Daily Weather Summaries for February 2019

If you have any questions or feedback about this product or wish to obtain further data please contact the Met Office.

This document contains daily weather summaries for each day of February 2019. The Met Office National Meteorological Library and Archive holds a continuous record of daily weather summaries or daily weather reports from 1860, and these daily weather summaries form a continuation of that series.

The purpose of each summary is to provide an overview of the weather conditions across the UK on that day, with the historical emphasis mainly based on observations from surface network of weather stations, although the format has varied over the decades. While the emphasis remains on observations from the surface network, the current daily weather summaries supplement these by including satellite and rain-radar imagery to provide a more complete overview. The current format of the daily weather summaries is as follows:

1. Text summary of the main characteristics of the weather during the day, written by an operational meteorologist in the Met Office operations centre.
2. Table of daily extremes for the UK for key climate variables including temperature, rainfall, sunshine and gust speeds.
3. Overview of the synoptic situation at 00 and 12 UTC comprising: analysis charts showing the surface pressure pattern and associated weather fronts; North Atlantic and European infra-red satellite images showing cloud-cover; combined infra-red and rain-radar images of the UK; maps of wind speed and direction at 00 and 12 UTC; observations of pressure, wind speed and direction, cloud cover, air and dewpoint temperature at selected UK and European stations in data tables.
4. UK maps of key climate variables from observing stations including maximum, minimum and grass minimum temperature, rainfall, sunshine, gust speed and snow.
5. Further guidance notes

If you spot any data errors or omissions in this product please contact the Met Office.

Daily Weather Summary for Friday 01 February 2019

This day's summary created 12/02/2019 11:33

Summary of the UK Weather for Friday 01 February 2019

February began cold for the UK, with sleet and snow across the south of England and Wales. 14 cm accumulated at Dunkeswell Aerodrome. Elsewhere, sleet and snow showers moved into northern Scotland and northern England, but Northern Ireland stayed dry. Snow covered parts of northern Scotland had the coldest night for several years. The day continued to bring outbreaks of snow moving slowly across southern central England, with 19 cm lying at Odiham, Hampshire by the evening. Elsewhere wintry showers drifted in from the North Sea across northern and eastern areas. Much of Wales and southwest England remained dry but cold.

This day's summary created 12/02/2019 11:39

Summary of the UK Weather for Saturday 02 February 2019

Sleet and snow in the southeast gradually eased away through the night. However showers in the far north, east and west continued to feed in, and these were frequently falling as snow, especially away from immediate coasts. Elsewhere it was largely dry and with clear skies it turned cold. It wasn't as cold as recent nights for many.

After a cold and frosty start to Saturday, it was largely dry with good spells of sunshine for many. However, there have been some wintry showers down North Sea coastal areas, affecting parts of eastern England and East Anglia, with a few penetrating inland into southeast England for a time. A band of more organised showers extended down through the Irish Sea to affect Anglesey, Pembrokeshire and further south into parts of Cornwall during the morning, where they turned wintry over the hills. Any showers gradually eased through the afternoon, especially in the west, but kept going along North Sea coasts. Further sleet and snow showers continued to affect parts of northwest Scotland throughout the day.

This day's summary created 12/02/2019 11:39

Summary of the UK Weather for Sunday 03 February 2019

A few wintry showers affected coastal stretches of East Anglia and Cornwall for a time during the early hours. Much of the UK sat under clear skies right through the night. Later on in the night, thicker cloud moved into Northern Ireland and western Scotland, bringing some outbreaks of rain and hill snow across Scotland. Towards dawn, the rain and hill snow became more persistent in the northwest, but not very heavy. It was another very cold night, with temperatures below freezing for much of the UK. Minimum temperature across the glens of Scotland and northern England reached minus double digits. Many southern and some central parts remained dry through the day. However, the skies gradually clouded over from the northwest. Further north, cloud and outbreaks of rain and hill snow spread across Scotland, Northern Ireland and into northern England during the day. To the north, brightening skies emerged as the rain and snow cleared, leaving sunny spells and wintry showers in its wake. It was a windy day across many northern parts though, but temperatures still reached double digits in the southwest.

Summary of the UK Weather for Monday 04 February 2019

The new week started on a damp note as a broad band of rain moved east across the UK. Rain turned to snow over Scottish hills. Towards dawn the main band of rain cleared Northern Ireland, and it became drier in the west of Scotland and Wales. Rain and drizzle continued to clear much of England and Wales through the day, although it lingered across the far southeast of England. As a result, many places saw increasing amounts of sunshine into the afternoon. Occasional showers continued in the northwest and it felt colder here too.

Summary of the UK Weather for Tuesday 05 February 2019

It became dry for many during the early hours of Tuesday, with clear spells develop across many central, eastern and northern areas. Under the clearing skies some locally dense fog patches formed and a patchy frost. Meanwhile it became cloudier in the west with fog over the hills and outbreaks of light rain and drizzle spreading into Cornwall by morning.

Areas of fog in the east lifted only slowly into low cloud through the morning, giving a rather grey day. There were some heavy bursts of rain across Northern Ireland and parts of northwest England which gradually pushed east through the evening. Rain fell across Scotland with snow over the highest ground.

Summary of the UK Weather for Wednesday 06 February 2019

Heavy rain swept across the country, clearing most eastern areas in the early hours. However, cloud and patchy rain lingered in southeast England. A few mist and fog patches formed under clearing skies in the west with a touch of frost for some, while scattered showers affected western parts of Scotland.

Sunny intervals and shower continued in the northwest through the morning, with some wintry showers over the Scottish mountains. The showers merged to give some longer spells of rain and hill snow across Scotland in the afternoon. Elsewhere there were bright or sunny spells and isolated showers, apart from in the far southeast where it remained cloudy with patchy drizzle in the morning. Late in the day thickening cloud and rain spread into southern parts of England, promising a wet evening.

Summary of the UK Weather for Thursday 07 February 2019

It was a windy night across southern England and Wales as a band of rain moved across the country from the southwest. This turned to snow over some northern hills. Southeast England stayed largely dry with clearer skies. It was a generally mild night with most places staying frost free. Through the daytime the winds eased a little, and it was a day of sunny spells and showers. The showers were quite heavy in some western areas and mixed with hail at times. Later in the evening, cloud and rain spilled into western areas, associated with storm Erik.

Summary of the UK Weather for Friday 08 February 2019

Outbreaks of rain in the west became increasingly persistent and spread eastwards during the early hours of the morning, with some heavy rain across Scotland, Northern Ireland and west Wales by the end of the night. The wind strengthened too as Storm Erik approached, with gales developing in exposed western areas. It stayed very windy all day in the north of the UK, and also near the south coast of England where there were several reports of trees being blown over. The band of heavy rain swept across the UK from west to east, followed by some blustery showers. Rain was more persistent in northern Scotland.

Daily Weather Summary for Saturday 09 February 2019

This day's summary created 16/02/2019 02:00

Summary of the UK Weather for Saturday 09 February 2019

It was a very windy night with much of the UK seeing gusts of over 50 mph. A swathe of rain pushed southeastwards across Northern Ireland, Scotland and into northern England. Behind this blustery showers fed into northwest Scotland. Further south it was drier with some clear breaks, but there were still a few showers feeding in on the strong west to northwesterly wind. Showery rain with a little hill snow eased across mainland Scotland and Northern England during the morning, although rain continued to affect the Northern Isles throughout the day. Elsewhere there was sunshine and showers. Further more persistent rain edged in across some southwestern areas towards the evening. Gales in the north and east gradually eased, although it remained fairly blustery, with breezy conditions affecting other areas too. Temperatures were average to mild. During the evening rain edged in from the southwest across much of southern England and Wales. Rain also lingered across the Northern Isles. Elsewhere there were clear spells, with scattered showers towards the northwest.

This day's summary created 17/02/2019 02:00

Summary of the UK Weather for Sunday 10 February 2019

The early hours of Sunday saw a mix of clear spells and showers across northern and western parts. In southern and central parts though a more persistent band of rain and hill snow slowly moved eastwards. It was also a cold night for many parts of the UK, especially in the north under clearer skies, with some frost and fog patches here. The rain and hill snow slowly cleared the south during the day, although parts of East Anglia and southeast England hung onto the rain until the end of the afternoon. Otherwise, there was a mix of sunshine and scattered showers across much of the country, with the heaviest of the showers in the west. During the afternoon however, a band of more persistent rain and hill snow did move across Northern Ireland, before moving southeastwards into northwest England and north Wales by dusk. During the evening the rain across north Wales and northwest England continued southeastwards across England and Wales, with elsewhere seeing a mix of clear spells and scattered showers. Temperatures were average for this time of year.

Summary of the UK Weather for Monday 11 February 2019

There was variable cloud across the UK through the early hours of the morning. Two distinct areas of showers moved south. One area was across eastern Scotland, which moved south into northern England, and the other area of showers was across Wales, which moved into the West Country. Elsewhere it was dry with some clear spells and as a result temperatures dipped close to or just below freezing in places. A few icy stretches developed across eastern Scotland under clear skies after the passage of those earlier showers. During the day time, the showers eased, and southeastern areas saw the best of the sunshine. Further west, cloud began to spill across the UK, leaving many across southwest England and Wales with some hazy sunshine to end the day. It stayed dry for most, although rain arrived in Northern Ireland and western Scotland in the late afternoon, and continued into the evening. Temperatures were around average for the time of year, except in the southwest where they were a few degrees above average.

Summary of the UK Weather for Tuesday 12 February 2019

It was fairly cloudy overnight in the north and west, with bands of patchy rain crossing Scotland. Elsewhere, it was mostly dry, and there were some lengthy cloud breaks across parts of southern England and Wales, which allowed some dense fog patches to form, and temperatures to drop quite widely below freezing.

Rain faded across Scotland during the morning, although patchy rain affected west Wales and northwest England during the day. Elsewhere early fog cleared to give some bright weather. Sunny spells broke through the cloud across the north of Scotland, the Welsh Marches and some southern parts of England. It was windy across northern Scotland, with lighter winds further south, and temperatures generally became mild during the day.

Summary of the UK Weather for Wednesday 13 February 2019

Overnight, skies were cloudy across northern and western parts of the UK with patchy rain and drizzle in the northwest. Elsewhere it stayed dry, and with clearer skies in the south some fog patches formed. Most places were frost free but it turned chilly across parts of Aberdeenshire and southern England where skies were clearest for longest.

Through Wednesday morning, mist and fog patches cleared with many southern counties turning fine and sunny. The sunnier skies spread northwards through the day, although with high cloud around it often appeared hazy. Thicker cloud persisted across parts of Northern Ireland, northern England and north Wales, and in Scotland it was cloudiest in the west with sunshine further north and east. Winds were brisk in western and northern parts, but for all it was mild.

Summary of the UK Weather for Thursday 14 February 2019

Skies were cloudy through the early hours in northern areas, with brisk winds and patchy drizzle over Scottish hills. The blanket of cloud kept temperatures on the mild side. Further south, skies were clear for much of the night giving a patchy frost in southern England. Mist and fog patches also formed quite widely across southern England and Wales, with freezing fog in the coldest spots. Through the rest of the day the mist and fog steadily cleared, to leave most places dry, fine and sunny. Some cloud affected northern parts but a lot of this was thin high cloud. Winds were light for most, except in the north where it was breezy. It was chilly where fog lingered, but elsewhere temperatures were above average for the time of year.

Summary of the UK Weather for Friday 15 February 2019

In the early hours of the morning, clear skies across much of the UK caused temperatures to drop quickly. Dense fog formed across much of southern England, with patchy fog elsewhere. There was a frost in some central and eastern parts of the UK, but in the west it was milder. The lowest temperature was -4.5 Celsius at Eskdalemuir, Dumfriesshire.

The fog was slow to lift in some southern counties, but once it did it was a sunny day for much of the UK, with plenty of unbroken sunshine. A frontal system moved into Northern Ireland and western Scotland however, bringing cloudier skies and outbreaks of rain to the far west by the afternoon. The wind was light, and it was the warmest day of the winter so far, with the warmest temperatures in Wales and north Devon.

Summary of the UK Weather for Saturday 16 February 2019

It was a dry night across much of the UK with only some light and patchy rain and drizzle affecting western Scotland and Northern Ireland. There were some clear spells across central and northern parts but low cloud and hill fog spread across southern England and Wales. The winds were mostly light and it was a milder night than of late for most. Under the clearest skies in the south east however, some freezing fog formed.

Through the morning the low cloud from the southwest replaced the fog in the southeast, with a grey, murky day for many central and southern counties. There was some light and patchy rain and drizzle for Wales and the southwest, and the best of the brightness was in northern England, with some sunshine for Yorkshire. It was a breezy day, with strong winds around northern and western coasts, and by the end of the afternoon thicker cloud and rain inched into Northern Ireland and western Scotland.

Summary of the UK Weather for Sunday 17 February 2019

Rain edged east across Northern Ireland and western Scotland overnight. Elsewhere it was dry, with some lengthy clear periods developing. Some patches of fog formed across eastern England, with a local ground frost in the south east. It was generally breezy, and windy in the northwest.

During the day there were some good spells of sunshine at first in central and eastern areas, before a narrow bank of cloud and outbreaks of rain spread east across the country. Behind the rain sunshine developed in the west with a few showers for Northern Ireland and western Scotland. It was another very mild day, as southwesterly winds brought warmth from the Azores.

This day's summary created 25/02/2019 02:00

Summary of the UK Weather for Monday 18 February 2019

It was a mild start to the new working week for most. Blustery showers moved in from the northwest overnight, with some sleet over Scottish hills. It was windy in the north and west but it was a quieter night for central and southeastern England, where there were some clear spells. There was an early patchy frost in the north before cloud rolled in here.

During the day, cloud and outbreaks of rain continued to plague central and eastern parts of England, where it felt colder than recent days. Elsewhere, skies were brighter but scattered showers continued to push in across western and northern areas, with the odd heavy and thundery burst. It was windy in the north and west too, so showers moved through quite quickly, but for all it was cooler than recent days.

Summary of the UK Weather for Tuesday 19 February 2019

Through the early hours of Tuesday morning there was patchy rain in northwestern areas, but for most it was dry with clear spells across Wales and southern England. Under clear skies a few pockets of shallow mist and fog formed, and across the south temperatures were low enough for a touch of frost. After a cold and frosty start here, many southern and eastern areas saw a dry day with spells of sunshine. A few fair weather clouds bubbled up through the day, and a veil of high cirrus cloud invaded from the west turning the sunshine increasingly hazy. Eventually northern and western areas become cloudy with rain gradually spreading eastwards across Scotland, Northern Ireland, northern England and parts of Wales by the end of the afternoon. The rain was accompanied by a freshening breeze, particularly through the Irish Sea where some of the strongest gusts of wind were recorded. Despite this it was mild for most areas, with temperature above average for late February, right the way across the country.

Summary of the UK Weather for Wednesday 20 February 2019

The early hours of Wednesday were mild and mostly cloudy across the UK, with outbreaks of rain and strengthening winds pushing in across northern and western areas. The rain became more persistent across Cumbria but elsewhere, it was lighter and more sporadic. Skies remained clearer across some southeastern parts of England as well as the far north of Scotland so it turned chillier here although all parts remained frost free. During the day it remained cloudy and breezy in western parts, with occasional outbreaks of rain and drizzle. This was persistent across parts of northwest England, especially Cumbria where the rain was heavy and lasted for much of the day. Some rain also spread into the north Midlands and northeast England during the afternoon. Elsewhere, it was bright and largely dry with eastern and southeastern England seeing the best of any longer spells of sunshine. After a cloudier morning, northeast Scotland also saw skies brighten with plenty of sunshine here through the afternoon. It was a mild day for most of us, with temperatures well above average, especially where we saw the sunshine.

Summary of the UK Weather for Thursday 21 February 2019

During the early hours of Thursday it was a messy weather picture across the UK, with many areas cloudy, with some areas of low cloud. This gave a few pockets of mist and hill fog for some, and the cloud was thick enough in northern and some western areas for a little drizzle. The far southeast of England and northeast Scotland were clearer and colder with a touch of frost in Scotland. In contrast some areas were exceptionally mild for this time of the year. Much of Thursday morning was cloudy for many parts of the UK, with some rain affecting western Scotland and East Anglia. Towards lunchtime though skies cleared across many parts of England, Wales and eastern Scotland allowing some lengthy spells of sunshine to develop. The sunshine then became even more extensive during the afternoon with Northern Ireland also seeing some sunny skies, although some low cloud did spread into some English Channel counties. In the sunshine though it became very mild for the time of the year, with Scotland recording its warmest February day on record.

Summary of the UK Weather for Friday 22 February 2019

Through the early hours of Friday morning areas of low cloud developed over much of central and southern England, with some dense fog in places by morning. Patchy fog formed elsewhere under clear skies across Wales and Northern England, whilst thicker cloud spread across Northern Ireland and western Scotland, bringing some patchy rain by the end of the night.

Low cloud and fog slowly cleared central, southern and eastern parts of England during Friday morning, leaving a dry day, with some good spells of sunshine for many. Meanwhile, it has been a cloudier day across the northwest of Scotland, with some rain affecting the Western Isles later in the day. It has been another very mild day for many. However, some southern coasts of England have been cooler, particularly where low cloud has lingered throughout the day.

Summary of the UK Weather for Saturday 23 February 2019

Low cloud, mist and fog developed across much of central, eastern and southern England. The northwest of the UK remained dry, very mild and breezy, with a few clear spells. Under any clearer periods across southern England and Wales, temperatures dipped allowing a slight frost in places. There was a large temperature contrast over the UK through the night.

The fog and low cloud was slow to clear in places, with some of the fog lingering across Lincolnshire and Yorkshire into the afternoon. At the same time a band of cloud and some occasional rain gradually moved into Northern Ireland and Scotland, giving a rather overcast and damp afternoon here. Elsewhere though there was a sunny and very mild afternoon.

Summary of the UK Weather for Sunday 24 February 2019

The early hours of Sunday were dry, with clear spells for much of the UK. Irish Sea coasts though saw low cloud and fog roll in from the sea, with some mist and fog patches also developing inland across England and Wales. Towards dawn some high cloud started to move into Scotland and Northern Ireland, but there was also an air frost here.

Fog was slow to clear throughout the morning, and lingered until the afternoon in some places in the Midlands in particular. Otherwise there was plenty of spring-like sunshine, and very mild temperatures. Gogerddan in Wales recorded 19.1 Celsius, making it the warmest Welsh February day on record.

Summary of the UK Weather for Monday 25 February 2019

Through the early hours of the new working week, an air frost developed in prone spots of central and southern England, and in Wales. There were some freezing fog patches here, as well as mist and fog patches for much of England and southern Scotland. Otherwise it was a largely dry night, although patchy rain moved across northern Scotland.

Through the morning the frost melted away and the fog lifted, leading to a fine and sunny day with wall to wall blue skies across most of the country. The far northwest of Scotland remained cloudier at times but for all it was dry. It was a record breaking day in terms of temperatures, with an impressive maximum temperature of 20.6 Celsius recorded at Trawsgoed in west Wales. This not only made it the highest temperature to ever be recorded in February across the UK, but also the first time that 20 degrees has been recorded in the meteorological winter (Dec-Jan-Feb). Through the evening it turned chilly again as skies remained clear.

Daily Extremes

<i>Highest Maximum</i>	20.6°C Trawsgoed (Dyfed, 63mAMSL) also Teddington, Bushy Park (Middlesex, 9mAMSL)

Summary of the UK Weather for Tuesday 26 February 2019

It was quiet through the early hours, with clear skies for much of the UK. There were isolated pockets of mist and fog but it was dry across the country. With light winds, there was a widespread frost.

The patchy mist and fog quickly cleared during the morning leaving a fine and sunny day across the country, the only exceptions being the northwest of Scotland where it was rather cloudy. It was another unseasonably and exceptionally warm day for this time of year, with some record breaking maximum temperatures.

Summary of the UK Weather for Wednesday 27 February 2019

It was a quiet night across the UK, with clear skies for many. This allowed some mist and fog patches to form in places, especially across southern and eastern parts of England. It was a chilly night for many, with a touch of frost in places. Meanwhile, there was thicker cloud with some rain near the far northwest of Scotland, but even here it remained dry throughout. Patchy mist and fog soon cleared and then most places had a fine and dry day with plenty of sunshine. Misty low cloud plagued the far southwest, and also some Irish Sea coasts, and parts of northern and western Scotland remained rather cloudy, but dry. It was another very warm day.

Summary of the UK Weather for Thursday 28 February 2019

Fog developed overnight across many areas, although this lifted from southern and southwestern parts through the early hours as the breeze picked up. Despite this it remained murky across eastern areas with some frost as well as some dense patches of fog across northern England and Northern Ireland. By morning showers pushed in across Wales and the SouthWest. During the day showers continued to push across England and Wales with some heavy ones in places. It was windy across southern counties from England but this also led to a few sunny spells. Northern areas remained drier with some brightness, especially across western Scotland. It was another mild day, but not as warm as recently.

Daily Extremes

<i>Highest Maximum</i>	14.5°C Cavendish (Suffolk, 55mAMSL)
<i>Lowest Maximum</i>	5.0°C Spadeadam No 2 (Cumbria, 285mAMSL)
<i>Highest Minimum</i>	9.1°C Camborne (Cornwall, 87mAMSL)
<i>Lowest Minimum</i>	-2.8°C Aviemore (Inverness-shire, 228mAMSL) also Ravensworth (North Yorkshire, 120mAMSL)
<i>Lowest Grass Minimum</i>	-7.5°C Copley (Durham, 253mAMSL) also Wallington (Northumberland, 150mAMSL)
<i>Most Rainfall</i>	14.0mm Hawarden Airport (Clwyd, 11mAMSL)
<i>Most Sunshine</i>	4.9hr Preston, Cove House (Dorset, 44mAMSL)
<i>Highest Gust</i>	40Kt 46mph Wight: Needles Old Battery (Isle Of Wight, 80mAMSL)
<i>Highest Gust (mountain)</i>	24Kt 28mph Glen Ogle (Perthshire (in Central Region), 564mAMSL)
<i>Greatest Snow Depth at 0900 UTC</i>	No non-zero values

mAMSL refers to station elevation in metres above mean sea level

Daily Weather Summary for Thursday 28 February 2019

Daily Weather Summary for Thursday 28 February 2019

None of the selected stations observed a day of sleet or snow falling or non-zero snow depth at 0900 UTC.

Guidance Notes

UTC = Universal Coordinated Time. For the UK UTC is the same as GMT (Greenwich Mean Time).

National boundaries shown on the European station map are for illustrative purposes only.

Daily extremes

- Daily extremes have been manually confirmed by Met Office Observations Quality Management as valid observations from the live database at the time of checking. However, more extreme values may still be possible if they occur after the time of production.
- Mountain stations above 500 masl are excluded from lowest temperatures, highest gust speeds and greatest snow depths at 0900 UTC. This is because they are not considered representative of low level areas.
- Counties quoted against each station are based on historical county boundaries pre-1974 and may not reflect current administrative boundaries.

Analysis charts and satellite imagery

- The satellite imagery is infra-red imagery from the geostationary MSG satellite.
- The rainfall image is derived from satellite data from MSG and rain-radar data. This represents a snapshot of instantaneous rain-rates at 0000 UTC and 1200 UTC and so does not necessarily reflect daily accumulations in the rainfall station map.
- Any analysis charts or satellite images which are unavailable will be displayed as white space.

Station maps

- The UK maps show station data for the same set of stations presented UK data table. These stations are selected to provide good spatial coverage across the UK; they represent only a fraction of the overall UK observing network.
- Wind speed maps show wind speed in Kt and direction both averaged over the hour up to the time of observation. 1 Kt = 1.151 mph.

Hourly station data

- The data tables provide spot hourly observations from synoptic messages at 0000 and 1200 UTC. Missing data are denoted by '-'.

- Pressures are mean sea level pressure in hPa.
- For UK stations, Gibraltar and Jersey, the wind speeds and directions are both averaged over the hour up to the time of observation. However, for European stations wind speeds and directions are both averaged over a 10-minute period up to the time of observation.
- Wind speeds are in Kt. Wind directions are stored in the database every 10 degrees and have been converted to the nearest point of the compass. These give the direction the wind is blowing from, not to.
- Cloud amounts are in Oktas from 0 (clear) to 8 (overcast). 9 indicates sky obscured (eg by fog).
- Air temperature and dew point temperature are in Celsius.

Temperature maps

- Daily maximum, minimum and grass minimum temperatures are in Celsius.
- The period for the daily maximum temperature on day D is defined from 0900 UTC day D to 0900 UTC day D+1.
- The period for the daily minimum and grass minimum temperatures on day D is defined as 0900 UTC day D-1 to 0900 UTC day D.
- On any given day D the minimum will typically occur in the early hours of the morning and the maximum in early afternoon.

Rainfall, sunshine and max gust speed maps

- Daily rainfall is in mm from 0900 UTC day D to 0900 UTC day D+1.
- Daily sunshine is in hours from Kipp and Zonen CSD1 automatic sunshine records. Bright sunshine is defined as exceeding 120 W/m².
- Max gust speeds are the daily max gust in Kt from 0000-0000 UTC

Snow maps

- The day of snow falling map displays data from present weather sensors, showing stations which have recorded sleet or snow falling at any point in the day (0000-0000 UTC).
- The snow lying map shows level snow depth as recorded by the automatic snow depth sensors at 0900 UTC. These snow depth sensors do not record snow depth if this is less than 1cm.
- Snow depth sensors are normally operational from October to April, in the event of snow falling outside this period data availability may be limited.
- Snow maps will only be displayed if one or more of the selected stations on that date have recorded either snow falling or non-zero snow depths. If snow maps are not

displayed it is still possible that other stations in the network have recorded a day of sleet or snow falling or non-zero snow depth.
