## Daily Weather Summaries for October 2023

**If you have any questions or feedback about this product or wish to obtain further data please contact the Met Office.**

This document contains daily weather summaries for each day of October 2023. The Met Office National Meteorological Library and Archive holds a continuous record of daily weather summaries or daily weather reports from 1860, and these daily weather summaries form a continuation of that series.

The purpose of each summary is to provide an overview of the weather conditions across the UK on that day, with the historical emphasis mainly based on observations from surface network of weather stations, although the format has varied over the decades. While the emphasis remains on observations from the surface network, the current daily weather summaries supplement these by including satellite and rain-radar imagery to provide a more complete overview. The current format of the daily weather summaries is as follows:

1. Text summary of the main characteristics of the weather during the day, written by an operational meteorologist in the Met Office operations centre.
2. Table of daily extremes for the UK for key climate variables including temperature, rainfall, sunshine and gust speeds.
3. Overview of the synoptic situation at 00 and 12 UTC comprising: analysis charts showing the surface pressure pattern and associated weather fronts; North Atlantic and European infra-red satellite images showing cloud-cover; combined infra-red and rain-radar images of the UK; maps of wind speed and direction at 00 and 12 UTC; observations of pressure, wind speed and direction, cloud cover, air and dewpoint temperature at selected UK and European stations in data tables.
4. UK maps of key climate variables from observing stations including maximum, minimum and grass minimum temperature, rainfall, sunshine, gust speed and snow.
5. Further guidance notes

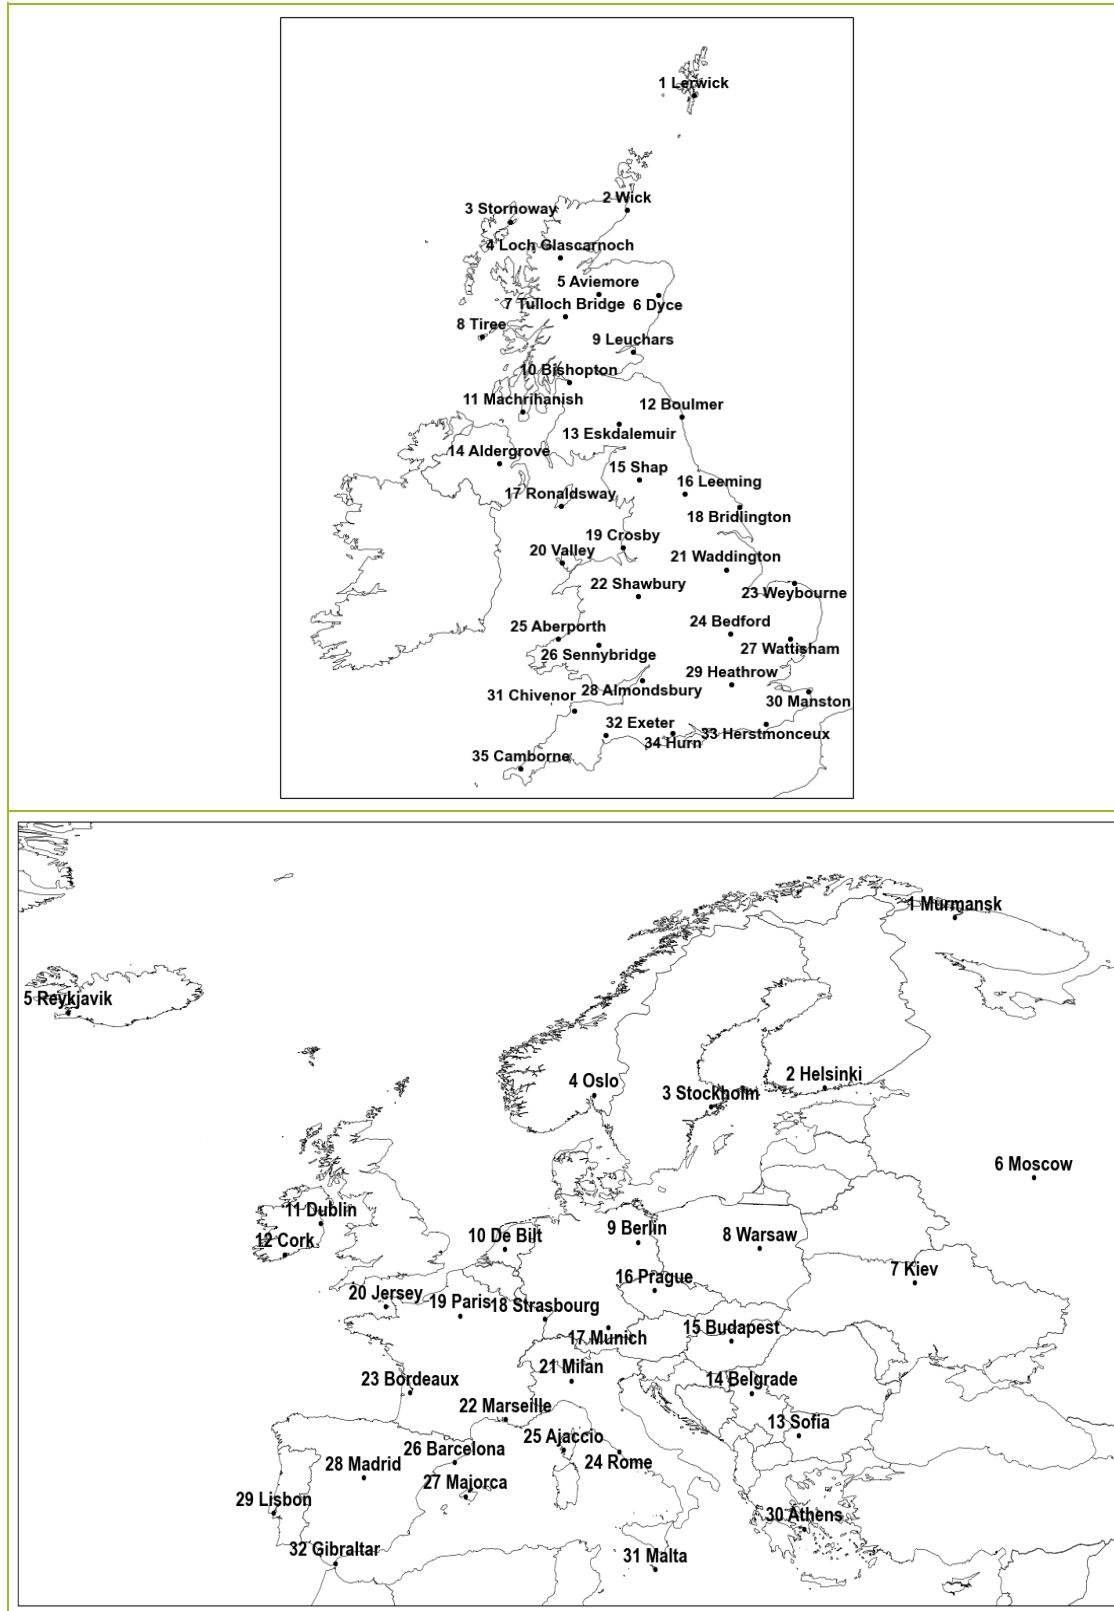

If you spot any data errors or omissions in this product please contact the Met Office.

## Daily Weather Summary for Sunday 01 October 2023

This day's summary created 08/10/2023 04:04

### Summary of the UK Weather for Sunday 01 October 2023

A band of rain moved northwards across Scotland, clearing mainland Scotland by early morning. The rain was heaviest in the west due to orographic effects. Heavy rain also affected Orkney in the early hours. A further band of rain and showers moved into north Wales and progressed northeastwards through the morning. Elsewhere had light cloud or clear spells. Winds were light over much of the country but stronger near some coasts. It was a warm night for the time of year. Sunday started with much of the southern half of the UK covered in cloud. A band of rain accompanying a cold front slowly progressed southeastwards during the day, easing later. Further north, another front progressed west to east across Scotland bringing some rain to the northwest during the morning, but this had largely cleared by the afternoon, leaving sunny spells for the rest of the day for Scotland, Northern Ireland and northern England. Southeast England stayed dry, albeit slightly cloudier. It was another day of slightly above average temperatures, warmest in the southeast.

### Summary of the UK Weather for Monday 02 October 2023

Overnight, a slow moving weather front brought mostly cloudy conditions to England and Wales. Higher cloud also spread over Scotland and Northern Ireland. The south and southwest saw low cloud, mist and fog patches, especially around coasts, along with some patchy light rain and drizzle. Northwest Scotland saw clearer spells and some showers. It was a notably mild night in the south, and nearer average further north. This theme continued into the morning. As the morning progressed, showery rain began to move into north Wales and southwest England. This became more widespread by midday, spreading northeast through the afternoon, with heavy showers and thunderstorms breaking out across some central and southern areas, moving northeast into eastern England through the evening. Rain also became more persistent across north Wales and northern England through the afternoon and evening. Southwestern coastal areas continued to see some low cloud and, northwestern Scotland continued to see sunny intervals and showers, while the far southeast saw some sunny spells during the afternoon. Temperatures were above average in the southeast, and closer to average further northwest.

## Daily Weather Summary for Tuesday 03 October 2023

This day's summary created 10/10/2023 04:03

### Summary of the UK Weather for Tuesday 03 October 2023

Thunderstorms cleared East Anglia around midnight, with frontal rain across much of central and northern England clearing through the early hours. The far north of England and eastern Scotland was dry. Other parts of Scotland saw showers moving in off the Atlantic, with a few in northern England. Elsewhere, southern counties were dry through the night. Showers moved into many western areas of England and Wales by dawn with a few developing further east. Moderate winds picked up for a period in the south associated with the developing low clearing eastwards, easing by dawn, and it was breezy in western Scotland. Elsewhere, winds were light. Temperatures were mild in the far south, nearer average elsewhere. Showers persisted throughout the day across the UK, but mainly in the west, the heaviest and most frequent of these in the northwest. Showers were broken up by spells of sunshine, with the south and southeast seeing the longest dry spells and feeling fairly warm. Showers eased throughout the day becoming lighter and more isolated in the south. Widely breezy in a west/northwesterly flow.

### Summary of the UK Weather for Wednesday 04 October 2023

Over the night, conditions started off clear and dry for most. However, as a trough travelled across northern areas, it has brought moderate rainfall to Scotland and parts of northern England. For the rest, localised showers occurred western coastal areas, which has brought light showery rain. The east remained mostly dry. Wind was blowing easterly over the night. The day began with a band of rain over central Scotland and Northern Ireland which persisted over this area for much of the day, spreading southwards and narrowing into the evening. There were isolated light showers elsewhere but it was generally fine and dry in the south, and cloudy for most. It was widely breezy in a predominantly southwesterly flow. Temperatures remained a little above average for the time of year.

## Daily Weather Summary for Thursday 05 October 2023

This day's summary created 12/10/2023 04:03

### Summary of the UK Weather for Thursday 05 October 2023

Cloud and outbreaks of rain slowly moved eastwards during the early hours, affecting Northern Ireland, southern and western Scotland, Wales and western parts of northern England. Elsewhere remained dry with clear spells. Temperatures held up under the cloud, but it was chilly where skies were clear. Through the courses of the day northern parts of the UK were dominated by low pressure, located to the northwest of the UK, while higher pressure set over the far south. A couples of fronts associated to this low centre made a northeastwards passage across the country, bringing heavy rain for Northern Ireland, Scotland, northern England and parts of wales. Most of this heavy precipitation cleared into the evening, but some outbreaks of rain happened for southern parts. Broadly cloudy with some, with some sunny spells of the southwest. Moderate to strong southwesterly winds were recorded through the day. Temperatures were slightly above average for the time of the year.

## Daily Weather Summary for Thursday 05 October 2023

## Daily Weather Summary for Friday 06 October 2023

This day's summary created 13/10/2023 10:20

### Summary of the UK Weather for Friday 06 October 2023

A low pressure progressed eastwards to the north of Scotland, while the south was dominated by a high pressure area over the continent. Scotland, Ireland and the north of England saw bands of rain and showers, which progressed eastwards. The rain was heaviest in the west, diminishing as it approached eastern areas. Elsewhere was dry with generally clear skies. Winds were strong in the north of Scotland becoming lighter in the south. It was a mild night in the south, but cooler farther north. Weather during the day was mostly dominated by low pressure to the north of the UK. This, in collaboration with another deep low centre over the Atlantic, drove a moderate to strong westerly flow across the country. Rain was heavy and persistent over Scotland and some northern areas. A partially cloudy picture everywhere else, with sunny spells in places. Temperatures remained close to average, with peaks in the southeast.

### Summary of the UK Weather for Saturday 07 October 2023

Saturday began with rain covering much of the northern part of the UK, whilst the South remained relatively dry with fewer light patches. The rain in the north was significant particularly over northern England and Scotland, with the highest rates over the South Highlands, north of Glasgow. This stationary front drifted the rain eastwards through the night, the worst of it remaining consistently over Scotland. It was cloudy over much of the UK, except in parts of the far south where it was dry and clear. Fog moved in over the southwest of England and winds were moderate around coastal areas. Temperatures were particularly cool in the north under the rain, but milder in the south. The front stalled over central Scotland, bringing widespread heavy rain throughout the day to Scotland and border regions. The highest rainfall totals were over Argyll and Perthshire, with Tyndrum in Perthshire recording more than 100mm over a 24 hour period. Elsewhere, it was a day of sunny spells with variable amounts of cloud, with the heaviest cloud, away from Scotland, over central and northern England and Northern Ireland. There was a large north-south contrast in temperatures, with areas in Scotland struggling to reach double figures, while large parts of southern and central England and Wales reached 20 degrees Celsius.

### Summary of the UK Weather for Sunday 08 October 2023

Sunday started with persistent heavy rain over Scotland. This courtesy of a couple of fronts, associated to low pressure centres, that lingered over northern parts of the country. Winds decreased in strength from previously, with light southerly winds being recorded across much of the UK. High pressure started to build to north and south of the country by this point, this allowing for more settled spells over southern parts of the country. A north-south split in temperature was observed through the period, with average to warm temperatures over the south and below average temperatures in the north. It was cloudy for Scotland, North Ireland and northern England, however fairly clear elsewhere. Sunday was another day of contrasts, with heavy rain across much of Scotland, albeit less so than Saturday. The rain fell largely in three waves, with a widespread band clearing eastwards through the morning, before a secondary band, associated with a warm front extending from a depression sat to the northwest of the UK, moved in from the west, affecting the majority of Scotland by mid-morning. This also shifted eastward into the afternoon before the third outbreak moved into the northwest and again swept eastward during the afternoon and into the evening. Elsewhere, after a cloudy start with some early morning fog, much of the rest of the UK enjoyed another fine and dry day though cloud lingered into the late morning on eastern coasts. Temperatures were, yet again, unseasonably warm, with much of the south and central parts of England and Wales reaching 20 degrees Celsius.

### Summary of the UK Weather for Monday 09 October 2023

Low pressure was the dominant feature through the beginning of Monday, especially over the north. Heavy rain over Scotland became less persistent, however a couple of fronts lingered across northern regions, causing rain over Scotland and northern England. Often cloudy across the north, fairly clear and dry everywhere else, although some overnight fog developed over the southwest and western coasts of the UK. Light westerly winds were predominant across the country. Temperatures were close to average for most, colder in the north. During the day, a cold front straddled across northern England and an occlusion over Scotland brought a band of showery rainfall that has lingered over the area. The rainfall later dissipated into the evening. The rest of the country saw a dry and sunny day with a few clouds. Wind was calm throughout the day.

This day's summary created 17/10/2023 04:02

### Summary of the UK Weather for Tuesday 10 October 2023

A frontal system approached the UK from the west at the start of Tuesday, with a broad band of rain spreading into Northern Ireland early on. The rain then reached western Scotland and northern England before sweeping eastward through the night. Cloud covered large parts of the UK away from the rain with widespread fog developing in western and southern coastal areas by the middle of the night. Much of England and Wales stayed largely dry though. Under the cloud, it remained a mild night in general, with many places remaining in double figures. Fog and low cloud lingered over much of southwest England and Wales through the morning and was slow to clear, particularly over southern coastal regions. It was also a murky start for parts of Scotland and northeast England as the band of rain cleared eastwards in the early morning. This was followed by blustery showers across many parts of the north, these turning heavy at times, particularly over the highest ground. They became more organised over northwest Scotland for a time. It was warm for many, particularly under the clearest skies in the south and southeast. Rain, heavy at times moved southwards from Scotland and Northern Ireland into England and Wales into the evening.

## Daily Weather Summary for Wednesday 11 October 2023

This day's summary created 18/10/2023 04:03

### Summary of the UK Weather for Wednesday 11 October 2023

A double frontal feature was slowly travelling southwards across the UK. It has brought heavy rainfall for those affected under the fronts in northern England to the Pennines area. The rest, it was a largely dry and clear evening with some localised showers particularly in coastal southwest regions. A trough has also brought some showers to northern Scottish regions. Wind was light, blowing easterlies. A band of heavy rain moved slowly south-eastwards across Wales and central England. In Scotland, a northerly air flow brought a number of showers to the north and a slow-moving depression caused strong winds across Shetland and northern parts of Scotland. To the south of the rain, skies were cloudy with mild temperatures for the time of year. North of the rain temperatures were normal to lower than average.

This day's summary created 19/10/2023 04:03

### Summary of the UK Weather for Thursday 12 October 2023

Patchy rain affected much of the southern half of the UK, but gradually broke up through the early hours, with occasional heavier bursts. Elsewhere it was largely dry with clear skies overnight, except for the odd outbreak of drizzle over northern Scotland. Into the morning, it became largely cloudy in the south, feeling muggy, with patchy rain and drizzle and some lightning early on in the far east. In the north it was mostly dry and clear with sunny spells and isolated blustery showers affecting the far northwest of Scotland. The low cloud lingered in the south throughout the day. Into the evening an organised band of rain began to push into the southwest and progress eastwards into the night, the rain heavy in places and windy at times. It remained muggy in the south under the rain but cold in the north under the clearer skies.

## Daily Weather Summary for Friday 13 October 2023

This day's summary created 20/10/2023 04:03

### Summary of the UK Weather for Friday 13 October 2023

Rain affected much of England and Wales overnight. This was heaviest, and most persistent, across Wales and central England initially, but it intensified over the southeast in the early hours. A band of rain crossed the north of Scotland, which was followed by scattered showers. These were wintry on higher ground. It was windy around the northern isles and into northern Scotland. Winds were initially light in the south but increased in strength as a depression approached southwest Ireland. It was cold to the north of the heavy rain, but mild and humid to the south of it. Friday was dominated by two low pressure centres, located to the north and southwest of the UK. This synoptic set up pushed moderate to fresh northerly winds into the country, and it remained breezy through the day. This also pushed cold air masses across the country creating a cold showery regime over the north and some western areas, while the south and central regions saw a heavy band of rain. It was cloudy for most with clear spells over the north where cloud broke more frequently. Below average temperatures were recorded for most, but it remained slightly above average in central and southeastern parts of the UK.

### Summary of the UK Weather for Saturday 14 October 2023

The frontal systems that caused the heavy rain over England over the past few days moved southeastwards over the south of England and into the near continent by the early hours. A low pressure to the north of Scotland progressed slowly eastwards bringing strong northerly winds with convective showers to the north of Scotland. This left cold air in the wake of the departing rain to the south. Winds were strong to gale force in the northern isles and northern Scotland, and strong on western coasts, but lighter towards the southeast. It was mild to warm to the south of the rain, but temperatures quickly dropped behind it leaving most of the country in lower-than-average temperatures. During the day, previous frontal systems have cleared the UK, however, troughs from the low pressure northeast of the UK has travelled southwards has brought showers and sunshine the country. Winds were blowing southeasterly.

### Summary of the UK Weather for Sunday 15 October 2023

A large area of high pressure sat over the UK by the start of Sunday. Scattered showers occurred over Wales and Scotland initially, but later a warm front approached the UK reaching the far north and causing heavy rain over Scotland through the morning, otherwise dry for most. It was cloudy for Scotland, Wales and along coastal areas through the period, although England and central parts remained fairly clear, this accompanied with northerly moderate to fresh winds. Temperatures were below average for most, with freezing conditions over the north. Showers continued to feed into northern and western Scotland through the morning, but became confined to the north by midday. Elsewhere it was generally dry, with any early mist or fog clearing to a bright day. Cloud began to push in to the southwest of the UK through the afternoon, reaching much of Wales and central England by late afternoon. Into the evening showers continued in northern Scotland and cloud had spread to much of the UK.

### Summary of the UK Weather for Monday 16 October 2023

Monday morning has stayed mostly dry and clear for most across the country. This was due to a high pressure above the country. However, northern areas such as Scotland and northern England suffered from a few occasional showers. Wind was mostly calm. Mainly dry with variable, often large amounts of cloud affected the UK, but bright or sunny spells developed in places through the morning. Showers affected eastern portions of Northern Ireland, western and northern parts of Scotland and also the far southeast of England at times. Cloud thickened from the southwest during the afternoon with rain into the far southwest of England later and into the evening, whilst elsewhere it remained dry and bright. Clear spells and variable cloud developed across much of the UK with frost and isolated fog patches across northern areas towards midnight.

## Daily Weather Summary for Tuesday 17 October 2023

This day's summary created 24/10/2023 04:02

### Summary of the UK Weather for Tuesday 17 October 2023

Tuesday morning stayed mostly dry and clear for the majority of the UK. However, there was some heavy rainfall in the very far southwestern tip of England, driven by the associated fronts from an approaching low pressure system to the south west of UK. There were also a few localised showers in the Scotland, Pennines and Midlands. Wind was mostly light to calm. It was a quiet day of weather as Storm Babet approached. Most had hazy sunshine, although the cloud was heavier in the southwest as a warm front approached bringing further rain into the southwest, Wales and Northern Ireland through into the evening and night. There were some isolated showers elsewhere. Winds were light in the north, and initially elsewhere but strengthened through the period, especially in the south and southwest. Temperatures were a little above average.

### Summary of the UK Weather for Wednesday 18 October 2023

The approach of Storm Babet from the southwest brought persistent rain to much of Northern Ireland and western parts of England and Wales through the night, with bands of showers also moving into the southwest early on. By dawn, western parts of Scotland were beginning to see rain. Elsewhere to the east and north, it remained largely dry, with variable amounts of cloud. Winds began to strengthen across northern and western areas. Through the day, Storm Babet brought increasingly organised and persistent rain with locally heavy outbreaks across southern England, whilst further north, increasing cloud and patchy outbreaks of rain affected parts of the Midlands following a bright start. Much of northern England, Scotland and Northern Ireland remained mostly dry with a few bright spells through the afternoon, although cloudier with outbreaks of rain near western coasts. Through the evening and night, rain continued to push northwards into northern regions, heavy in places and becoming persistent across Scotland whilst becoming drier further south. Breezy in most areas by day, with winds strengthening across Scotland into the late evening.

This day's summary created 26/10/2023 04:02

### Summary of the UK Weather for Thursday 19 October 2023

A system of depressions, including Storm Babet, approached the UK from the southwest. The associated fronts from these systems brought widespread rain, at times turning heavy, to central England, northern Wales and Northern Ireland early in night, and spread northwards over much of northern England and Scotland by dawn. The south was drier through the night with some clear spells, as was the far north of Scotland, though the southwest of England did see a series of heavy showers move through during the night. Strong gusty winds accompanied the rain, particularly around eastern coasts and over Scotland, with calmer conditions to the south. During the day, the persistent band of rain moved slowly north into southern and eastern Scotland, where it became heavy across parts of Aberdeenshire and Angus, persisting for the entire day. Further south, there were showers and outbreaks of rain, slowly moving north. There were a few sunny intervals across England and Wales, however during the afternoon, showers became more widespread, locally heavy and thundery, especially across the south and west. Through the evening, further outbreaks of rain moved into the south while eastern Scotland saw persistent, heavy rain continue with severe impacts expected overnight. Winds were very strong in northern and eastern Scotland, lighter elsewhere.

## Daily Weather Summary for Friday 20 October 2023

This day's summary created 27/10/2023 04:02

### Summary of the UK Weather for Friday 20 October 2023

Fronts associated with Storm Babet brought heavy rain to eastern Scotland and across parts of southern and central England. There was some convective activity in the southeast. Throughout the night, the rain persisted over eastern Scotland, bringing exceptional totals, whilst the band of rain over England headed northwest into Wales and Northern Ireland. There were also strong winds and gusts along eastern coasts. A frontal wave and developing surface low across southeast England brought widespread, persistent rain across much of central, northern and eastern regions of England, heavy in places. This area of rain also extended northwestwards across Wales through the Irish Sea to Northern Ireland. This moved slowly bringing large accumulations to many areas. Persistent rain also affected an area from northeast England through to northeast Scotland with easterly gales and high gusts occurred along the North Sea coasts of Scotland and England. In contrast, many southern areas of England and Wales experienced light winds. Rain persisted across many central and northeastern areas through the evening with a few showers affecting southern counties of England.

### Summary of the UK Weather for Saturday 21 October 2023

Overnight, the persistent rain across many central, northern and eastern parts of England and north Wales continued to slowly edge north and become lighter, but persisted for some northern and central parts. Frequent showers merged into further persistent rain over eastern and northern Scotland for much of the night. Some outbreaks of rain moved into southwest England, and some locally heavy showery outbreaks moved into the southeast before dawn. Some northwestern parts of the UK and parts of southern and eastern England remained dry. Winds were moderate to strong in the north, lighter further south.

Temperatures were coolest in the north and mild in the south. During the day, The persistent rain continued in northeast Scotland accompanied by strong easterly winds. Further south had brighter weather with scattered showers. A convergence line in the southeast brought a more organised line of sometimes heavy showers, with occasional funnel clouds. The rain clung on to Shetland overnight. Winds were strong in north Scotland, and through the English Channel affecting southern coasts. Temperatures were cool to average, dropping away under clearer skies overnight.

### Summary of the UK Weather for Sunday 22 October 2023

Through the evening, rain cleared the far north of Scotland except the northern Isles. This left a predominantly dry night across the UK with a few showers near western coasts, filtering further inland across northwest England. Strong winds in the north of Scotland eased to mostly light by the end of the night, with light winds for many other areas away from northwest coasts. Clear spells allowed a cool night for central and northern areas, with a few fog patches. Heading into the day time, rain has mostly cleared across the UK, which has brought a mostly dry and sunny day for most with scattered clouds. However, there were some localised showers predominantly in coastal areas. Wind was calm throughout the day.

### Summary of the UK Weather for Monday 23 October 2023

It was a generally cloudy night with some clearer spells for most. It was clearer across Scotland causing temperatures to fall giving icy conditions widely across the region and into northern England. Isolated showers peppered the far northwest and southeast. Fog formed in the early hours across the midlands, east and southeast. Winds were light in the east, but stronger in the west, and the northern isles, as low pressure approached. Temperatures were chilly in the north, but milder farther south under the cover of cloud. Into the day, a weak ridge of high pressure extended across much of the UK bringing a chilly start to the day, particularly across some central, northern and eastern regions where mist, fog and frost occurred. Mist, fog and frost lifted quite readily, although lingered across parts of central and northern England. Some bright spells developed, especially towards eastern regions whilst thicker cloud and outbreaks of rain moved in across the far southwest of England in the latter half of the afternoon reaching northwestern parts of Ireland. A band of rain pushed northeastwards across southwest England into Wales whilst further outbreaks of rain affected eastern coasts of England. Generally gentle winds with a few moderate breezes.

## Daily Weather Summary for Tuesday 24 October 2023

This day's summary created 31/10/2023 03:02

### Summary of the UK Weather for Tuesday 24 October 2023

A band of heavy rain affected Wales and southern England at midnight, and gradually moved northeast through the early hours, reaching north Wales and southeast England by dawn. Southwest of this band sporadic showers broke out in the southwest and Northern Ireland. Scotland, northern and eastern England remained dry at first but patchy rain soon developed, turning heavy over northwest England. Tuesday was under the influence of several low pressure centres. This caused a southerly flow over southern parts and an easterly flow across northeastern parts of the UK. A generally unsettled theme was observed through the day, with central parts of the UK being affected by a band of rain caused by an occlusion, as well as heavy rain arriving to the south by the evening. Showery for Wales, North Ireland and southwest England. It was Cloudy with light winds for many. Temperatures were slightly below average.

### Summary of the UK Weather for Wednesday 25 October 2023

Several occlusion frontal systems have dispersed at midnight, several troughs surrounding the north east to east of Ireland, as well as the southern coast of the UK, this has brought extra rainfall to both areas. With the southwest being rained the heaviest over the night. Wind was generally calm throughout the night. Wednesday weather was governed by low pressure to the northwest of the UK. This pushed southwesterly winds through the day. A large area of rain affected the northwest of the UK through the morning and into the afternoon, with the wettest conditions over eastern Scotland. A band of rain arrived to the southwest by the end of the day. Light wind for most, but breezy in northwestern parts. Often cloudy with near average temperatures.

### Summary of the UK Weather for Thursday 26 October 2023

The evening started off relatively calm and dry for most across the UK. However, several occluded fronts crept over the UK, which has brought a band of heavy showers travelling from the southwest and south wales into central areas. Winds were relatively calm. During the morning, outbreaks of rain across central, northern and eastern England slowly moved northeast. Further showery outbreaks affected Northern Ireland, along with southwest and northern Scotland. The band of rain became heavier as it slowly moved northeast, affecting eastern counties of England, and then southeast and eastern Scotland, where it became persistent and heavy at times through the evening. Elsewhere, southern and western parts of the UK saw sunny spells and showers, locally heavy. A few also spread inland into the Midlands. Winds were mostly light to moderate, breezier in northeast Scotland and southwest England. Temperatures were near to slightly above average.

### Summary of the UK Weather for Friday 27 October 2023

Blocked occlusions brought persistent rain to eastern Scotland through the night. Showers in the English Channel also moved inland particularly in the southwest. A further band of rain moved over Northern Ireland and into western Scotland by the early hours. Much of southeastern, eastern and central England was affected by fog. Winds were calm to light in the south. The North Sea coast of Scotland had breezier conditions. Temperatures were widely in single figures, although edging into double figures in the part of Scotland and the southwest. During the morning, outbreaks of rain continued to affect eastern Scotland, persistent in places. Fog was slow to clear for many central and eastern parts of England, lifting into low cloud. Bands of showers, sometimes clumping together, affected various other areas of the country, with one stretching from southeast England to southwest Scotland. Southern and western coasts saw the heaviest and most frequent showers, with south west Wales focus for another clump of heavy showers. This theme continued through the afternoon, with southern and western coasts seeing the most showers, locally heavy and thundery. Parts of eastern Scotland continued to see persistent rain, and further heavy showers moved into northeast England and eastern Northern Ireland. In between, there were fewer showers, with sunny spells for some, mainly in central and southern England.

This day's summary created 04/11/2023 03:02

### Summary of the UK Weather for Saturday 28 October 2023

Saturday started fairly unsettled with low pressure, to the west of the UK, being dominant. A southwesterly flow was observed through the first half of the day. This caused a conglomeration of occlusions to push northeastwards across the country. Bands of rain and scattered showers, heavy in places, affected majority of regions, especially Wales, Scotland, southern, southwestern and northeastern England. Broadly cloudy with few clear spells across the south and breezy conditions. Slightly below to close to average temperatures were recorded. Showery rain continued to affect eastern Scotland, Northern Ireland and Wales through the morning, and turned heavy over southeast England. Further rain pushed in to the far southwest of the UK by mid-morning, with some heavier bursts. By the afternoon rain continued to affect Scotland and Northern Ireland, with the band of heavy rain reaching Devon, Somerset and Dorset. This rain continued to push northeast into Wales, and central and southern England. This reached the southeast by evening, with some locally intense and thundery bursts, with further locally intense, thundery outbreaks following through the night.

This day's summary created 05/11/2023 03:02

### Summary of the UK Weather for Sunday 29 October 2023

Overnight, heavy outbreaks of rain continued northwards across the Midlands into northern England. Further outbreaks of rain continued to move into eastern Scotland. The southeast of England and into East Anglia saw further heavy, locally thundery outbreaks. Rain also moved into Northern Ireland. Towards the end of the night, a heavy band of rain became slow moving across the far northeast of England and parts of southern Scotland. Behind this, southern and western coasts continued to see showers, with some clear spells for much of England and Wales by dawn. It was windy across the far north, and around southern and western coasts. Temperatures were near to above average. Through the day, the wet theme continued with heavy rain over many parts of Scotland and the north. The heaviest rainfall in the east of these parts. Heavy, thundery showers progressed up southern, southwestern and Welsh coasts moving into the northwest. Showers, some heavy, continued in the south and west overnight. Winds were moderate in many areas, but slightly stronger in northern Scotland. Temperatures were generally around average.

### Summary of the UK Weather for Monday 30 October 2023

Overnight, bands of shows continued to affect southern and western coasts of England and Wales, locally heavy. A persistent band fed into the southern half of Northern Ireland, giving some long lasting heavy outbreaks in some places. The north of England saw some outbreaks of rain slowly fizzle out by dawn. The Midlands and East Anglia were mostly dry with just the odd shower, as was Scotland away from the far south. Winds were relatively light for many but stronger across southwestern Scotland and Northern Ireland, as well as some southern and western coasts of England and Wales. Temperatures were mostly near average, milder in the south. A dry start for large parts of the country. Showers focused in the south west and northern Midlands, these moving northwards through the morning. Large areas of clear skies in the south, cloudier further north. Heavy showers in the southeast late morning, some thundery. Heavy rain or showers moving into eastern Northern Ireland into the early afternoon. Widespread showers for the rest of the country. Driest and brightest in Scotland. Towards the evening, heaviest showers in the Midlands and Northern Ireland, continuing overnight.

### Summary of the UK Weather for Tuesday 31 October 2023

Persistent heavy rain caused disruption in Northern Ireland throughout the early hours, continuing through dawn. Elsewhere bands of rain moved east across England and Wales, turning heavy at times, with just some sporadic showers in northwestern Scotland. Ahead of this, some mist and fog patches formed in eastern England. In the morning heavy rain in the Midlands moving northeast. Elsewhere a mostly dry morning. Heavy rain arrived into the southwest around midday, moving slowly northeastwards, affecting Northern Ireland by mid-afternoon. A cloudy day for much of the rest of the UK with scattered showers around. Sparse showers around the rest of the UK in the afternoon. The south west and Northern Ireland was affected by the band of heavy rain into the evening, moving northeast into the Midlands by midnight. Further north and Scotland remained clear and dry for most. Winds light to moderate. Stronger in the SW with the rain.

# Daily Weather Summary for Tuesday 31 October 2023

## Daily Weather Summary for Tuesday 31 October 2023

None of the selected stations observed a day of sleet or snow falling or non-zero snow depth at 0900 UTC.

## Guidance Notes

UTC = Universal Coordinated Time. For the UK UTC is the same as GMT (Greenwich Mean Time).

National boundaries shown on the European station map are for illustrative purposes only.

### Daily extremes

- Daily extremes have been manually confirmed by Met Office Observations Quality Management as valid observations from the live database at the time of checking. However, more extreme values may still be possible if they occur after the time of production.
- Mountain stations above 500 masl are excluded from lowest temperatures, highest gust speeds and greatest snow depths at 0900 UTC. This is because they are not considered representative of low level areas.
- Counties quoted against each station are based on historical county boundaries pre-1974 and may not reflect current administrative boundaries.

### Analysis charts and satellite imagery

- The satellite imagery is infra-red imagery from the geostationary MSG satellite.
- The rainfall image is derived from satellite data from MSG and rain-radar data. This represents a snapshot of instantaneous rain-rates at 0000 UTC and 1200 UTC and so does not necessarily reflect daily accumulations in the rainfall station map.
- Any analysis charts or satellite images which are unavailable will be displayed as white space.

### Station maps

- The UK maps show station data for the same set of stations presented UK data table. These stations are selected to provide good spatial coverage across the UK; they represent only a fraction of the overall UK observing network.
- Wind speed maps show wind speed in Kt and direction both averaged over the hour up to the time of observation. 1 Kt = 1.151 mph.

### Hourly station data

- The data tables provide spot hourly observations from synoptic messages at 0000 and 1200 UTC. Missing data are denoted by '-'.

- Pressures are mean sea level pressure in hPa.
- For UK stations, Gibraltar and Jersey, the wind speeds and directions are both averaged over the hour up to the time of observation. However, for European stations wind speeds and directions are both averaged over a 10-minute period up to the time of observation.
- Wind speeds are in Kt. Wind directions are stored in the database every 10 degrees and have been converted to the nearest point of the compass. These give the direction the wind is blowing from, not to.
- Cloud amounts are in Oktas from 0 (clear) to 8 (overcast). 9 indicates sky obscured (eg by fog).
- Air temperature and dew point temperature are in Celsius.

### **Temperature maps**

- Daily maximum, minimum and grass minimum temperatures are in Celsius.
- The period for the daily maximum temperature is defined from 0900 UTC on the day in question to 0900 UTC the following day.
- The period for the daily minimum and grass minimum temperatures is defined as 0900 UTC the previous day to 0900 UTC on the day in question.
- On any given day the minimum will typically occur in the early hours of the morning and the maximum in early afternoon.

### **Rainfall, sunshine and max gust speed maps**

- Daily rainfall is in mm from 0900 UTC on the day in question to 0900 UTC the following day.
- Daily sunshine is in hours from Kipp and Zonen CSD1 automatic sunshine records. Bright sunshine is defined as exceeding 120 W/m<sup>2</sup>.
- Max gust speeds are the daily max gust in Kt from 0000-0000 UTC

### **Snow maps**

- The day of snow falling map displays data from present weather sensors, showing stations which have recorded sleet or snow falling at any point in the day (0000-0000 UTC).
- The snow lying map shows level snow depth as recorded by the automatic snow depth sensors at 0900 UTC. These snow depth sensors do not record snow depth if this is less than 1cm.
- Snow depth sensors are normally operational from October to April, in the event of snow falling outside this period data availability may be limited.

- Snow maps will only be displayed if one or more of the selected stations on that date have recorded either snow falling or non-zero snow depths. If snow maps are not displayed it is still possible that other stations in the network have recorded a day of sleet or snow falling or non-zero snow depth.
