Daily Weather Summaries for March 2023

If you have any questions or feedback about this product or wish to obtain further data please contact the Met Office.

This document contains daily weather summaries for each day of March 2023. The Met Office National Meteorological Library and Archive holds a continuous record of daily weather summaries or daily weather reports from 1860, and these daily weather summaries form a continuation of that series.

The purpose of each summary is to provide an overview of the weather conditions across the UK on that day, with the historical emphasis mainly based on observations from surface network of weather stations, although the format has varied over the decades. While the emphasis remains on observations from the surface network, the current daily weather summaries supplement these by including satellite and rain-radar imagery to provide a more complete overview. The current format of the daily weather summaries is as follows:

1. Text summary of the main characteristics of the weather during the day, written by an operational meteorologist in the Met Office operations centre.
2. Table of daily extremes for the UK for key climate variables including temperature, rainfall, sunshine and gust speeds.
3. Overview of the synoptic situation at 00 and 12 UTC comprising: analysis charts showing the surface pressure pattern and associated weather fronts; North Atlantic and European infra-red satellite images showing cloud-cover; combined infra-red and rain-radar images of the UK; maps of wind speed and direction at 00 and 12 UTC; observations of pressure, wind speed and direction, cloud cover, air and dewpoint temperature at selected UK and European stations in data tables.
4. UK maps of key climate variables from observing stations including maximum, minimum and grass minimum temperature, rainfall, sunshine, gust speed and snow.
5. Further guidance notes

If you spot any data errors or omissions in this product please contact the Met Office.

Daily Weather Summary for Wednesday 01 March 2023

This day's summary created 08/03/2023 03:03

Summary of the UK Weather for Wednesday 01 March 2023

The UK was in an easterly wind regime, as a result some isolated showers were recorded along the northeastern coast of England, these increased in size and frequency through the night in the far northeast. A convergence feature situated in the English channel moved east through the night bringing the odd light shower to the far south of England. Elsewhere it was a dry night, but cloudy for most, with northwestern Scotland seeing the clearest conditions. The northeasterly flow continued throughout the day, bringing the scattered showers inland from the northeast coast. These reached much of central England by the afternoon, and slightly dispersed as they reached Wales and the southwest. Elsewhere it was generally dry with some sunny spells in between varying amounts of cloud. Western Scotland saw the best of the sunny weather. By the evening, the showers continued to feed inland and it remained largely cloudy, but under clear skies, northern Scotland and southeast England saw some patchy frost.

Summary of the UK Weather for Thursday 02 March 2023

High pressure dominated most parts of the UK. As a result, cold, clear and dry conditions were observed across most parts of the country. However, from midnight rain and showers affected some parts of west Scotland and north, central, and southwest of England. Through the remainder of the day, the northeasterly regime continued. West Scottish showers persisted, gradually moving southwestwards as further showers followed from the North Sea. Elsewhere the picture remained the same, dry and often cloudy conditions, with the south west seeing some sunny spells and clear skies into the evening.

Summary of the UK Weather for Friday 03 March 2023

High pressure continued to dominate the UK, allowing a light northeasterly to northerly flow to develop. It was rather cloudy for most parts, the cloud thick enough in southern Scotland, northern England and parts of Northern Ireland for a few showers, though these had cleared by dawn. Skies were clearer in western Wales and southern England where frosts formed. Cloud cover persisted throughout the day, remaining mostly dry with a few scattered light showers across Northern Ireland and northeast England until midday, where overcast conditions took over. During the afternoon, further sparse, light showers developed over the southeast although these were quick to clear, leaving a dry but cool evening for all. Early frosts began to develop in areas where cloud cleared, mainly western Scotland.

Summary of the UK Weather for Saturday 04 March 2023

With high pressure centred to the northwest of the UK, a weak cold front arrived from the northeast through the early hours. This front brought colder weather and patchy rain into the Northern Isles, with a touch of wintriness over mountain tops. Further light showers continued to feed inland from the North Sea, mainly affecting eastern coasts. It was a rather cloudy start for most, with only small cloud breaks across southern and eastern Scotland, meaning that aside from pockets of ground frost in these regions it was a largely frost-free morning. Patchy showers continued to make unsteady progress southwards through the day, passing through Scotland and much of eastern England, whilst Wales, Northern Ireland and western parts remained largely dry. Western Scotland in particular saw some sunny spells, gradually spreading southwards towards northern England, but there were very few cloud breaks elsewhere. Into the evening, showers continued along eastern coasts and for parts of western Wales. Any gaps in the cloud cover had filled in by midnight, with some patchy fog developing in eastern Scotland in particular.

This day's summary created 12/03/2023 03:03

Summary of the UK Weather for Sunday 05 March 2023

High pressure remained centred off the west coast of Ireland whilst a low pressure centre approached from the north through the day, bringing a mixed frontal system over northeast Scotland and eastern coasts by midnight. This brought dense cloud and patchy showers where the cloud was dense, mainly to the northeast and parts of Northern Ireland, with wintriness over modest hills. Further showers continued to feed in from the North Sea during the early hours, while some southern areas began to see breaks in the cloud. Through the day, scattered showers continued to push southwards through Scotland and parts of Northern Ireland. As a cold front approached from the north, more organised rain and snow affected parts of Scotland from around 1000UTC. By the afternoon, Wales and southwestern England started to see some light showers, especially over higher ground. These showers had largely dissipated from the southwest by midnight, while northern Wales and the northwest saw the arrival of some rain at around 1900UTC. Cloud cover was fairly widespread through the day, although there were some sunny spells reported in coastal areas.

This day's summary created 13/03/2023 03:03

Summary of the UK Weather for Monday 06 March 2023

At midnight, a triple-point frontal system covered Scotland and the east coast, with a separate occlusion over Wales. This brought locally heavy rain, showers and hill snow to these areas. Arctic air allowed snow to settle at lower levels, particularly across the Northern Isles and parts of mainland Scotland. By dawn, the system had moved across the northeast, with signs of clearer, colder and much windier conditions following from the north.

Elsewhere, it was a cloudy start for many. The frontal system continued to track southeastwards through the day, bringing plenty of cloud across much of the UK, save for a few clear spells. In the north, frontal precipitation fell as rain, sleet, and snow, the latter predominantly across high ground. Showers elsewhere fell as rain through the course of the day, and into the night. The nearby low pressure system brought breezy conditions along eastern coasts of England and Scotland, leading to the daytime temperatures feeling closer to freezing in these parts. A widespread frost developed over Scotland and much of northern England into the night.

This day's summary created 15/03/2023 10:42

Summary of the UK Weather for Tuesday 07 March 2023

It was a mixed start to the day, with a cold front closely followed by an occlusion moving slowly southwards through the morning. This brought a concentrated band of rain and sleet through much of central England and Wales through the early hours, reaching southern England by dawn. There were some clear skies across northern England, southern Scotland and Northern Ireland, but elsewhere, cloud cover was widespread. There were snow showers across northern Scotland through the morning, whilst the northeast coast saw a few wintry showers. From early morning, wintry showers or longer spells of rain affected northern and northwestern Scotland, and central and southern England, particularly heavy in northern Scotland. The rest of the UK had cold and dry conditions.

Summary of the UK Weather for Wednesday 08 March 2023

A north-south split in the weather continued through the early hours into the morning, with the southern half of the country lying under cloudy skies, while it remained largely clear elsewhere, save for any cloud associated with showers. In northeastern areas, these showers fell predominantly as snow, as well as sleet and rain. Across southern parts of England and Wales, most outbreaks reached the ground as rain, though the occasional sleet or snow was seen atop higher ground. Temperatures were low throughout, leading to a widespread frost, severe for most. Winds remained generally light, however. Through the early morning, low pressure persisted across central and southern parts of UK, which brought rain, snow and sleet to Wales and the Midlands, whilst showers and rain continued across central and southern parts of England, and some parts of northern Scotland. Locally heavy rain affected southern parts of the country.

Summary of the UK Weather for Thursday 09 March 2023

Across Northern Ireland, Scotland, and northern England, skies remained largely clear through the early hours, save for cloud across northernmost areas of Scotland and northeastern coasts of England, which brought some showers of snow, sleet, and rain. Meanwhile across much of Wales and southern and central England, a band of rain and snow approached from the west, bringing widespread wet conditions to these areas. Temperatures were lowest under clear skies in the north, where a widespread frost formed. As a result of a frontal system and a low to the west of the UK, the wet and wintry conditions moved northwards through the day. This brought heavy snow to places in northern Wales and the north of England, causing some travel disruption. Scattered showers followed the fronts to the south, falling as rain mostly, due to the milder temperatures here. Cloudy for the majority with the far north of Scotland seeing the clearest of conditions.

Summary of the UK Weather for Friday 10 March 2023

A warm front across the centre of England, brought with it a mixture of rain, snow and sleet throughout the early hours across much of northern England, the Midlands and Wales, moving gradually southeastwards towards dawn. Elsewhere conditions remained largely dry except some scattered showers, locally heavy in the south. Northeasterly winds were strong throughout the night, especially on the eastern coasts of the country. Wintery showers across the Midlands and southeast continued southeastwards, mostly clearing land by midday but was followed by scattered showers. Central parts were clearer with sunny spells. During the afternoon, parts of the southwest, mainly Cornwall, saw some heavier rain as a result of a warm front lying off the coast. Further wintry showers continued across the Scottish highlands. Storm Larisa began to draw down some cold northerly air into the evening which, amplified by the clearing skies, led to a very cold night with sharp overnight frost with most areas below freezing.

Summary of the UK Weather for Saturday 11 March 2023

Through midnight, a high pressure ridge dominated most parts of the UK that brought dry, clear and cold weather conditions across most parts of the country. However, showers and rain affected Wales, some parts of southwestern England and few areas of northwestern Scotland, with particularly heavy rain in parts of the southwest. These showers continued in a northeasterly direction through the remainder of the day. Scottish showers promptly cleared, while southwestern showers developed into a large band of rain that generally made landfall with the west coast by midday. Snow fell in parts of Wales and Scotland as the band made its way across the UK over the course of the day and into late evening.

This day's summary created 19/03/2023 03:03

Summary of the UK Weather for Sunday 12 March 2023

Sunday started with bands of organised precipitation in western Scotland and along the north eastern coast of England. A few isolated showers developed in the south and south east. Elsewhere it was mostly dry, although cloudy. These bands of precipitation moved away to the northeast resulting in a dry morning for most, with a few localised showers in Scotland and northern England. Bands of rain moved eastwards across the UK with the heaviest of downpours in southern Wales and parts of southwest England. For the most part it remained dry in the east and across much of southern Scotland. Winds were moderate for most, with the strongest of gusts felt around the coast, picking up inland into the evening.

Summary of the UK Weather for Monday 13 March 2023

*A cluster of occluded, warm and cold fronts lay over the UK at midnight, bringing unsettled, wet weather to most of the UK, the heaviest of which in south Wales and Scotland, where some fell wintry as a mix of sleet/hail/snow. Clearer spells were observed in parts of central and southeast England at first, but were replaced by showers as the northeastern flow pushed this weather system across the country through the early hours. Strong winds and severe gales were recorded towards the south, with gusts pushing 60mph. Heavy showers continued to push eastwards through the day, falling as sleet or snow to low levels in places. Strong winds continued to cause travel disruption across the south, causing a yellow warning for wind to be issued for parts of England and Wales. By the evening, precipitation had largely ceased in the far north, but continued in southern Scotland, Wales, Northern Ireland and across parts of England, with northern parts clearing further by midnight, leaving the most significant rainfall across northern and eastern England. There were some sunny spells through the day, especially for eastern coasts.

This day's summary created 21/03/2023 03:03

Summary of the UK Weather for Tuesday 14 March 2023

At midnight, rain with some hill snow affected the southeast, central and northern England, heaviest across northern parts in an organised band of rain and sleet that extended over Northern Ireland. Elsewhere saw scattered showers broken by clearer spells, with some more persistent snow showers over the Scottish Highlands. These systems moved southeast during the early hours, which brought heavier wintry showers to central Scotland, Wales and central England. Through the early morning low pressure persisted across northern parts of UK, which brought showers, rain and snow across most parts of Scotland and northern and southeastern England, whilst dry and cold conditions with some sunny spells were observed for the rest of the country. After midday, showers and rain affected central and southern parts of England and some parts of northern and northwestern Scotland, particularly heavy rain affected southern parts of the country and highlands of Scotland.

Summary of the UK Weather for Wednesday 15 March 2023

During the early hours, most parts of the UK were dry and clear. Cloud started to build up from the southwest, covering southwest England and Wales. By dawn, this led to the development of scattered showers in the far southwest. Showers were also seen in the far west of Scotland throughout the early morning. In the early morning showers and rain affected southwestern parts of the country, whilst dry and cold conditions persisted elsewhere. From late morning, showers and rain continued in southwestern England and spread towards central and western Scotland. Through the afternoon, low pressure dominated most of the country. This brought showers and rain to most areas, and particularly heavy rain over northern Wales.

Summary of the UK Weather for Thursday 16 March 2023

A frontal system to the west of the UK brought cloud and rain to much of the country during the early hours, with the driest areas being southwest and southern England. Northern Ireland saw the most rainfall due to the location of the low pressure system to the west. Despite the unsettled weather, cloudy skies across most of the country prevented temperatures dropping as low as of late, leading to a relatively mild night. Winds gradually strengthened through the period. By dawn, much of southern and central England and Wales was clear of rain, with showers beginning to affect southwestern parts. Much of England was left in the warm sector through the day. This resulted in a cloudy, damp and windy day for many, with the heaviest rain initially in the north. This rainfall decayed to leave scattered showers across England and Wales by the evening. Much of Scotland initially saw rain, but this cleared to the far north by the evening, with some showers remaining in the west. Thundery conditions were seen over Northern Ireland.

This day's summary created 24/03/2023 03:03

Summary of the UK Weather for Friday 17 March 2023

The early hours were dominated by cloudy conditions and wet weather for many, due to a region of low pressure situated off the northeast coast of Scotland, with much of the country sitting in the warm sector of the associated frontal system. However, due to another area of low pressure west of Ireland, showery conditions prevailed. Northern Ireland, Scotland, and northern England saw the most precipitation, whilst central and southwestern England remained largely dry. Cloud cover prevented temperatures from dropping below freezing, and it remained mild in the south with light winds. Cloud covered much of the UK throughout the morning with scattered showers in the west, and a band of rain approaching southeast England. This band of rain moved further eastwards bringing moderate rain to East Anglia but had cleared the coast by 1600. The remainder of the country was covered in scattered showers, which developed throughout the day. Sferics were detected in northern England in the afternoon. Cloud covered much of the UK into the evening, with a band of scattered showers moving northeastwards across the country.

Summary of the UK Weather for Saturday 18 March 2023

Scattered showers were prevalent through the early hours, moving slowly northeastwards towards dawn as a result of a low pressure system near Northern Ireland. The associated frontal system brought cloudy conditions from the west, while a warm front pushed northwards over Scotland, bringing more organised rainfall. Wales and central England remained largely dry, but continued to see some sporadic showers. It remained mild across the country, especially under more persistent cloud cover. At 0700, large parts of northern Scotland were covered in rain or showers. The rest of the UK was mostly dry except the far south east and a few scattered showers elsewhere. Through the morning, the rain in the south east moved northwards, starting to break up around 1100 and becoming more showering in the afternoon. Rain in Scotland moved westwards throughout the day, becoming locally heavy in places. A mixture of further scattered showers as well as some brighter spells developed across the rest of the country into the afternoon. Into the evening and overnight, showers and rain were predominantly focused in more northern areas but most had cleared off the east coast by the end of the day.

Summary of the UK Weather for Sunday 19 March 2023

A band of showers east of the Pennines at midnight, and stretching further south through the centre of southern England. Some light showers in southern Suffolk. The rest of the UK was mostly dry, with the majority of cloud in the east. These showers moved east through the night, and resulted in some heavy isolated showers in the far southeast for a time, but these cleared by daylight. It was a mostly dry start to the day, with clear skies in central and southern England. It continued to be a dry day for much of the UK, due to a ridge of high pressure. A sunny and clear day for some, with the south and east seeing the best of the sunshine. Into evening, a frontal band moved in from the west, bringing rain to Scotland, Wales and eastern England. Further into the night, the rain in the south decayed, whereas the band continued to move eastwards in the north, resulting in a wet night for much of Scotland and northern England.

Summary of the UK Weather for Monday 20 March 2023

At midnight and through the early hours, cloud covered the entirety of the UK. Low cloud and fog covered northern areas of Scotland until around 0600. The whole country remained dry through the early morning. The day remained cloudy throughout, save for a few bright spells across parts of central England, though these were short-lived. As a region of low pressure continued to push eastwards off the east coast of Ireland, it brought a front system across the UK, with two bands of rain leading to wet conditions for many through the morning and afternoon. The northern band affected Scotland and northern England, with Northern Ireland and East Anglia seeing more patchy precipitation. The second, southern band brought rain to south Wales and southern England, with central areas affected the driest conditions overall. Winds gradually strengthened throughout, but temperatures remained mild under the broad cloud cover.

This day's summary created 28/03/2023 03:03

Summary of the UK Weather for Tuesday 21 March 2023

Near midnight, low pressure dominated most parts of the UK, which brought showers and rain across most parts of the country. Particularly heavy rain affected across western parts of Scotland and southwestern England. Showers and rain continued most of Scotland and north England, whilst showers and rain gradually cleared from central and Southern parts of England. Through the day, two distinct frontal systems brought wet and windy conditions to much of the UK. Through the morning, a band of rain cleared northeast Scotland, which brought the whole country into the warm sector. Showers developed across most areas, these heavier in the west, with the driest conditions in southeast England. The second front reached Northern Ireland in the early afternoon, bringing widespread rain. Wales and western coasts of England and Scotland before were affected later, with rain spreading to eastern areas by midnight. The rainfall was heaviest across western upslopes. Due to the extensive cloud cover, temperatures remained mild through, but blustery conditions led to many areas feeling cooler than of late.

Summary of the UK Weather for Wednesday 22 March 2023

From midnight low pressure was centred near Scotland, resulting in unsettled conditions for most parts of the country. This brought widespread showers and rain, with particularly heavy rain affecting the west. In the early morning, showers and rain gradually decreased from central and southwestern England, but continued elsewhere. It was very breezy with occasional gales along Irish Sea coasts. As the morning progressed, a cold front associated with the low pressure system cleared the southeast, resulting in clear skies across southern Scotland, northern England and Wales for a time. Frontal cloud cleared southeast England at around 1200, leaving patchy cloud across much of the country, while scattered showers returned to Wales and Northern Ireland, and continued in Scotland. During the early afternoon, some more organised cloud approached from the southwest, bringing showers and some Sferics to parts of the south. An occlusion moved eastwards into the evening, bringing more organised rainfall and cloud to Wales and western England, while showers dissipated slightly across Scotland, leaving clear skies in the far north and along some eastern coasts.

Daily Weather Summary for Thursday 23 March 2023

This day's summary created 30/03/2023 03:03

Summary of the UK Weather for Thursday 23 March 2023

A low pressure area centred off northwest Scotland dominated the night's weather. A series of frontal systems and troughs caused rain and showers that progressed eastwards, clearing the southeast by 02Z, but remaining over northern Scotland throughout. A further band of rain skimmed south of Northern Ireland and progressed into northwest England throughout the rest of the morning, stagnating then slowly breaking up here. In between the rain, skies were generally clear, particularly over central and southern England, meaning that after dawn, these areas saw a bright and sometimes sunny start to the day. Bands of rain and showers continued moving east throughout the remainder of the day, bringing large areas of cloud with them. Scottish rain cleared the northeast coast by midday, while scattered showers persisted across the central and southern England. Further substantial rain, very heavy at times, made landfall in the southwest just before midday, tracking northeast and covering most of the south by mid-afternoon. This continued through the evening, and generally cleared the Norfolk coast by midnight.

This day's summary created 31/03/2023 03:03

Summary of the UK Weather for Friday 24 March 2023

A low centre moved westwards towards Scotland overnight, bringing scattered showers, heavy at times, across northern regions, some of which turned wintry over high ground. Further showers spawned in the Irish Sea a few hours after midnight and moved over northern England. It was predominantly cloudy over Scotland, Northern Ireland and the north of England, albeit with some clear spells, however the clearest conditions were across central and southern England, where most areas awoke to some sunshine. The southwesterly regime continued as heavy showers moved across the central belt and Southern Scotland through the morning, while further lighter, scattered showers followed for much of the UK. Another low centre pushed over Northern Ireland by midday, bringing bands of more organised showers, these heavy at times, over Northern Ireland and into the northern and central England into the late evening. Elsewhere showers with clearer intervals persisted.

This day's summary created 01/04/2023 03:03

Summary of the UK Weather for Saturday 25 March 2023

The low pressure centre over southwest Scotland continued to bring showers across many northern regions, these tuning wintry over high ground in Scotland. The best of the drier conditions were further south and east, however it was a cloudy night for most with only a few clear spells. The low centre continued to push eastwards, reaching the northeast coast of England around dawn. It remained breezy for most with fresh southwesterlies predominating. The day started with persistent rain in the northwest, and mostly sunny conditions in the south, but with some showers developing through the morning here. The rain in the north decayed into showers by lunchtime, resulting in isolated showers across the length of the nation, although it remained dry for most. Through the afternoon a band of rain moved eastwards across the north of the UK. A low developed in the south west in the afternoon, bringing blustery conditions and rain, sometimes heavy, to the southwest, and this moved eastwards through the night.

Summary of the UK Weather for Sunday 26 March 2023

At midnight, a frontal system bringing a large band of heavy rain was focused across southwest England and Wales. There were further scattered showers across parts of the midlands. A cold front across southern Scotland led to rain in this area. Throughout the early hours, the large band of rain in the southwest moved northeastwards, leading to rain across large parts of the south, reaching eastern England by around 0400. Further north, scattered showers continued but conditions remained dry for many throughout. The band of rain lingered over the southeast through the morning, but decayed and moved east, moving away by mid-day. This left a dry although cloudy day for many, with some sunny spells. Showers remained in Scotland, these wintry in places and isolated showers occurred along the east coast of England through the day. These decreasing during the evening as high pressure moved in. Temperatures quickly dropping in the evening as much of the cloud cleared.

Summary of the UK Weather for Monday 27 March 2023

At midnight, high pressure dominated off the northwest coast of Scotland, with a pressure ridge extending the length of the mainland UK. A few light showers affected parts of northeast, with some wintry over highest ground. These quickly dissipated through the early hours, although it remained a cloudy start for many, particularly the southwest where temperatures were much milder in comparison to the north. A weak occlusion brought scattered showers to the southwest of England in the late morning. Trough features across Norwich and Suffolk and Dorset, Wiltshire and Hampshire also produced showers in these regions until early afternoon. Elsewhere, cloud lifted early on to give some lengthy sunny periods, especially in Northern Ireland, Scotland and northern England, offsetting the lower temperatures that accompanied a light northerly flow. A low pressure system to the north of the UK brought a band of moderate rain and sleet across Shetland in the evening, and over the rest of the country cloud thickened from the west.

Summary of the UK Weather for Tuesday 28 March 2023

Tuesday started largely dry but cloudy for the majority of the UK, with the exception of Northern Ireland, which was already experiencing heavy rainfall. The ridge of high pressure was slowly replaced by a low pressure system and associated fronts moving in from the west. This brought multiple bands of rain moving northeastwards across the nation, resulting in most of the west receiving precipitation totals by dawn. The east remained mostly dry by sunrise. The main band of rain continued to push eastwards throughout the day, clearing the east coast of England just before sunset and lingering into the evening in eastern Scotland where it then slowly dissipated. The heaviest rain was generally around midday across northern England before weakening slightly as it moved off into the North Sea. Strong winds were recorded along Irish Sea coasts. The west did see some drier conditions as the rain cleared, but it remained cloudy for most and drizzly for some here.

Summary of the UK Weather for Wednesday 29 March 2023

Wednesday started dry for many, with the odd isolated shower in northwestern England and Scotland. Generally it was cloudier in the west with some clear spells in the east, as a low pressure system over the Atlantic pushed towards the UK. Through the night the cloud thickened and the showers increased in frequency; towards dawn a narrow band of persistent rain moved eastwards across the far northwest. A more widespread band of lighter rain moved into the southwest at a similar time. Through the morning and afternoon, many areas were affected by several outbreaks of rain, with most of the country situated under extensive cloud cover. The driest conditions were in the far southeast of England. Another band of rain tracked northeastwards across the country through the afternoon, which saw locally heavy downpours in areas, primarily across western upslopes in the north. Into the evening and through the night, a swathe of showers approached from the southwest, with many heavy outbreaks affecting parts of Wales and southern England. Northern areas turned largely dry by midnight. Temperatures were mild overall.

Daily Weather Summary for Thursday 30 March 2023

This day's summary created 06/04/2023 03:03

Summary of the UK Weather for Thursday 30 March 2023

At midnight a band of rain was stretched across England, stretching from the north Midlands to the Scottish border. There were further scattered showers across parts of Scotland and the southwest, the latter building throughout the early hours. There were variable amounts of cloud across the country with most areas seeing some clear patches at times, the best of these in central southern England and northeast Scotland, where temperatures dropped further than most other areas. Through the morning, the large band of rain over the central belt cleared eastwards, and was shortly followed by further scattered showers. These were often brief but heavy at times, giving a chance for clearer spells to emerge for most through the day. This trend continued until early evening, where Storm Mathis made landfall across Cornwall, tracking eastwards and bringing very strong winds, severe gales and heavy rain across southern parts into the night. Despite this, temperatures were mild as we saw the warmest day of the year so far.

This day's summary created 07/04/2023 03:03

Summary of the UK Weather for Friday 31 March 2023

At midnight, the region of low pressure was situated northwest of Cornwall, and tracked eastwards through the early hours. This brought plenty of cloud across England, Wales, and Northern Ireland, while Scotland and the far north of England saw some occasional clear spells. Along with the cloud, much of these areas experienced rainfall through the night, with the southernmost areas experiencing the highest accumulations. Despite strong winds, and occasional gales along southern coasts, temperatures remained largely mild, with exception to much of Scotland, where temperatures could fall lower under clearer skies. The low pressure system continued to track eastwards across England throughout the day, with the south seeing the highest rainfall amounts. Scotland saw a few areas of showers with occasional hail but remained mostly dry with a few sunny spells. Cloud cover was overcast across the UK throughout most of the day. It remained windy across the south of England and Wales into the night, with persistent gusts along southern coasts, with the highest recorded gusts in the Isle of Wight.

North Atlantic and Europe analysis charts and satellite images at 1200 UTC

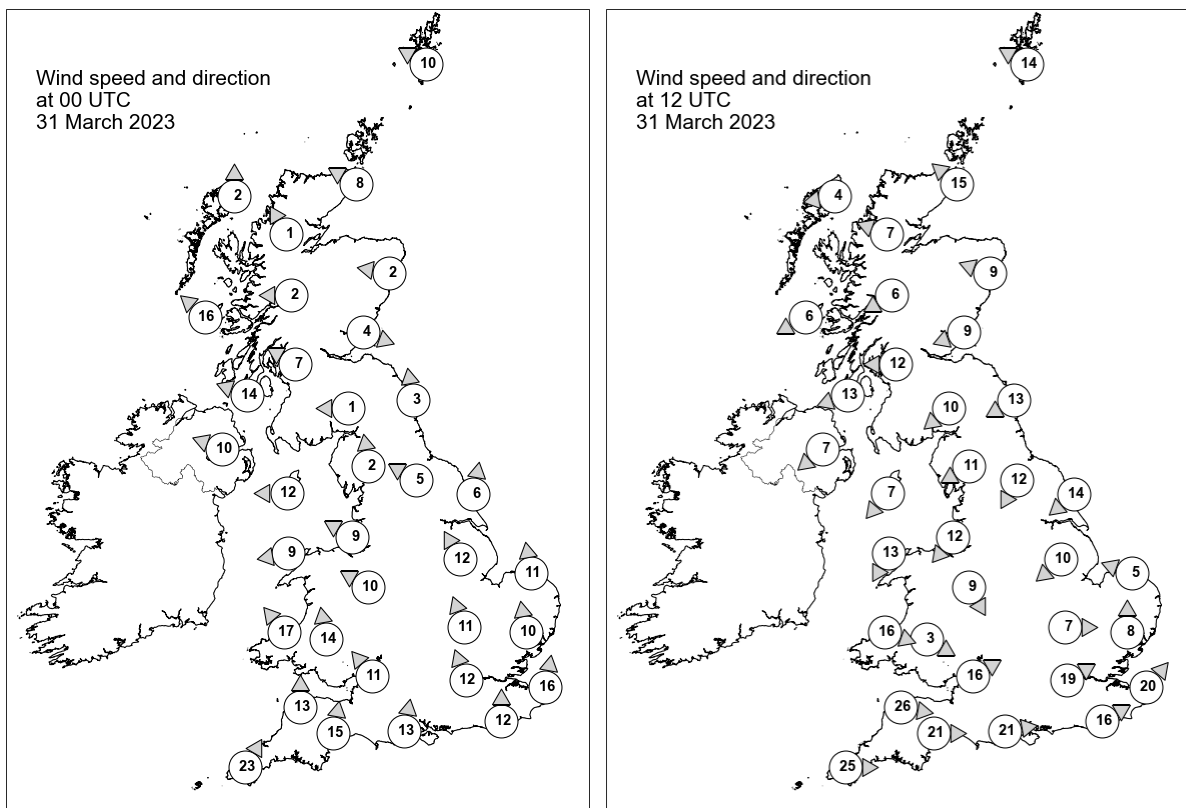

All satellite imagery copyright Met Office and EUMETSAT (European Organisation for the Exploitation of Meteorological Satellites). These show infra-red images from the geostationary MSG satellite. The rainfall rates are derived from both rain-radar and satellite data.

Daily Weather Summary for Friday 31 March 2023

Daily Weather Summary for Friday 31 March 2023

None of the selected stations observed a day of sleet or snow falling or non-zero snow depth at 0900 UTC.

Guidance Notes

UTC = Universal Coordinated Time. For the UK UTC is the same as GMT (Greenwich Mean Time).

National boundaries shown on the European station map are for illustrative purposes only.

Daily extremes

- Daily extremes have been manually confirmed by Met Office Observations Quality Management as valid observations from the live database at the time of checking. However, more extreme values may still be possible if they occur after the time of production.
- Mountain stations above 500 masl are excluded from lowest temperatures, highest gust speeds and greatest snow depths at 0900 UTC. This is because they are not considered representative of low level areas.
- Counties quoted against each station are based on historical county boundaries pre-1974 and may not reflect current administrative boundaries.

Analysis charts and satellite imagery

- The satellite imagery is infra-red imagery from the geostationary MSG satellite.
- The rainfall image is derived from satellite data from MSG and rain-radar data. This represents a snapshot of instantaneous rain-rates at 0000 UTC and 1200 UTC and so does not necessarily reflect daily accumulations in the rainfall station map.
- Any analysis charts or satellite images which are unavailable will be displayed as white space.

Station maps

- The UK maps show station data for the same set of stations presented UK data table. These stations are selected to provide good spatial coverage across the UK; they represent only a fraction of the overall UK observing network.
- Wind speed maps show wind speed in Kt and direction both averaged over the hour up to the time of observation. 1 Kt = 1.151 mph.

Hourly station data

- The data tables provide spot hourly observations from synoptic messages at 0000 and 1200 UTC. Missing data are denoted by '-'.

- Pressures are mean sea level pressure in hPa.
- For UK stations, Gibraltar and Jersey, the wind speeds and directions are both averaged over the hour up to the time of observation. However, for European stations wind speeds and directions are both averaged over a 10-minute period up to the time of observation.
- Wind speeds are in Kt. Wind directions are stored in the database every 10 degrees and have been converted to the nearest point of the compass. These give the direction the wind is blowing from, not to.
- Cloud amounts are in Oktas from 0 (clear) to 8 (overcast). 9 indicates sky obscured (eg by fog).
- Air temperature and dew point temperature are in Celsius.

Temperature maps

- Daily maximum, minimum and grass minimum temperatures are in Celsius.
- The period for the daily maximum temperature is defined from 0900 UTC on the day in question to 0900 UTC the following day.
- The period for the daily minimum and grass minimum temperatures is defined as 0900 UTC the previous day to 0900 UTC on the day in question.
- On any given day the minimum will typically occur in the early hours of the morning and the maximum in early afternoon.

Rainfall, sunshine and max gust speed maps

- Daily rainfall is in mm from 0900 UTC on the day in question to 0900 UTC the following day.
- Daily sunshine is in hours from Kipp and Zonen CSD1 automatic sunshine records. Bright sunshine is defined as exceeding 120 W/m².
- Max gust speeds are the daily max gust in Kt from 0000-0000 UTC

Snow maps

- The day of snow falling map displays data from present weather sensors, showing stations which have recorded sleet or snow falling at any point in the day (0000-0000 UTC).
- The snow lying map shows level snow depth as recorded by the automatic snow depth sensors at 0900 UTC. These snow depth sensors do not record snow depth if this is less than 1cm.
- Snow depth sensors are normally operational from October to April, in the event of snow falling outside this period data availability may be limited.

- Snow maps will only be displayed if one or more of the selected stations on that date have recorded either snow falling or non-zero snow depths. If snow maps are not displayed it is still possible that other stations in the network have recorded a day of sleet or snow falling or non-zero snow depth.
