METEOROLOGICAL OBSERVATIONS IN THE SOUTH ATLANTIC, AT OCEAN ISLAND AND IN BRITISH SOMALILAND DURING THE SECOND INTER- NATIONAL POLAR YEAR, 1932-3.

INTRODUCTION

In many of the problems of meteorology advance is only possible by international collaboration, and this is especially so in those problems in which investigations in the polar regions play an important part. This was first recognised by Lieut. Karl Weyprecht, who in an address which he gave in 1875 attributed the paucity of the scientific results previously obtained by polar expeditions to their isolated character. He proposed that expeditions should be arranged on a uniform plan to give simultaneous observations over a complete year at a number of places in high latitudes. This proposal resulted in the organization of the First International Polar Year from August 1, 1882 to August 31, 1883, in which fourteen expeditions representing eleven countries took part, twelve in high northern latitudes and two in high southern latitudes.

In 1928 proposals were made for celebrating the jubilee of the first Polar Year by organising a Second International Polar Year in 1932-3. In the interval however the requirements of meteorology had changed, and it was agreed that the main object of the meteorological work of the Polar Year should be the study of the circulation of the atmosphere between polar regions and lower latitudes. For that purpose corresponding observations were required from middle and lower latitudes, and the International Commission for the Polar Year expressed the opinion that the stations for which data are published in the *Réseau Mondial* would form a suitable network for this purpose, and that the daily observations made at these stations should be published *in extenso*.

The Governments of several British Colonies have given expression to this desire by publishing *in extenso* the observations obtained at stations within their area. Among these may be mentioned Nigeria, Bermuda, Fiji and British Guiana. The stations reporting to the British Meteorological Office, however, include several in isolated situations, especially small oceanic islands, which are of considerable importance for the study of the atmospheric circulation, and the observations for a selection of these stations for the Polar Year period August 1, 1932 to August 31, 1933, are given in full in the following pages. The stations are as follows :

Ascension Is.	Lat. 7° 55' S., Long. 14° 24' W.
St. Helena	Lat. 15° 57' S., Long. 5° 40' W.
South Georgia :				
Cumberland Bay	Lat. 54° 14' S., Long. 36° 33' W.
Leith Harbour	Lat. 54° 7' S., Long. 36° 42' W.
Stanley, Falkland Is.	Lat. 51° 42' S., Long. 57° 51' W.
Ocean Island	Lat. 0° 52' S., Long. 169° 35' E.
Berbera, British Somaliland	Lat. 10° 22' N., Long. 45° 2' E.

All these stations are included in the *Réseau Mondial*, with the exception of Leith Harbour, which is very near Cumberland Bay and for which only the barograms are reproduced.

The method of presenting the data follows as closely as practicable the recommendations of the Sub-Commission for Publications of the International Commission for the Polar Year. For each station is given : (i) a description of the site and surroundings, (ii) the daily observations at the fixed hours *in extenso*, (iii) reproductions of the records of certain autographic instruments or summaries of the tabulations. No upper air data are available.

Weather is reported in both the Beaufort notation and the international symbols. The following list gives the meanings of the letters and symbols employed :

b	Blue sky, whether with clear or hazy atmosphere.	≡	Ground fog, i.e., not exceeding the height of a man.
c	Cloudy, i.e., detached opening clouds.	∞	Haze. Range of visibility 1,100 yards or more, but less than 2,200 yards.
o	Overcast, i.e., whole sky covered with one impervious cloud.	∞ ⁰	Haze. Range of visibility more than 2,200 yards.
g	Gloom.	m	≡ ⁰ Mist. Range of visibility 1,100 yards or more, but less than 2,200 yards.
u	Ugly threatening sky.	§	Dust or sand-storm.
↗	Gale (force 8 or above).	v	Abnormal visibility.
q	Squalls.	e	Wet air, without rain falling.
r	● Rain.	w	Dew.
p	Passing showers.	◻	Hoar frost.
d	Drizzle.	☒	Snow lying, i.e., more than half the country in sight covered with snow.
*	Snow.	⊕	Solar halo.
※	Sleet. (Rain and snow together, or partially melted snow).	◻	Lunar corona.
△	Soft hail.	◻	Lunar halo.
▲	Hail.	○	Rainbow.
T	Thunder.		
↖	Lightning.		
tl	Thunderstorm.		
f	≡ Fog		
fe	≡; Wet fog		
	Range of visibility less than 1,100 yards.		

Capital letters denote great intensity. The suffix “⁰” indicates slight intensity. Repetition of letters denotes continuity. The prefix “i” denotes “occasional” or “intermittent.” For example :

r	Rain	●
R	Heavy rain	● ²
r ₀	Light rain	● ⁰
rr	Continuous rain	
ir	Intermittent rain	

The entry “tr” in the rainfall and cloud columns signifies “trace.” For rain this means less than 0.005 inch or 0.05 mm. When no rainfall or sunshine occurred on a particular day the entry appears as “...”. On occasions when no observation of any particular element was made the entry is “—”

In the tables of daily observations the highest maximum and lowest minimum temperatures are printed in heavy type ; at Berbera also the highest gust.

ASCENSION.

Latitude $7^{\circ} 56' S.$ Longitude $14^{\circ} 25' W.$

Height of rain-gauge above ground 1ft.

Height of station above M.S.L. 38ft. (11.6m).

Height of thermometers above ground 4ft.

Height of barometer cistern above M.S.L. 55ft. (16.8m).

Hours of observation :—9h. and 21h. local time. Self recording instruments :—

8h. 57m. and 20h. 57m. zone time. Sunshine recorder.

9h. 57m. and 21h. 57m. G.M.T.

All times in the tables of observations are local time, 3 min. fast on zone time.

Ascension is a small island in the South Atlantic Ocean having a total area of 34 square miles. The surface is very rugged and irregular, rising in the south-east to a height of 2,817ft. at the summit of Green Mountain. The south-east trade wind blows all the year round but with greatest force from June to August.

The meteorological station is at Georgetown on the north-west or leeward coast of the island and is situated on a coastal plain of volcanic material at a little distance from the beach. The instrument enclosure is covered with long grass; the site slopes gently towards the east. The station is under the care of the Superintendent of the Eastern Telegraph Company at Ascension.

The maximum and minimum thermometers are read and set at 21h. the values being entered to the day of reading.

Rainfall is measured soon after each fall owing to the heat and dryness of the air and the observations are allocated to one of the twelve-hour periods 9h. to 21h. or 21h. to 9h.

The sunshine recorder is mounted on the roof of a building. The horizon is interrupted by hills to the south and west, but the sun is never hidden by high ground when its altitude is above 5 degrees.

The visibility observations are taken from Green Mountain.

August, 1932.

Ascension Island.

SAINT HELENA.

Latitude $15^{\circ} 57' S.$ Longitude $5^{\circ} 40' W.$

Height of station above M.S.L. 1,905ft (581m.)

Height of barometer cistern above M.S.L. 1,900ft. (579m.)

Hour of observation :—6h. 30m. local time.

6h. 53m. zone time and G.M.T.

Local time is used throughout in the tables of observations and in the reproductions and tabulations of the autographic records.

St. Helena is an isolated island in the South Atlantic Ocean 1,200 miles distant from the west coast of Africa. The island has an area of about 47 square miles and lies in the path of the south-east trade wind throughout the year.

The station is at Hutt's Gate in the centre of the island. It is situated on the rising ground of a north-east spur of the semi-circular range of mountains which extends over the central part of the island. Immediately to the westward the ground rises to a height of 2,200ft. Diana's Peak, the highest point in the range and rising to 2,700 ft., lies to the southward at a distance of somewhat under a mile.

The thermometer screen and the rain gauge are exposed on a grass-covered enclosure on sloping ground. The maximum thermometer is read and set at 6h. 30m. local time and entered to the previous day and the minimum thermometer is read and set at 6h. 30m. and entered to the day of reading. The anemometer is erected on a hill at a little distance to the north-west of the instrument enclosure.

The thermograms and hygograms from October 3, 1932 to September 3, 1933 are reproduced in Plates I to VI. No records were obtained for August and September, 1932.

The words "fine" and "fair" in the "Remarks" column of the daily observations are used in the general sense and refer to the weather as a whole and not to the state of the sky in particular.

The definitions of F and f in the weather columns are not those in general use, and sometimes coincide with reports of fairly good visibility.

St. Helena.

August, 1932.

CUMBERLAND BAY, SOUTH GEORGIA.

Latitude $54^{\circ} 10' S.$ Longitude $36^{\circ} 30' W.$

Height of rain-gauge above ground 4ft.

Height of station above M.S.L. 15ft. (4.5m.).

Height of thermometers above ground 5ft.

Height of barometer cistern above M.S.L. 13ft. (4m.).

Height of anemometer above ground 24ft.

Hours of observation :—8h., 14h., 20h., local time.

8h. 26m., 14h. 26m., 20h. 26m., zone time.

10h. 26m., 16h. 26m., 22h. 26m., G.M.T.

All times in the tables of observations are in local time.

The island of South Georgia lies in the South Atlantic Ocean 1,150 miles east of Cape Horn and has an area of about 1,600 square miles. It is a mountainous island, with snow-covered peaks rising to heights of 6,000 to 8,000ft. separated by deep gorges filled by glaciers. The west and north-west coasts are exposed to strong westerly winds and are washed by the ice-bearing current from the Southern Ocean. The western side of South Georgia is snow-covered throughout the year, the snow-line lying at only 2,000 ft. On the north-east side the otherwise severe climate is tempered by the presence of a warm Föhn wind which sweeps down from the mountains and so prevents the accumulation of snow even in winter.

Cumberland Bay, South Georgia.

The meteorological station at Grytviken, Cumberland Bay, is situated at the entrance to King Edward Cove on the north-eastern side of the island. Mountains surround the site except on the south side which is open to the sea. The thermometer screen and the rain-gauge are situated about 20 and 13 yds. respectively from the shore.

The maximum thermometer is read and set at 20h. local time. The minimum thermometer is read at 8h. and set at 20h. Both values are entered to the day of reading.

LEITH HARBOUR, SOUTH GEORGIA.

Latitude 54° 7' S. Longitude 36° 42' W.

Self-recording instruments :

Height of station above M.S.L. 7ft. (2·1m.)

Large Richard barograph.

The times refer to local time, 2 hours 27 min. slow on G.M.T.

The meteorological station at Leith Harbour (Stromness Bay) lies 13 miles to the north-west of the station at Grytviken (Cumberland Bay) and the surrounding country and aspect are similar.

The barograms from August 1, 1932 to September 3, 1933 are reproduced in Plates VII to XI.

August, 1932.

STANLEY, FALKLAND ISLANDS

Latitude $51^{\circ} 42' S.$ Longitude $57^{\circ} 51' W.$

Height of rain-gauge above ground 1ft.

Height of station above M.S.L. 6ft. (1·8m.).

Height of thermometers above ground 5ft.

Height of barometer cistern above M.S.L. 6ft. (1·8m.)

Height of anemometer above ground 31ft.

Hours of observation :—9h. 8m. local time.

Self-recording instruments :—

9h. zone time.

Barograph.

13h. G.M.T.

Sunshine recorder.

All times in tables of observations and barograms are in zone time.

The Falkland Islands lie in the South Atlantic Ocean, 250 miles east of the south-eastern extremity of South America; they consist of a group of islands with a total area of 6,500 square miles, but only two, East and West Falkland are of any considerable size. Both islands are mountainous, rising to 2,300ft. and the surface is largely covered by peat bogs and numerous small lakes.

The meteorological station is at Port Stanley on the north-east coast of East Falkland. The site is a grass enclosure on the south side of Stanley Harbour and is bounded on the north and west by the sea water of the harbour and on the south and east by scattered houses, the nearest being 17yds. to the east.

The Stevenson screen and the rain-gauge are in central positions in the instrument enclosure. The maximum and minimum thermometers are read and set at 9h. and entered to the day of reading.

The wind force is obtained from the dial readings of a Robinson cup anemometer which is erected on a concrete block on the western side of the instrument enclosure and placed clear to the wind from all points of the compass. The height of the cups is 31ft. above the ground and 36ft. above M.S.L.

The barograms from August 1, 1932 to September 3, 1933 are reproduced in Plates XII to XV.

Stanley.

August, 1932.

OCEAN ISLAND.

Latitude $0^{\circ} 52' S.$ Longitude $169^{\circ} 35' E.$

Height of rain-gauge above ground 1ft.

Height of station above M.S.L. 134ft. (40.8m.).

Height of thermometers above ground 4ft. 1in.

Height of barometer western above M.S.L. 139.8ft. (42.6m.). to 4ft. 9in.

Hours of observation:—

Self recording instruments:—

8h., 18m., 2oh., 18m., local time.

Rain-gauge (natural siphon).

8h., 2oh., zone time.

Sunshine recorder (tropical pattern).

21h. (preceding day), 9h. G.M.T.

Zone time is used in the tables of observations and tabulations of the autographic records.

Ocean Island is situated in the western Pacific Ocean, about 260 miles west of the Gilbert Islands, and has an area of approximately 10 square miles. Cliffs from 20 to 30ft. high surround the island, except for a portion along the south-west coast, and the ground rises fairly regularly to a central plateau which is about 265ft. high.

The site of the meteorological station is in a fairly open space surrounded by well wooded country, with the ground sloping to the south. The station is in the charge of the British Phosphate Commissioners.

The maximum thermometer is set at 8h. and read at 2oh. and entered to the day of reading. The minimum thermometer is read and set at 8h. and entered to the same day.

Tabulations of the autographic rainfall records from October 1, 1932 to August 31, 1933 are given in the tables on pp. 48-9. No records were obtained for August and September, 1932.

Ocean Island.

August, 1932.

BERBERA, BRITISH SOMALILAND.

Latitude $10^{\circ} 26' N.$ Longitude $45^{\circ} 2' E.$

Height of rain-gauge above ground 2ft.

Height of station above M.S.L. 26ft. (7·8m.)

Height of thermometers above ground 5ft.

Height of barometer cistern above M.S.L. 45ft. (13·8m.) Height of anemometer above ground 88ft.

Hours of observation :—8h., 14h., 20h. local time and Self recording instruments :—

zone time.

Sunshine recorder.

5h., 11h., 17h. G.M.T.

Anemometer—pressure tube, direction

All times are in local time which is identical with zone time.

and velocity.

Berbera lies on the southern shore of the Gulf of Aden on a narrow strip of land between the sea to the north and the mountains of British Somaliland which reach a height of about 5,000 or 6,000ft. at a distance of some 50 miles south of Berbera. The coast line at Berbera runs approximately east-north-east and west-south-west, but the mountain range lies almost east and west from Cape Ras Hafun on the east to the Abyssinian mountains on the west.

Berbera.

17th, \overline{R} during evening; 19th, whirlwind at 6h. 30m.

Berbera is subject to the NE. monsoon between October and May, while from June to September the SW. monsoon prevails. The climate is intensely hot and the atmosphere very dry, especially during the SW. monsoon and there is very little cloud. During the hot season gales of sand-laden winds are prevalent, particularly in the forenoon.

The meteorological station is maintained at Berbera hospital which is situated to the south of the town on the coastal plain and about 500yds. from the shore. The sunshine recorder and the anemometer are exposed on the roof of the hospital. The vane of the anemometer is 88ft. above the ground and 30ft. above the building. The enclosure containing the thermometer screen and the rain-gauge lies 40 yards. to the south-west of the hospital. The maximum thermometer is read and set at 8h. and entered to the previous day and the minimum thermometer is read and set at 8h. and entered to the day of reading.

The anemograms are not reproduced here, but a discussion of the results over the period May, 1931 to April, 1933 is given in:—London, Meteorological Office, Professional Notes No. 65. In the tables of observation the force on the Beaufort Scale is based on the mean speed of the wind as given by the anemometer over a period of ten minutes; the tables also give the mean speed for the day and the time, direction and velocity of the highest gust.

August, 1932.
