CLIMATOLOGICAL MEMORANDUM 78

**AVERAGES OF TEMPERATURE 1941-70 FOR
SHORT-PERIOD STATIONS IN THE UNITED KINGDOM**

by

Joyce Laing

Climatological Services (Met. O. 3)

March 1976

CLIMATOLOGICAL MEMORANDUM NO 78

Averages of Temperature 1941-70 for short period stations in the United Kingdom

Averages of temperature for the period 1941-70 for a selection of places in the United Kingdom are published by Her Majesty's Stationery Office in Met O 883⁽¹⁾. This memorandum supplements that publication, and presents weighted 1941-70 averages for a further 124 places which were excluded from Met O 883 by the strict selection criteria imposed. The stations now included are those which, during the period 1941-70, fall into the following categories:-

- A. At least 20 years of record, but had ceased reporting prior to 1970.
- B. At least 20 years of record, but where there had been a small site change, or where a few individual months were missing.
- C. 15 to 19 years of record.
- D. 11 to 14 years of record.

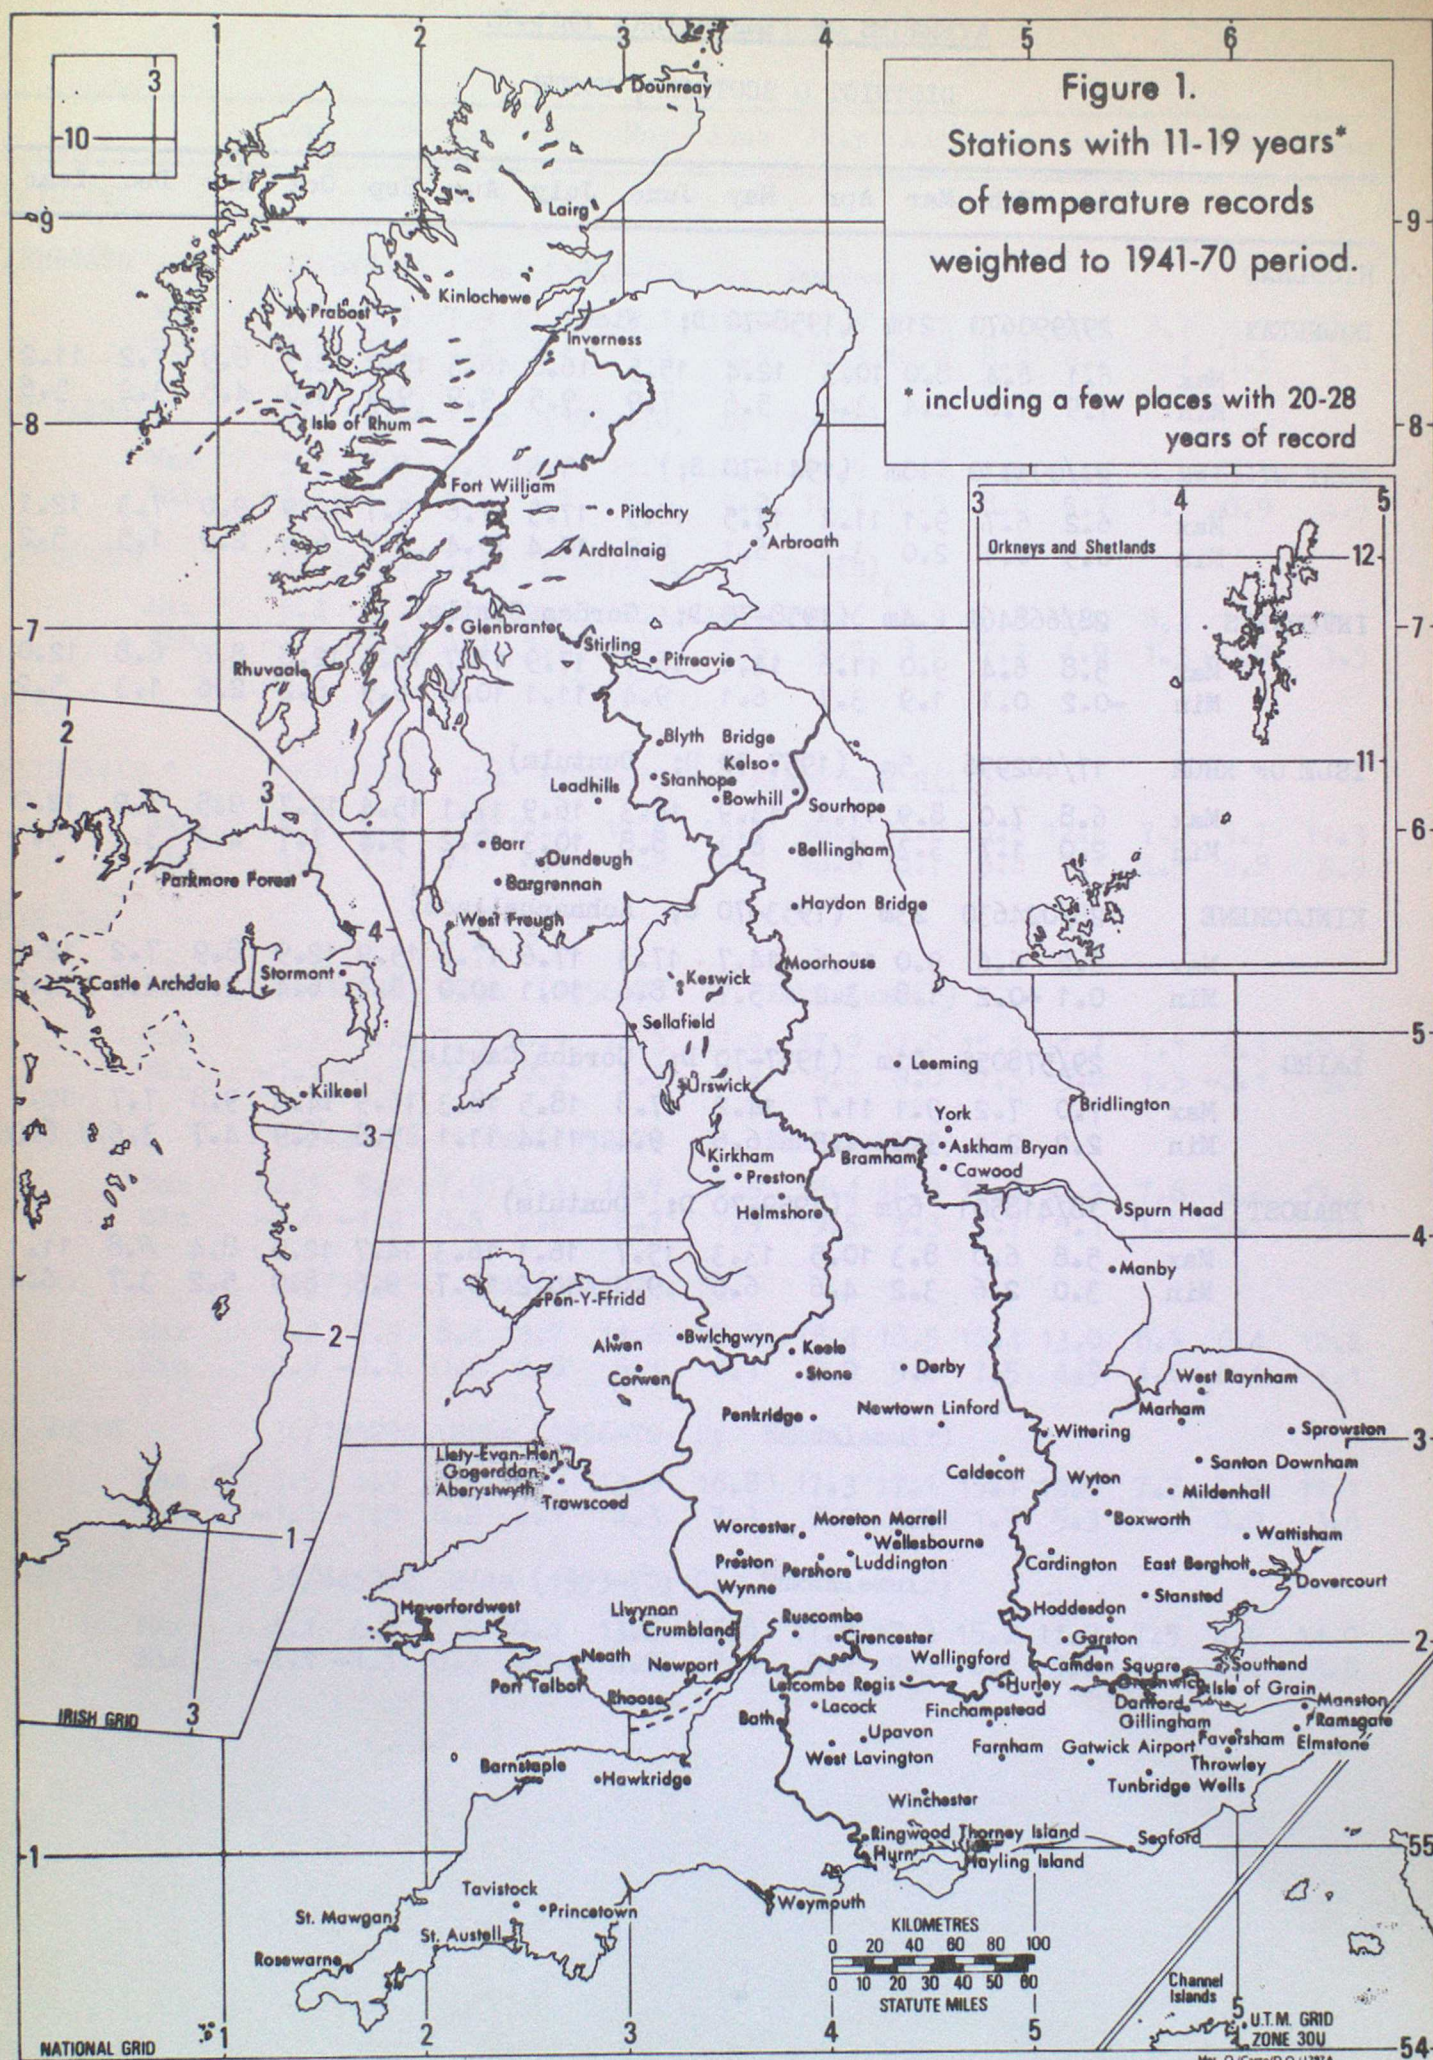

The weighted averages were computed by comparison with those for near-by stations, using the method described in Met O 883. Obviously the longer the period of overlap with a near-by station, the more reliable is the weighted average. An overlap period of 10 years or less produces figures of very doubtful validity. A period of at least 15 years of overlap (Categories A-C above) is needed to give a satisfactory value, but weighted averages based on 11 to 14 years of overlap (category D) may be useful for some purposes and are therefore included. Four stations, Fort William, Kelso, Sprowston and Mildenhall, which had at least 28 years of records did not have any weightings applied to their averages.

The tables in this memorandum give the mean daily maximum and mean daily minimum temperatures in degrees Celsius for each month and the year. They have been calculated from readings from thermometers exposed in a louvered screen approximately 1.25 metres above short grass. In the majority of cases the maximum and minimum thermometers are read and re-set at 09 GMT daily. Some stations (which are indicated in the tables by a star (*)) read and re-set their thermometers twice a day, at 09 and 21 GMT (at 07 and 18 GMT during the period January 1941 to July 1944 and at 06 and 18 GMT during August to December 1944); thus the maximum temperatures refer to the 'day' period and the minimum temperatures refer to the 'night' period. During the winter months average differences between the 12-hour and the 24-hour extremes can be as much as 0.7 deg C.^(1,2)

The stations are arranged in the same order as they appear in the Monthly Weather Report.⁽³⁾ The National Grid Reference and the altitude of each station are given in the tables; the period of record, the category (A, B, C or D) and the station with which the weighting comparison was made are added in parenthesis. The positions of the stations are shown in figure 1.
