Daily Weather Summaries for January 2022

If you have any questions or feedback about this product or wish to obtain further data please contact the Met Office.

This document contains daily weather summaries for each day of January 2022. The Met Office National Meteorological Library and Archive holds a continuous record of daily weather summaries or daily weather reports from 1860, and these daily weather summaries form a continuation of that series.

The purpose of each summary is to provide an overview of the weather conditions across the UK on that day, with the historical emphasis mainly based on observations from surface network of weather stations, although the format has varied over the decades. While the emphasis remains on observations from the surface network, the current daily weather summaries supplement these by including satellite and rain-radar imagery to provide a more complete overview. The current format of the daily weather summaries is as follows:

1. Text summary of the main characteristics of the weather during the day, written by an operational meteorologist in the Met Office operations centre.
2. Table of daily extremes for the UK for key climate variables including temperature, rainfall, sunshine and gust speeds.
3. Overview of the synoptic situation at 00 and 12 UTC comprising: analysis charts showing the surface pressure pattern and associated weather fronts; North Atlantic and European infra-red satellite images showing cloud-cover; combined infra-red and rain-radar images of the UK; maps of wind speed and direction at 00 and 12 UTC; observations of pressure, wind speed and direction, cloud cover, air and dewpoint temperature at selected UK and European stations in data tables.
4. UK maps of key climate variables from observing stations including maximum, minimum and grass minimum temperature, rainfall, sunshine, gust speed and snow.
5. Further guidance notes

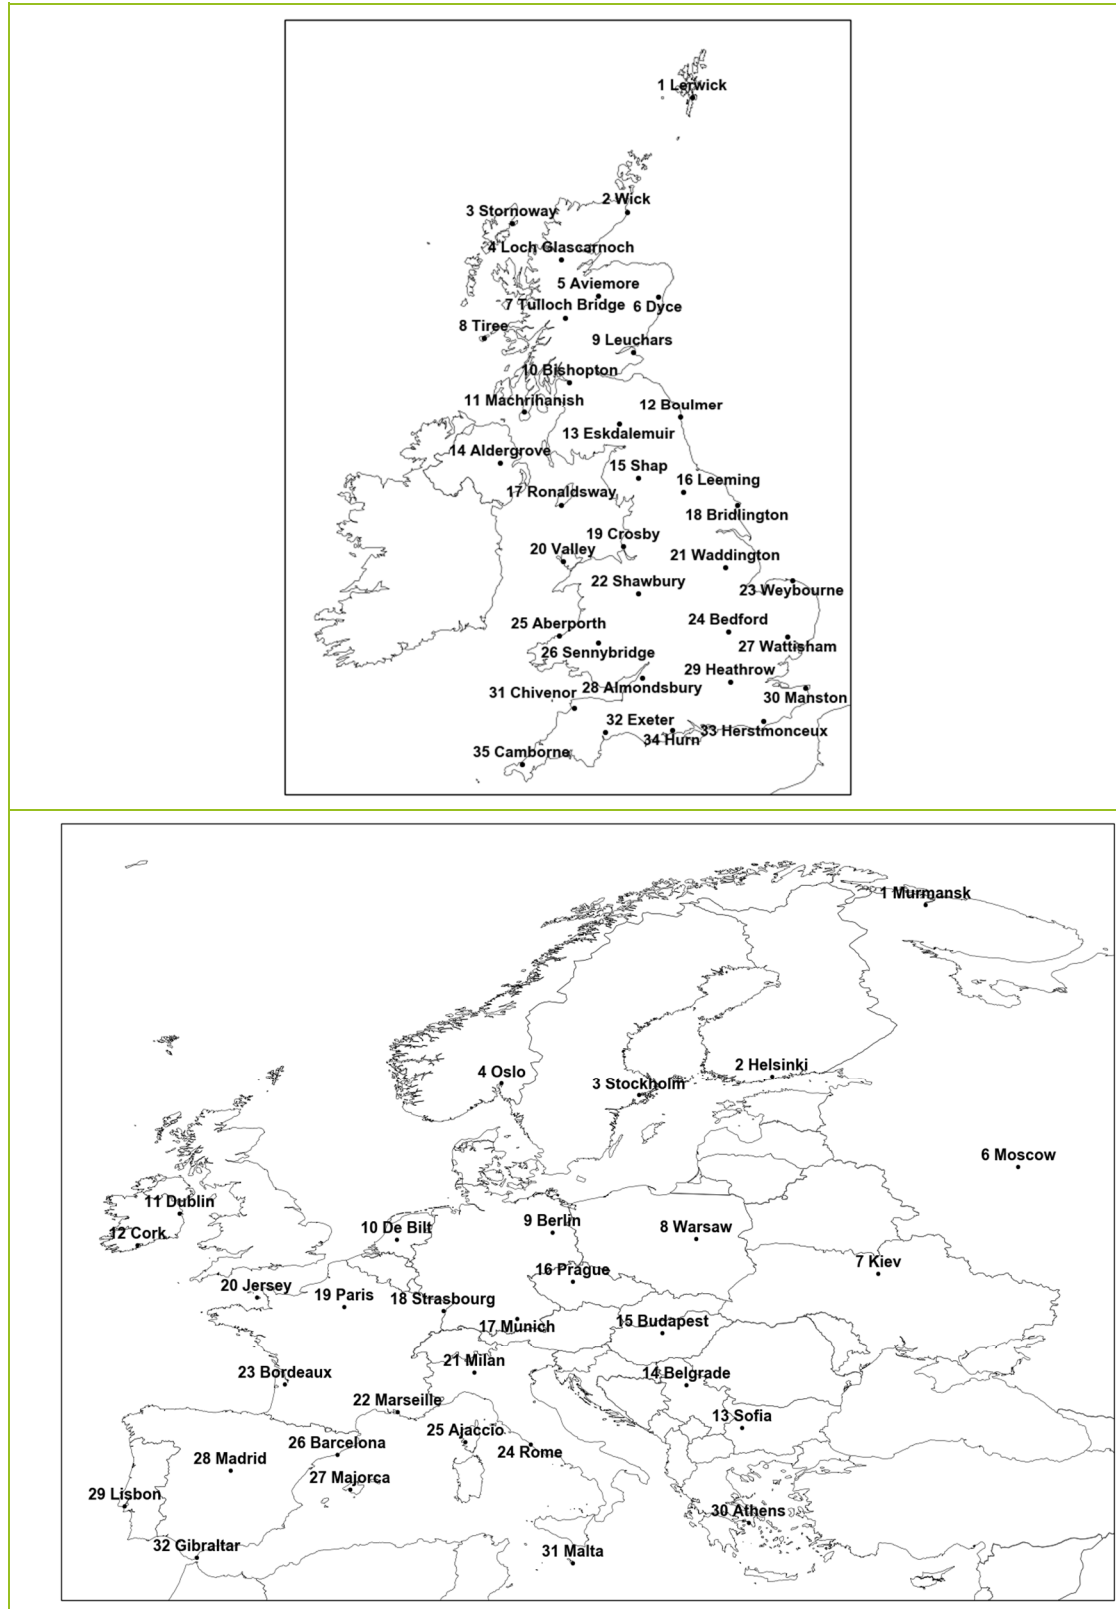

If you spot any data errors or omissions in this product please contact the Met Office.

Daily Weather Summary for Saturday 01 January 2022

This day's summary created 08/01/2022 03:03

Summary of the UK Weather for Saturday 01 January 2022

A cloudy and wet start to the new year for many with cloud covering much of the country through the early hours. Rain mainly affected Scotland with heavy bursts mainly affecting the northwest. This band of rain moved northeastwards during the morning. Winds were strongest across the north and west with coastal gales. Although it was not as mild as previous days in the north, it remained mild across the south of the UK. With a low pressure centre remaining to the northwest of the UK, cloudy and windy conditions dominated through the rest of the day. Frontal systems continued to bring some wet weather locally to areas across western Scotland through the afternoon. For locations elsewhere, the latter part of the day was dry and mild, however the day closed with a hint of rain creeping into the southeast of England. The New Year's Day maximum temperature record for the UK was broken too.

This day's summary created 09/01/2022 03:03

Summary of the UK Weather for Sunday 02 January 2022

Through the early hours of the morning, there were a few distinct zones of weather. Firstly, a cold front was lingering across the southeast bringing light rain. This was due to a developing wave, which slowed its progress. Secondly, an active trough crossed Wales and then England, clearing the east coast by dawn. There was some line convection embedded within this, bringing heavy rain and gusty winds across the Midlands. Thirdly, heavy showers affected western Scotland. Elsewhere, there were clear spells on what was another mild night for most. Rain in eastern England cleared through the morning leaving sunny spells, although southern and western areas were cloudier. Another trough moved eastwards, reaching Cornwall and west Wales by midmorning, bringing strong winds and heavy rain, followed by sunshine and showers. Northern Ireland saw widespread, heavy showers through the day, whilst western Scotland had rain which was heavy at times, turning more scattered as it moved east. It was windy, particularly in coastal locations, and whilst still mild, was cooler than previous days.

Summary of the UK Weather for Monday 03 January 2022

The new week started mild and unsettled. Through the early hours, there were some potent and blustery showers affecting the far southwest of England, and central west Wales, extending into the Midlands. Numerous lightning strikes were reported. The showers in the southwest became a more general area of rain, moving eastwards through the Channel by dawn. Frequent heavy showers affected Northern Ireland, and it was a wet night for central and western Scotland. Behind a cold front, colder air arrived into the Northern Isles, and northern Scotland by dawn. Throughout the morning, a band of showers moved southwest, gradually covering central parts of England, Wales and Ireland. More scattered showers also moved slowly southwestwards over Scotland from the northeast. Lightning strikes were experienced this morning in west Wales and some central parts. Winds remained strong towards northern parts, especially northern Scotland along coasts.

Summary of the UK Weather for Tuesday 04 January 2022

The cold front continued to move south across the country through the early night, bringing noticeably colder conditions. Rain also moved southwards, and continued through the morning. Ahead of the front conditions were generally cloudy with a few scattered showers, mostly in the west, while behind it clearer skies preceded showers, wintry at times at higher levels. Winds were strong in the north and along Irish Sea coasts. The cold front continued its course across central and southeastern England through the day. Occasionally, sleet or snow was observed along the rearward edge of this band as the temperatures dropped markedly behind the front. Elsewhere, there were bright spells for many whilst also rather breezy along coasts. Inland areas remained dry whilst a northerly feed of showers affected much of northwestern Scotland, Northern Ireland, and through the Irish Sea into Wales and far western parts of England. These showers were occasionally heavy, mainly in the north, where isolated thunderstorms developed. Showers also turned to snow at times over hills.

Summary of the UK Weather for Wednesday 05 January 2022

It was a clear night that remained dry for most, with only a few scattered showers over parts of northern Scotland, Wales and northwest England as an occlusion passed over eastern Scotland through the early hours. The precipitation over Scotland most likely fell as snow, especially over higher ground. Low cloud and fog persisted in some mountain areas, however this soon cleared by dawn. It was a largely dry and mild day for most of England southern Scotland, with many areas seeing large amounts of sunshine. Wales and the far north of Scotland were cloudy with some isolated showers, particularly over high ground. Northern Ireland didn't see much in the way of rain but was cloudy throughout the day. Most of the showers cleared as we moved into the night, a bank of cloud approached from the west and covered Scotland by midnight.

Summary of the UK Weather for Thursday 06 January 2022

It was a dry and cold night for all with temperatures below zero across the UK bringing frost and wintry conditions. As dawn approached, an occluded front moved in from the west, bringing large amounts of rain and sleet to Ireland and western Scotland, with higher ground experiencing hill snow. Winds remained light, however they began to strengthen with the oncoming westerly occlusion bringing blustery conditions. By noon, the occluded front had brought persistent rain and showers to the whole of the UK, excluding southeast England which had mostly clear skies throughout the morning. There was snowfall in the midlands and Scotland, particularly over higher ground. The occluded front moved to the east of the UK by the evening, with scattered showers following behind - mainly over northern England, northern Wales and southern Scotland. A second occluded front moved over the UK, bringing persistent showers to the northwestern coast late afternoon, moving over Scotland, Northern Ireland, Wales and northern England by evening.

Daily Weather Summary for Friday 07 January 2022

This day's summary created 14/01/2022 03:03

Summary of the UK Weather for Friday 07 January 2022

Two occluded fronts cleared the southeast tip of England just after midnight. A clear spell then followed for southeast England, whilst the rest of the country experienced cloudy conditions and some isolated showers, especially the southwest, Wales, Northern Ireland, and northern England. Scotland saw extensive cloud cover throughout the morning, as well as persistent rain particularly in the west. By dawn, the showers over Northern Ireland and the western coasts of Scotland, England and Wales were persistent, whereas London and southeast England had mostly clear skies. A cold air mass with an associated warm front travelled northeast towards the UK throughout the day, reaching the southeast by late morning. This front brought heavy rain, sleet and snow to most of Wales and southeast England, as well as thunder to western Scotland, northwestern England and southwestern England. The majority of this front remained south of the UK, producing a small area of dense precipitation that covered the southeast by mid-afternoon.

Summary of the UK Weather for Saturday 08 January 2022

It was a cloudy for all areas of the UK throughout the night, as a warm front moved in from the Atlantic bringing over a large bank of cloud. There was also large amounts rain, beginning in Northern Ireland, before spreading to Scotland and Wales, and eventually affecting most of the UK by dawn. It was fairly breezy in the west, but winds remained light in eastern areas. The minimum temperature was -4.3 degrees Celsius at Aboyne No 2, Aberdeenshire. Saturday was another unsettled day, although milder than Friday. A cold front cleared eastward through the day followed by showers. There was some torrential rain which affected Manchester and northwest England in the morning, with some poor road conditions. Another area of torrential rain affected southwest England, with quite a few lightning strikes. Some line convection developed on the cold front through the Midlands in the afternoon, with the associated gusty winds and heavy rain. Finally, some of the showers following the front were heavy with hail and thunder.

Summary of the UK Weather for Sunday 09 January 2022

Showers dominated the early weather, covering north and west of the UK. Some of these wintry over high ground, particularly in Scotland, with some icy patches forming in-between. Eastern UK experienced clear skies until dawn. Winds, particularly on the western coast, kept temperatures low throughout, with the exception of eastern Scotland, dipping below freezing. During the morning, showers continued affecting western UK, with clear skies elsewhere, especially southeastern UK, with another warm front slowly approaching from the Atlantic. Through the afternoon, the frontal cloud band slowly pushed northeastwards, bringing some rain to south Wales and southwest England. The morning showers pushed into northern England and parts of eastern England, while showery weather continued in Northern Ireland, southern Scotland and northern England. Southeastern UK remained dry throughout. Rain showers in Northern Ireland, southern Scotland, northern and eastern England faded during early evening, as clear spells developed for many, before fog patches formed in parts of Scotland and northeastern England. The frontal rain band continued slowly, bringing further light rain to western UK.

This day's summary created 17/01/2022 03:03

Summary of the UK Weather for Monday 10 January 2022

A warm front slowly travelled eastwards across the UK and brought persistent rain and showers. These began in southwest England and Northern Ireland, slowly moving over Wales, western Scotland and eastern England by dusk. Eastern UK experienced some clear skies at first with some patches of mist, winds were light, and temperatures were mostly above freezing, with the exception of eastern Scotland and far southeast England. Cloud quickly spilled in from the west in association with the warm front. A grey day followed with rain and drizzle as the warm front moved slowly across the UK. Southern regions saw plenty of drizzle through the afternoon whilst the west of Scotland had longer spells of rain as the cold front followed. This drizzle, low cloud and fog persisted into the evening whilst clearer weather developed in northern areas as the cold front pushed southwards, except for west Scotland which had continued showers and strong wind.

Summary of the UK Weather for Tuesday 11 January 2022

The slow pushing frontal system continued to dominate the weather and created a northwest-southeast split. Northern England and northwestern Scotland saw some outbreaks of rain and drizzle through the early hours, while many in the south experienced a mostly dry but misty and foggy night, and low cloud covered the southern UK up to Wales and the Midlands. Through the night, skies became clearer from the north as the fronts slowly sank southeast. Fog was slow to clear through the morning as some light rain and drizzle continued across the south. Most of the country remained dry through the afternoon once showers cleared southwards except for west Scotland which saw continued showers. Winds remained mostly calm. Areas of fog then began to reform as skies cleared into the evening with some rain and drizzle continuing in northwest Scotland.

Summary of the UK Weather for Wednesday 12 January 2022

High pressure to the west of UK dominated the weather with a north-south split, the northern UK remained windy and cloudy, while the southern UK experienced more settled conditions. Through the night, clear skies in the south led to widespread of frost and patches of fog forming across Wales and England, whereas the cloud was seen pushing southeastwards slowly. Overall it was a mostly dry night apart from the northwestern UK, where light rain was experienced. Fog was slow to clear in places with any remaining showers dying out through the morning. This left a dry and bright day for most across the UK with high pressure continuing to dominate bringing very settled conditions. Most experienced good sunny spells apart from parts of Scotland and far north England which was under a band of cloud through much of the day, accompanied by a few coastal showers in north Scotland. Winds remained light with temperatures staying rather cool for many.

Summary of the UK Weather for Thursday 13 January 2022

High pressure continued to dominate the synoptic situation leading to a widely dry start to Thursday. There were however some very isolated showers in the west of Scotland through the early hours. There was plenty of clear skies with calm winds, which kept temperatures cool and resulted in the formation of fog patches and a widespread frost. With early morning fog clearing it was a dry and bright day for most across the UK with high pressure continuing to dominate bringing very settled conditions. By midday any cloud lying over Scotland cleared to the east leaving bright conditions for all with the occasional light coastal shower across far north Scotland through the afternoon. Winds remained light with temperatures staying rather cool for many.

Summary of the UK Weather for Friday 14 January 2022

High pressure continued to drive somewhat benign conditions across the UK into Friday morning. The only rainfall to affect the UK was in the far north of Scotland through the early hours, where light showers formed along the coast. The rest of the UK had variable cloud amounts with some clearer spells seen in the southwest. Light winds and cold temperatures led to areas of mist and fog forming, most impactful around central and southern parts. A yellow weather warning for fog had been issued between 1700 Thursday and 1100 today. Fog was slow to clear across the south of the UK during the morning, while patches of fog continued to persist into the afternoon in the midlands. Cloud covered much of northern England, Northern Ireland and Scotland with some rain and drizzle reported in northern Scotland. Low cloud was reported along the Scottish coasts throughout most of the day. It remained largely clear across Wales and the south of England. Into the evening it remained relatively clear across the south of the UK resulting in frost and fog including freezing fog patches reforming.

Summary of the UK Weather for Saturday 15 January 2022

The morning started out clear for many areas apart from Scotland, Northern Ireland and southwest England. As the morning progressed, cloud cover increased throughout the country, with many areas experiencing thick fog, as well as some freezing fog in central and southern England, but the Northwest of England remained clear until dawn. There was very little precipitation, with small amount of rain occurring in the western isles of Scotland in the early hours. The thick fog across central, southern, and eastern England remained until late morning when it slowly lifted for most places although it continued to affect the East Midlands into the afternoon. It was rather cloudy for most of the country with a few clearer spells across northern England. It remained largely dry across the country however light rain affected Northern Ireland, and northern and southern Scotland. Into the evening some locally heavy showers affected the southwest and a band of rain reached northern Scotland and was moving southeast through the evening.

This day's summary created 23/01/2022 03:03

Summary of the UK Weather for Sunday 16 January 2022

A cold front slowly moved southeast across Scotland through the morning and brought a band of light rain, as well as some patchy rain across Wales and northern England. A small area of occasionally heavy rain moved across the southwest peninsula, but largely faded away by dawn. The rest of the country was largely cloudy with patchy fog affecting areas of southern England and Wales. Despite the cloudy conditions, there was the odd clear spell, particularly southeast England. Through the day, the cold front continued its journey southwards. This was associated with some patchy light rain, but this fizzled out by the afternoon. A further trough cleared the south coast in the morning, taking the showers away with it. Ahead of the cold front, there was an occlusion, which brought some patchy rain, particularly across southwest England. There were some good sunny spells through London and southeast England, and it was partly cloudy behind the cold front across northwest England. Winds were light in the south, but a little stronger elsewhere. Through the evening, it became clear for many.

Summary of the UK Weather for Monday 17 January 2022

It was a largely cloudy start to the week for most of the country with high pressure continuing to dominate the synoptic situation. This resulted in a dry start to the week for many. A cold front was positioned to the northeast of the UK and slowly moved south during the early hours remaining in the North Sea, whereas a decaying cold front sat to the south of the UK. It remained cloudier and windier in the north and fog was recorded in northwest England. Elsewhere saw some clear spells between the cloud breaks. The sunshine returned for many areas through the daytime, with some areas having cloudless skies. However, not everywhere was sunny, with persistent stratocumulus plaguing northwest England and the coasts of Scotland, particularly the west and north. It was a dry day for all. Winds were very light across England and Wales, but a little stronger across Scotland. Through the evening, temperatures fell sharply, and a widespread frost quickly formed away from Scotland and Northern Ireland, with fog starting to affect parts of England.

Summary of the UK Weather for Tuesday 18 January 2022

Clear skies under high pressure resulted in extensive fog across England and east Wales during the small hours. The rest of the country saw variable amounts of cloud and clear spells with the amount of high cloud increasing towards dawn for Scotland, Northern Ireland and Wales. It remained dry and it was a cold and frosty night, especially across the south of the UK. There was fog around for much of England and Wales through the morning, which had mostly cleared by midday. Large parts of the east had clear skies for a time, but it was cloudier in SW and N England, Northern Ireland and Scotland, with a band of frontal rain and stronger winds moving eastwards across Northern Ireland through the morning, and Scotland from midday, with some showers following. The frontal rain eased through the evening as it cleared, but heavy showers continued to affect the west and northwest of Scotland. Furthermore, fog started reforming under clearer skies in the south through the evening.

This day's summary created 26/01/2022 03:04

Summary of the UK Weather for Wednesday 19 January 2022

A weak occlusion, which stretched from SW England through the Midlands by dawn, brought some light rain to Wales through the small hours. Behind it there was a more active cold front, which brought some heavy rain to western Scotland. This had cleared from Scotland by dawn, leaving behind clear skies in southeast Scotland, and frequent showers in the northwest where it was windy. Further south, there were some good clear spells across the Midlands initially, but these filled in with cloud over time as the weather fronts approached. Some rain associated with these fronts was seen across southern England and the Midlands through the morning. Some isolated light showers continued throughout the afternoon, mainly in the southwest and Scotland, whilst central and northeastern areas experienced some longer clear spells. Scotland saw some wintry showers into the evening along with some gale force winds. Elsewhere remained mostly dry with clear spells as a frost began to develop into the night across much of England and Wales.

Summary of the UK Weather for Thursday 20 January 2022

The early hours of the morning were dry for the vast majority as high pressure reasserted itself to the west of the UK. However, there were a few light showers peppering the east coast of both Scotland and England, as well as northwest Scotland and Northern Ireland. Some very light showers also affected Wales. Elsewhere was mostly clear, and although it was chilly, the northerly breeze prevented temperatures falling too low in most areas, but there were a few isolated cold pockets. Continuing through the day, it was clear that the high pressure system was dominating the synoptic situation across the UK. A dry day ensued for most, with a range of temperatures being recorded due to a mix of clear skies and patchy cloud allowing for variation. Winds were slack for most, but stronger along the east coast of England. The occasional coastal shower brought a small amount of precipitation to far eastern areas of England and the very far north of Scotland. These residual coastal showers eased through the evening with clear skies again for most.

This day's summary created 28/01/2022 03:03

Summary of the UK Weather for Friday 21 January 2022

High pressure continued to be the dominant theme, with a dry and clear night for most. Light showers or drizzle cleared East Anglia, and affected the northwest coast of Scotland and Northern Ireland, where the cloud cover remained through the early morning. Cloud moved eastwards from the west coast through the morning, mainly affecting the northwest, northern Wales and the west coast of Scotland. It was a cold night under the clear skies, with temperatures lower in the south and east than in the north. The day continued to be rather benign, with mostly dry and cloudy conditions across the UK. There was more cloud than recent days, particularly across the midlands, Wales and the northwest of England. Elsewhere saw plenty of good spells of sunshine in addition to light winds. The mountains of western Scotland received a touch of drizzle through the day, which continued into the evening. Most areas remained cloudy during the evening, except for the odd cloud break across southern and eastern locations, where local frost could form.

Summary of the UK Weather for Saturday 22 January 2022

The early morning was cloudy for many, with the best of any clear spells along the east coast. A cold front brought some light rain to the north and west coasts of Scotland. Temperatures were higher than of late due to the extensive cloud cover, but it remained a cold night, with temperatures generally higher in the north than the south. Winds were relatively light. Throughout the day, the cold front gradually moved southeastwards bringing further light showers to areas of Scotland and northwest England, reaching as far south as Manchester. Some parts of north Wales also received light showers. Elsewhere, further south remained dry with variable amounts of cloud with few breaks. Temperatures remained milder in the north than in the south.

Summary of the UK Weather for Sunday 23 January 2022

With the high pressure centre remaining situated across the UK, conditions were settled heading into Sunday. A rather benign start to the day, it was cloudy for most with light winds across England and Wales, and stronger winds across Northern Ireland and Scotland. This cloud cover allowed for mild weather, with most areas warmer than average for this time of the year. The UK remained dry throughout the rest of the morning and through the afternoon with cloud covering the country. Some isolated clearer spots developed through the afternoon in the southwest. Winds remained calm throughout and temperatures felt colder throughout the day. Cloud remained into the evening although some breaks in the southwest. Some rain arrived into northern Scotland which was briefly heavy.

Summary of the UK Weather for Monday 24 January 2022

High pressure that recently dominated the UK, moved southeastwards. As this centre now resided over continental Europe, unsettled conditions were welcomed. It was a dry start for most, with showers for areas of western Scotland. A cold front loomed north of Scotland, however with the addition of westerly winds here, this front didn't make any progress inland during the small hours. With the insulating cloud cover, it was a mild night for most. Into the day, the fronts continued to linger over northern Scotland, bringing further rain, breaking up the cloud, whereas England and Wales remained dry and cloudy. The fronts stayed in northern Scotland through the day as the high pressure prevented them pushing southwards, as a result the far north experienced a persistent rainy day, elsewhere saw a brighter day with clear spells. In the south, skies remained cloudy with light winds. Into the evening, most areas remained dry and cloudy, apart from further rain and cloud breaks in Scotland.

Summary of the UK Weather for Tuesday 25 January 2022

As high pressure continued to dominate, the night remained dry for most, other than some parts of northwest Scotland which received light rainfall. Additionally, some areas of The Pennines experienced light drizzle at times with fog experienced through the early hours. Cloud covered the whole of the British Isles, however there were few breaks in parts of west Wales and northeastern areas. Temperatures remained mild in the north and cooler in the south. Through the morning, fronts to the north of the UK pushed into northwestern Scotland, bringing further rainfall to the far north. Most of the UK remained overcast and dry, and some inland areas saw haze, mist and fog patches, particularly Leeds and Bradford where freezing fog was seen. During the afternoon, the cold front continued to push southeastwards, with the light rain spreading to northeastern Scotland. The cloud broke slightly behind the front in parts of Scotland, although conditions were still generally cloudy. Into the evening, while southern UK remained mostly dry, the drizzle in Scotland and Northern Ireland extended to northern parts of England and Wales.

Summary of the UK Weather for Wednesday 26 January 2022

High pressure dominated the weather through the night right across the UK, accompanied by a weak occluded front which remained relatively stationary over Scotland. Conditions remain dry and cloudy for most, with some scattered showers in western Scotland. A thicker band of cloud pushed southwards from Scotland across the English border in the early hours. There were a few breaks in the cloud across Northern Ireland and the far southwest, but predominantly cloudy throughout. Temperatures remained mild in the north and cooler in the south. An occluded front travelled southeast towards the UK throughout the morning, reaching northern Scotland by the afternoon, bringing a heavy band of rain, and scattered showers to central Scotland and Northern Ireland. Elsewhere remained dry but cloudy throughout. Towards the evening, those frontal scattered showers reached northern England. Overall a mild day, with cooler temperatures in the south.

This day's summary created 03/02/2022 12:40

Summary of the UK Weather for Thursday 27 January 2022

A weak low pressure system dominated the weather through much of early hours which pushed southeastward, bringing a mixture of conditions across the UK. Scotland, northern England, Wales and Northern Ireland experienced some drizzle and scattered showers, some locally heavy across Scotland and Wales. The south of England experienced dry conditions throughout with a band of frontal cloud reaching the south coast by dawn. Strong gusty winds associated with the frontal system were experienced in northern Scotland. Some cloud breaks led to a drop in temperatures in some locations. As the frontal system progressed over the UK, the scattered showers and drizzle spread inland, reaching the Midlands, southwest England and London by noon, with Scotland continuing to experience heavier showers. A lingering cold front cleared the south of the UK in the afternoon, bringing dry conditions and patches of clear skies to southern England and Wales. The remaining showers on the west coast of the UK and Scotland eased, becoming lighter and isolated into the evening. Overall, a mild day.

Summary of the UK Weather for Friday 28 January 2022

High pressure took charge of the UK's weather again in the early hours and dominated the weather in England and Wales, as most saw a dry calm night with some clear skies and patches of mist and fog formed widely across Wales and England. Whereas the northern UK, Northern Ireland and Scotland's weather were more influenced by the low pressure system at the north of UK, with overall cloudier and windier conditions, and an occluded front. This front also brought some rainfall to far northwestern Scotland before dawn. It was a cold night with temperatures reaching below freezing in multiple regions, including the southern areas. Frontal rain continued across the north of Scotland through the morning before heading eastward through the afternoon. Plenty of dry weather was seen across England and Wales, although showers were frequent across the midlands. Some areas, particularly in the southwest, saw some prolonged clearer spells. Winds increased into the evening, especially in the north, where gale force winds developed into the night.

Summary of the UK Weather for Saturday 29 January 2022

The southwest, southern Wales, western UK and Northern Ireland experienced showers through the early hours, while northwestern Scotland experienced rain, heavy in places. Temperatures were mild as the UK remains in a warm sector behind a warm front to the north of the UK. Winds increased as Storm Malik edges closer from the west, particularly in Scotland, where the gusts reached 61 mph. Strong winds continued into the afternoon with the most impactful gusts seen across parts of Scotland and the north of England where gusts exceeded 80mph. Rain in the northwest moved south bringing showers across the midlands and Wales, although this eased through the afternoon leaving some brighter skies. Winds eased into the late afternoon as storm Malik progressed eastward away from the UK. Clear spells developed into the night, which coupled with lighter winds, lead to a widespread frost.

Summary of the UK Weather for Sunday 30 January 2022

The beginnings of storm Corrie brought scattered showers to the west of the UK through the early hours, before heavy precipitation reached northwestern Scotland at dawn, meanwhile the west had mostly clear skies. It was a cooler night than previous days, with the warmest temperatures in the southwest. Throughout the day, storm Corrie brought severe gales to western Scotland, these intensified into the afternoon. These were accompanied by rain over northern Scotland, hitting west coasts first before moving east/southeastwards by evening, though sometimes wintry over higher ground. Elsewhere, Corrie brought light rain over Wales, with some heavier patches over parts of Northern Ireland and northwest England. It remained dry, bright and clear elsewhere, mainly in southern and southeastern areas. The southwest also remained dry and bright with some patchy cloud cover in far western parts.

Summary of the UK Weather for Monday 31 January 2022

An unsettled and very windy start to the week as storm Corrie tracked eastward across the north of the UK. Gusts of up to 80mph were seen across the north through the early hours, accompanied by heavy rain. Showers were also frequent across midland and southern areas, although they eased towards sunrise where some clearer spells were seen. By this time the main low pressure system associated with the storm had tracked eastward leaving more settled conditions, although a gusty breeze remained. Throughout the day, Corrie trailed off eastwards, bringing the windiest conditions to the North Sea and eastern coasts of the UK. Still, strong winds continued, however these were less severe than throughout the night and early hours. Morning scattered showers tracked over western Scotland, Northern Ireland and western parts of England and Wales before a frontal system of lower pressure brought heavy rain to these parts by mid-afternoon. Elsewhere remained dry and clear, especially in the southeast, with temperatures feeling lower due to wind-chill. Patchy cloud soon covered the southeast by late afternoon, though remained dry here.

Daily Weather Summary for Monday 31 January 2022

Daily Weather Summary for Monday 31 January 2022

Guidance Notes

UTC = Universal Coordinated Time. For the UK UTC is the same as GMT (Greenwich Mean Time).

National boundaries shown on the European station map are for illustrative purposes only.

Daily extremes

- Daily extremes have been manually confirmed by Met Office Observations Quality Management as valid observations from the live database at the time of checking. However, more extreme values may still be possible if they occur after the time of production.
- Mountain stations above 500 masl are excluded from lowest temperatures, highest gust speeds and greatest snow depths at 0900 UTC. This is because they are not considered representative of low level areas.
- Counties quoted against each station are based on historical county boundaries pre-1974 and may not reflect current administrative boundaries.

Analysis charts and satellite imagery

- The satellite imagery is infra-red imagery from the geostationary MSG satellite.
- The rainfall image is derived from satellite data from MSG and rain-radar data. This represents a snapshot of instantaneous rain-rates at 0000 UTC and 1200 UTC and so does not necessarily reflect daily accumulations in the rainfall station map.
- Any analysis charts or satellite images which are unavailable will be displayed as white space.

Station maps

- The UK maps show station data for the same set of stations presented UK data table. These stations are selected to provide good spatial coverage across the UK; they represent only a fraction of the overall UK observing network.
- Wind speed maps show wind speed in Kt and direction both averaged over the hour up to the time of observation. 1 Kt = 1.151 mph.

Hourly station data

- The data tables provide spot hourly observations from synoptic messages at 0000 and 1200 UTC. Missing data are denoted by '-'.

- Pressures are mean sea level pressure in hPa.
- For UK stations, Gibraltar and Jersey, the wind speeds and directions are both averaged over the hour up to the time of observation. However, for European stations wind speeds and directions are both averaged over a 10-minute period up to the time of observation.
- Wind speeds are in Kt. Wind directions are stored in the database every 10 degrees and have been converted to the nearest point of the compass. These give the direction the wind is blowing from, not to.
- Cloud amounts are in Oktas from 0 (clear) to 8 (overcast). 9 indicates sky obscured (eg by fog).
- Air temperature and dew point temperature are in Celsius.

Temperature maps

- Daily maximum, minimum and grass minimum temperatures are in Celsius.
- The period for the daily maximum temperature on day D is defined from 0900 UTC day D to 0900 UTC day D+1.
- The period for the daily minimum and grass minimum temperatures on day D is defined as 0900 UTC day D-1 to 0900 UTC day D.
- On any given day D the minimum will typically occur in the early hours of the morning and the maximum in early afternoon.

Rainfall, sunshine and max gust speed maps

- Daily rainfall is in mm from 0900 UTC day D to 0900 UTC day D+1.
- Daily sunshine is in hours from Kipp and Zonen CSD1 automatic sunshine records. Bright sunshine is defined as exceeding 120 W/m².
- Max gust speeds are the daily max gust in Kt from 0000-0000 UTC

Snow maps

- The day of snow falling map displays data from present weather sensors, showing stations which have recorded sleet or snow falling at any point in the day (0000-0000 UTC).
- The snow lying map shows level snow depth as recorded by the automatic snow depth sensors at 0900 UTC. These snow depth sensors do not record snow depth if this is less than 1cm.
- Snow depth sensors are normally operational from October to April, in the event of snow falling outside this period data availability may be limited.
- Snow maps will only be displayed if one or more of the selected stations on that date have recorded either snow falling or non-zero snow depths. If snow maps are not

displayed it is still possible that other stations in the network have recorded a day of sleet or snow falling or non-zero snow depth.
