clearer skies towards late morning with plenty of sunshine. The cloud continued to clear from the southwest with most parts of England, Wales and Northern Ireland seeing clear skies and sunshine during the afternoon. Winds were lighter than yesterday, but it was still breezy. Into the evening, the skies continued to clear, even across parts of southern Scotland.

Summary of the UK Weather for Monday 25 May 2020

A dry and rather chilly night across the UK with variable amounts of cloud, allowing for a good deal of clear spells, especially in the south. A touch of frost formed in prone spots towards dawn as well as a few fog patches in the south. The morning saw any fog lift with dry conditions and largely clear skies across the UK. Some thick cloud lingered however in northern England with cloud amounts increasing elsewhere across the north as rain edged into the west of Northern Ireland. The north became cloudy through the afternoon as the rain moved across Northern Ireland, reaching western and northern Scotland by late afternoon. Further south remained dry with plenty of sunshine, although some high cloud away from the far south. Through the evening rain in the northwest edged further inland and turned patchy with some outbreaks in the northeast and cloudy conditions persisting across the north. The south remained dry with just a little high cloud for some and thicker cloud building in the west. A windy day in the north.

Summary of the UK Weather for Tuesday 26 May 2020

A dry night across the UK, barring the odd shower across the southwest of Scotland during the early hours. Towards dawn, there was also the odd shower over north Yorkshire. It was overcast for most central areas, with the clearer skies across the south and Scotland. Winds remained light across the country, particularly inland. There was some lightning observed in the Bristol Channel towards dawn. A dry morning with plenty of sunshine for many parts of the UK. There was thick cloud however across northern England and Wales, with some outbreaks of rain, which sank southwards toward central England. There was some light rain in the southeast and far north also. Gaps in the cloud through central areas developed in the afternoon with sunny spells breaking through and any rain easing. Elsewhere was dry also with plenty of sunshine on offer but some, mainly high, cloud developing. Thicker cloud persisting in the far north. The evening remained dry with cloud and clear spells in central and many northern and western parts. The east saw the best of any clear weather.

Summary of the UK Weather for Wednesday 27 May 2020

A mostly dry night across the UK with light winds. During the early hours, rain pushed into parts of northern Scotland and continued into the morning. Northern Ireland saw some brief showers towards dawn. It was particularly foggy across southwest England and parts of Wales. Elsewhere saw clear skies. It was a mild night across the south but cooler in the north. Most parts saw a dry start to Wednesday with bright or sunny spells, the best of these in the south. Places further north saw cloudier skies with a few showers in northern England, as well as parts of Northern Ireland. Through the morning, showers faded away leaving the majority of the UK with a dry and warm afternoon with plenty of sunny spells. Cloud lingered across eastern England for much of the afternoon, though it started to break up later. Towards evening, a band of rain, heavy at times, arrived into northern Scotland and slowly pushed across the rest of the country, as well as into Northern Ireland.

Summary of the UK Weather for Thursday 28 May 2020

It was a dry night for much of the UK however a band of rain pushed east across the far north giving some heavy downpours at times. Elsewhere in the north it was largely cloudy with some clear spells breaking through whereas the south had patchy cloud with longer clear periods and the best of these in the southwest. Some mist and fog patches formed in some eastern parts later in the night. There was plenty of sunshine throughout the UK, with any remaining showers over Scotland clearing through the morning. It began to turn cloudier in the north and over Scotland during the evening, but it stayed dry with sunny spells. Light southeasterly winds throughout England and Wales.

Summary of the UK Weather for Friday 29 May 2020

It was a dry night across the UK with clear skies for most however it was cloudier in northern parts and also in the west away from the far south. Despite the cloud there were still plenty of clear spells breaking through. Fog patches formed in areas of the far northeast. Once the early morning fog across northeastern Scotland cleared it was another dry day with plenty of sunshine away from the far north and Northern Ireland, where there was a bit more cloud about.

Summary of the UK Weather for Sunday 31 May 2020

It was another dry and mild night throughout the UK, with plenty of clear skies. Any patchy cloud tended to be isolated to Northern Ireland and Scotland. The prevailing easterly was light for all regions. Towards dawn the UK saw predominantly clear skies, apart from in the northeast where some fog had formed. Any remaining patches of fog and mist soon cleared in the early morning sunshine. The rest of the day was warm with plenty of blue skies and sunshine, although some cloud did bubble up through the afternoon over central UK. It remained mostly dry, with some isolated showers dotted about.

Daily Weather Summary for Sunday 31 May 2020

Daily Weather Summary for Sunday 31 May 2020

None of the selected stations observed a day of sleet or snow falling or non-zero snow depth at 0900 UTC.

Guidance Notes

UTC = Universal Coordinated Time. For the UK UTC is the same as GMT (Greenwich Mean Time).

National boundaries shown on the European station map are for illustrative purposes only.

Daily extremes

- Daily extremes have been manually confirmed by Met Office Observations Quality Management as valid observations from the live database at the time of checking. However, more extreme values may still be possible if they occur after the time of production.
- Mountain stations above 500 masl are excluded from lowest temperatures, highest gust speeds and greatest snow depths at 0900 UTC. This is because they are not considered representative of low level areas.
- Counties quoted against each station are based on historical county boundaries pre-1974 and may not reflect current administrative boundaries.

Analysis charts and satellite imagery

- The satellite imagery is infra-red imagery from the geostationary MSG satellite.
- The rainfall image is derived from satellite data from MSG and rain-radar data. This represents a snapshot of instantaneous rain-rates at 0000 UTC and 1200 UTC and so does not necessarily reflect daily accumulations in the rainfall station map.
- Any analysis charts or satellite images which are unavailable will be displayed as white space.

Station maps

- The UK maps show station data for the same set of stations presented UK data table. These stations are selected to provide good spatial coverage across the UK; they represent only a fraction of the overall UK observing network.
- Wind speed maps show wind speed in Kt and direction both averaged over the hour up to the time of observation. 1 Kt = 1.151 mph.

Hourly station data

- The data tables provide spot hourly observations from synoptic messages at 0000 and 1200 UTC. Missing data are denoted by '-'.

- Pressures are mean sea level pressure in hPa.
- For UK stations, Gibraltar and Jersey, the wind speeds and directions are both averaged over the hour up to the time of observation. However, for European stations wind speeds and directions are both averaged over a 10-minute period up to the time of observation.
- Wind speeds are in Kt. Wind directions are stored in the database every 10 degrees and have been converted to the nearest point of the compass. These give the direction the wind is blowing from, not to.
- Cloud amounts are in Oktas from 0 (clear) to 8 (overcast). 9 indicates sky obscured (eg by fog).
- Air temperature and dew point temperature are in Celsius.

Temperature maps

- Daily maximum, minimum and grass minimum temperatures are in Celsius.
- The period for the daily maximum temperature on day D is defined from 0900 UTC day D to 0900 UTC day D+1.
- The period for the daily minimum and grass minimum temperatures on day D is defined as 0900 UTC day D-1 to 0900 UTC day D.
- On any given day D the minimum will typically occur in the early hours of the morning and the maximum in early afternoon.

Rainfall, sunshine and max gust speed maps

- Daily rainfall is in mm from 0900 UTC day D to 0900 UTC day D+1.
- Daily sunshine is in hours from Kipp and Zonen CSD1 automatic sunshine records. Bright sunshine is defined as exceeding 120 W/m².
- Max gust speeds are the daily max gust in Kt from 0000-0000 UTC

Snow maps

- The day of snow falling map displays data from present weather sensors, showing stations which have recorded sleet or snow falling at any point in the day (0000-0000 UTC).
- The snow lying map shows level snow depth as recorded by the automatic snow depth sensors at 0900 UTC. These snow depth sensors do not record snow depth if this is less than 1cm.
- Snow depth sensors are normally operational from October to April, in the event of snow falling outside this period data availability may be limited.
- Snow maps will only be displayed if one or more of the selected stations on that date have recorded either snow falling or non-zero snow depths. If snow maps are not

displayed it is still possible that other stations in the network have recorded a day of sleet or snow falling or non-zero snow depth.
