## Daily Weather Summaries for February 2022

**If you have any questions or feedback about this product or wish to obtain further data please contact the Met Office.**

This document contains daily weather summaries for each day of February 2022. The Met Office National Meteorological Library and Archive holds a continuous record of daily weather summaries or daily weather reports from 1860, and these daily weather summaries form a continuation of that series.

The purpose of each summary is to provide an overview of the weather conditions across the UK on that day, with the historical emphasis mainly based on observations from surface network of weather stations, although the format has varied over the decades. While the emphasis remains on observations from the surface network, the current daily weather summaries supplement these by including satellite and rain-radar imagery to provide a more complete overview. The current format of the daily weather summaries is as follows:

1. Text summary of the main characteristics of the weather during the day, written by an operational meteorologist in the Met Office operations centre.
2. Table of daily extremes for the UK for key climate variables including temperature, rainfall, sunshine and gust speeds.
3. Overview of the synoptic situation at 00 and 12 UTC comprising: analysis charts showing the surface pressure pattern and associated weather fronts; North Atlantic and European infra-red satellite images showing cloud-cover; combined infra-red and rain-radar images of the UK; maps of wind speed and direction at 00 and 12 UTC; observations of pressure, wind speed and direction, cloud cover, air and dewpoint temperature at selected UK and European stations in data tables.
4. UK maps of key climate variables from observing stations including maximum, minimum and grass minimum temperature, rainfall, sunshine, gust speed and snow.
5. Further guidance notes

If you spot any data errors or omissions in this product please contact the Met Office.

## Daily Weather Summary for Tuesday 01 February 2022

This day's summary created 08/02/2022 03:03

### Summary of the UK Weather for Tuesday 01 February 2022

A series of fronts moved southeastward across the UK through the early hours, bringing associated bands of rain and drizzle from Scotland to the midlands. Rain eased through the night, leading to some clearer spells across the country. Winds were strong, although not as strong as recent days, with speeds of up to 60mph seen across the north. A yellow weather warning for wind remained in force for northern/northeast Scotland until 6pm. Elsewhere, it was a largely dry for most with showers affecting north and central Scotland and Northern Ireland throughout the day. There were clear spells for eastern, central and southern England throughout the day. Wales and southwest England experienced more cloud however there were breaks in the cloud to give some clear spells. It remained a windy day for most of the country with the windiest conditions recorded in Highlands. The wind reduced through the evening while the amount cloud increased, and a band of rain moved into Northern Ireland.

### Summary of the UK Weather for Wednesday 02 February 2022

The night started wet with rain and drizzle for Northern Ireland and gradually this tracked to western Scotland by the early hours, slightly heavier here, as fronts pushed southeastward. Winds were less strong than previous nights, though remained gusty for parts of Northern Ireland, northwest England, Wales and parts of southwest Scotland, easing by morning. Elsewhere, it was a dry night with patchy cloud, though a scattering of heavy showers out towards northwestern Scotland. A largely cloudy day for many with some cloud breaks and sunny spells in the east during the morning and also to the lee of high ground and across the south during the afternoon. Outbreaks of rain and drizzle moved east through the affecting Northern Ireland, northern England and southern Scotland. While heavier rain moved in from the west affecting north and northwest Scotland during the afternoon and into the evening. Elsewhere remained largely dry, although showers moved across the southwest during the evening. It was less windy than on Tuesday although remaining windy in the Highlands.

This day's summary created 10/02/2022 03:03

### Summary of the UK Weather for Thursday 03 February 2022

Thursday started wet for most as heavy rain from the west tracked over north and northwest Scotland. Meanwhile light, scattered showers moved across the southeast of England and Wales, however these became more concentrated over the Pennines and northwest England, and heavy over Northern Ireland towards dawn. Winds made a strong accompaniment to the rain, specifically over northwest Scotland but remained light in the south. The first half of the day brought rather benign conditions for most with showers continuing through parts of Scotland and northern England. Elsewhere experienced sunny spells through the morning. By midday the effects of the southward sinking cold front began to impact much of the UK as a band of thick cloud pushed eastward across the country. The cold front eventually made landfall in parts of Northern Ireland and western Scotland bringing heavy rainfall and strong gusty winds to affected areas. By nightfall this cold front reached the border regions and pushed into England, bringing a drop in temperature for northern Scotland. It was a generally mild day ahead of the cold front.

This day's summary created 11/02/2022 03:03

### Summary of the UK Weather for Friday 04 February 2022

The southward sinking cold front continued to impact the UK. A band of locally heavy rain moved with the front, impacting northern and central England and Wales during the small hours, before continuing south and reaching the southwest at dawn. Showers followed the cold front and mainly impacted northwest Scotland and Northern Ireland during the early hours. It was windy for many as the front moved and across northwest Scotland. Through the morning the cold front continued to push southeastward eventually clearing the UK by midday. Once the cold front passed, many areas experienced clear and bright conditions and sunny spells before the arrival of the showers. These showers continued to effect Northern Ireland, Scotland and the north of England through the morning pushing into the rest of the UK by mid-afternoon. The driest conditions were experienced in south eastern parts of the UK where showers were limited. It was blustery for most with the strongest wind gusts experienced in northern Scotland. It was a cool day with the cold accentuated by the winds making it feel rather bitter.

This day's summary created 12/02/2022 03:03

### Summary of the UK Weather for Saturday 05 February 2022

Low pressure remained to the north of the UK. It started off showery for Northern Ireland, northwest England and north and west of Scotland. A band of rain associated with a warm front began to push in from the west, resulting in locally heavy rain affecting Northern Ireland, Scotland and northern England by dawn. Some showers also affected the southwest at dawn. Elsewhere remained largely dry. It was cloudy for most with some clear spells across Wales and central and southern England. The rain continued through the day for many as the frontal system continued to move southeastwards, with most of Wales and the northern of England also affected by midday, when the rain for northern Scotland also turned showery at times wintry over higher ground. The early clearer spells for southeast England lasted through the morning, before cloud started to build in. It was a windy day for most, particularly in coastal areas and in the north. The rain continued into the evening, affecting Wales and the southwest, while the showers continued to move south.

## Daily Weather Summary for Sunday 06 February 2022

This day's summary created 13/02/2022 03:03

### Summary of the UK Weather for Sunday 06 February 2022

An unsettled night for many due to an area of low pressure passing to the north of the UK. This brought extensive frontal cloud and persistent rain to much of England and Wales. The heaviest rain was experienced in northern England before pushing into Wales and the Midlands. Scotland and Northern Ireland had showers for much of the night, some locally heavy and wintry over high ground, particularly in Scotland. Some dry, clear interludes interspersed the showers giving colder temperatures in northern parts. Winds were strong throughout with some coastal gales along western coast lines. Temperatures remained mild in the south and colder in the north. The southeast saw heavy rain in the morning, as the cold front cleared the south coast, leaving widespread locally heavy showers, which were wintry in the north and over some high ground, interspersed with dry and bright conditions. The winds remained strong for most, with some coastal gales, especially in the west and along the Irish Sea. The showers and winds eased for most into the evening, leading to a generally clear night.

This day's summary created 14/02/2022 03:03

### Summary of the UK Weather for Monday 07 February 2022

A ridge of high pressure controlled the weather over the UK through the night, bringing settled conditions. With clear skies and winds easing, it turned cold in some places with a frost. It remained dry but Northern Ireland experienced some light rain and drizzle initially. Towards dawn the impacts of a low pressure system began to affect Scotland and Northern Ireland, increasing cloud cover and bringing some light rain and drizzle. A warm front moved east through the day bringing patchy light rain and drizzle, most significant on western upslopes in Southwest England, Wales, Northern Ireland, Northern England, and Scotland. After a cold and frosty start for some, temperatures were quick to rise, becoming mild as the warm front moved through. It was sunny in the east and southeast before the front arrived, and once it had cleared there were some sunny spells. The cold front arrived into the far northwest later, moving into the Scottish mainland through the evening, with some heavier rain. Showers followed into the Western Isles.

### Summary of the UK Weather for Tuesday 08 February 2022

A band of rain slowly moved southward across Scotland and Northern Ireland as a warm front crossed the UK through the early hours of Tuesday. The north of the UK was colder and saw some showers whereas, in contrast, the south was drier and warmer although there was widespread cloud. Winds were generally moderate for most although some gale force winds were seen across parts of the far northwest. Through the daytime, a weak weather front remained stationary stretching through Ireland and into Northern England. Some light rain and drizzle from this front affected the western upslopes of the Pennines in particular. To the south of this, it was mild and mostly cloudy. To the north of the front, it was colder, with showers affecting western Scotland, these wintry over the mountains. It was also windy, particularly in the north. There were some long sunny spells for eastern Scotland and the central belt, and eastern England at first.

This day's summary created 16/02/2022 03:03

### Summary of the UK Weather for Wednesday 09 February 2022

The north of England experienced some heavy rain into the start of Wednesday, with Northern Ireland and Wales experiencing lighter showers, which slowly sank south, and eased, through the small hours. Scotland also saw some widespread showers, which were wintry in places, particularly over the hills. Ice patches also developed, and winds were strong to gale force. Southern regions of England remained more settled with mostly dry and mild conditions along with widespread cloud. The showers eased in intensity throughout the morning, remaining scattered over western UK, with southeast England remaining dry. Into the afternoon, a passing cold front formed a band of rain across the south of England, as well as thick cloud cover, slowly moving southwest and lingering into the evening. Elsewhere saw persistent cloud, except eastern Scotland, Northern Ireland and northern England, where the cloud cover was more patchy, allowing for some sunny spells. There was a noticeable north/south temperature divide, with southern areas reaching double figures and Scotland remaining closer to zero.

### Summary of the UK Weather for Thursday 10 February 2022

A cold front, which had been lingering for a few days by this point, was slowly clearing away from southern England through the early hours, bringing some light rain and drizzle to southern and southwestern England. To the north of it, a large shield of frontal cloud covered the Midlands and Wales. Clearer, but showery weather affected Northern England, Northern Ireland and Scotland, the showers wintry over hills. Through the early hours, a small but compact area of low pressure approached western Scotland, enhancing rainfall, and bringing very strong winds. The cold front had cleared the UK by midmorning, leaving southern areas dry with patchy cloud and sunny spells. Wales, the Midlands and far southwest England still experienced scattered showers, whilst Scotland, Northern Ireland and northern England bore the brunt of the low pressure and associated occluded fronts. This resulted in heavy rain and wintry showers for most, as well as strong winds, with maximum gusts of around 70 mph. Temperatures were mild for most.

This day's summary created 18/02/2022 03:03

### Summary of the UK Weather for Friday 11 February 2022

It was a much quieter and more settled start to the day compared with preceding days. Other than a few showers in western Scotland, Wales, and the Liverpool Bay area, there were lengthy clear spells, particularly in the east where it turned cold and frosty, with the coldest temperatures in Scotland where there was snow cover. By dawn, it had turned cloudier in Northern Ireland, and many other western areas of the UK, as the next set of weather fronts and associated low pressure moved closer. An occluded front slowly moved its way across the UK throughout the day. Many areas were clear through morning but as the day progressed, cloud cover gradually increased. However, there were still some clear spells to be found in some areas, such as the southwest and southeast of England. Most of the country was dry throughout the day, but a band of rain began to move across Northern Ireland and western Scotland by late afternoon and continued moving east, affecting northwest England by midnight.

## Daily Weather Summary for Saturday 12 February 2022

This day's summary created 19/02/2022 03:03

### Summary of the UK Weather for Saturday 12 February 2022

A large area of low pressure was travelling east towards the UK throughout early hours, bringing occluded fronts to the western coast and central UK. These fronts brought associated rainfall, with Scotland and Northern Ireland experiencing the heaviest precipitation, and extensive cloud cover for most. Central England and Wales had scattered showers until dawn, when the associated rain band reached Wales, elsewhere remained dry. There was some sleet over higher ground in Scotland. Temperatures remained mild under the frontal cloud and precipitation, with the coldest temperatures in southeast England, and Scottish high ground. Many areas started off cloudy as several occluded fronts slowly moved across the UK, apart from the southeast which was largely fine and dry until later on in the evening. There were plenty of showers in Scotland, Northern Ireland and Wales throughout the day, and a band of drizzle moved over the southwest peninsula around midday. Winds started light, but progressively strengthened through the day. As midnight approached, most of the rain cleared, but the country remained cloudy.

This day's summary created 20/02/2022 03:03

### Summary of the UK Weather for Sunday 13 February 2022

Low pressure remained to the north of the UK, bringing associated fronts travelling east throughout the early hours. Frontal precipitation covered most of the UK, with scattered showers throughout central England and Northern Ireland, and heavy rain in southern Wales and Scotland. A band of heavy rain moved southwest over the UK by dawn, bringing strong winds to the southwest, while the southeast remained mostly dry with extensive cloud cover. Scotland also experienced sleet over higher ground. With a second low pressure centre emerging from the west, further unsettled conditions continued for the rest of the day. As this centre moved further inland, a widespread band of rain pushed its way northeastwards, bringing wet conditions to many areas of the west and north of the UK. Through the day, this rain extended its cover towards western areas. The evening saw gales to northern and western regions.

This day's summary created 21/02/2022 03:03

### Summary of the UK Weather for Monday 14 February 2022

A low pressure system sat over the north sea, which dominated the weather affecting the UK throughout the small hours. There was extensive cloud cover across the country, apart from a clear patch over Cornwall which slowly spread west as dawn approached. A frontal band of rain slowly tracked its way north across the southeast of England and another band travelled south across Scotland, Wales and Northern Ireland, while some patchy showers moved over the southwest peninsula from the Atlantic. With the low pressure centre remaining close to the UK, decaying fronts brought showers during the afternoon - at first to the north of England, before heading south eastwards, where central and eastern locations received rain. A scattering of showers lingered following the passing of the front, however most experienced a drier afternoon overall. Into the evening, these showers mostly died out and with the approach of clearer skies, a touch of frost was experienced in places.

This day's summary created 22/02/2022 03:03

### Summary of the UK Weather for Tuesday 15 February 2022

The morning began largely dry and clear for most of the country, apart from Scotland and Northern Ireland which were overcast. A frontal system arrived from the Atlantic and brought with it a bank of cloud which covered the entire UK by sunrise. The front also brought a band of precipitation, heavy at times particularly over high ground, which first made landfall in Northern Ireland and Scotland, and reached northern England and Wales by dawn. Later, the band of rain cleared southeastwards with showers followed by clearer intervals in Northern Ireland and western Scotland, it then became clear across Scotland and Northern England. Cloud and rain lingered over Wales and southern England for the morning. Into the afternoon, while Scotland continued to see showers and brighter spells, the rain pushed southeastwards towards the continent. This led to a drier and clearer period from the northwest to the southeast. In the late afternoon, cloud and further rain arrived from the Atlantic, bringing further wet and windy conditions to the UK.

## Daily Weather Summary for Wednesday 16 February 2022

This day's summary created 23/02/2022 03:03

### Summary of the UK Weather for Wednesday 16 February 2022

The synoptic situation on Wednesday was unsettled, as multiple low pressure centres occupied locations close to the UK. Frontal systems brought a swath of rain, mainly light, across the UK, with only small pockets of central England and Northern Ireland remaining dry. Through the small hours, this rain band dissipated, leaving behind a mostly cloudy sky. Through the morning, as Storm Dudley approached from the Atlantic, the UK became very windy nationwide where the northern part saw the frontal rain push in from the west, covering Northern Ireland and western Scotland at first, then the whole of Scotland and northern England. Wales and parts of southwest England also saw a band of rain later in the morning as the storm brought in some milder air. In the afternoon, as Storm Dudley made its way through northern Scotland, further rain pushed in and spread to much of the UK, except to the far southeast. Winds also further strengthened. Into the evening, clear spells developed in central and southern areas as rain cleared southeastwards, whilst the north and west remained showery.

### Summary of the UK Weather for Thursday 17 February 2022

It was a rather unsettled start to Thursday, with the events of Storm Dudley from the previous day remaining impactful. This low pressure edged further eastwards through the small hours, however winds remained high at first. Many scattered showers across England, Wales and Northern Ireland began to dissipate, whilst areas of central and western Scotland continued to see rain through the morning. Sunny spells developed by late morning although some showers remained, mostly in the north and west where some hill snow fell. A band of lighter rain crossed south and central England through the afternoon. Gusty winds associated with storm Dudley eased through the day. Rain reached the southwest by early evening and moved north, turning to snow in the process. Winds began to increase into the evening, particularly in the southwest where gale-force speeds developed as storm Eunice moved eastward.

### Summary of the UK Weather for Friday 18 February 2022

Storm Eunice rapidly approached the UK through the early hours. Bands of rain pushed northeastwards from the west through the night, giving a wet start for most of the UK, except for northern Scotland, which stayed largely dry. Winds also further strengthened into the morning. The most significant impacts of the storm were the provisionally record-breaking winds seen across the UK which developed from the southwest and the widespread snowfall across northern England and southern Scotland during the day. Winds were most impactful across the south. A red wind warning was also issued for the London area for the first time. A provisional record of gusts at 122mph was recorded at The Needles, Solent. Widespread damage and disruption was seen across the UK with damage to infrastructure, buildings and transport. There were mass power outages, especially across the southwest. Heavy rain tracked eastward throughout the day, following the path of the storm. Winds slowly eased into the evening, although remained strong. Wintry showers continued in the north with icy patches developing.

## Daily Weather Summary for Saturday 19 February 2022

This day's summary created 26/02/2022 03:04

### Summary of the UK Weather for Saturday 19 February 2022

With Storm Eunice moving away most in the UK experienced slightly calmer weather. Although winds remained strong, with further showers and rain affecting the northern UK, icy patches formed over high ground. Wales and southwest England also saw a few patches of showers as well, whereas central and southeast England saw some dry and clearer spells. The morning started off cloudy for many, and wet for areas of the southwest, Wales and Northern Ireland, as a frontal system moved east from the Atlantic. As the day progressed the rain and cloud moved east too, reaching central and southern England by the midday as the band of rain expanded. Around mid-afternoon, the rain band and cloud cleared the east coast of the UK, allowing for a brief clear and dry spell before the next bank of cloud and rain moved in from the west during the evening, which covered most of the country by the end of the day.

## Daily Weather Summary for Sunday 20 February 2022

This day's summary created 27/02/2022 03:03

### Summary of the UK Weather for Sunday 20 February 2022

Another unsettled start to Sunday with widespread rain which spread from the west. This was heaviest in the north and west, particularly over higher ground, but relatively patchy in the south. Scotland saw some snowfall, again, mainly over higher ground. Parts of the southeast stayed dry through the early hours. Winds remained strong with some gale force winds seen around coastal areas. Temperatures remained mild. The unsettled conditions from the early hours continued for the rest of the day as Storm Franklin was named by the Met Office this morning. A cold front moved east, first over Northern Ireland, then over England and Wales through the afternoon. The cold front was accompanied by strong winds, and often squally conditions particularly along its leading edge where some line convection occurred. It also brought a large band rain, which was heavy at times, especially in Northern Ireland and northern England. This rainband was followed by an area of less organised showers, which covered most of the country by midnight.

## Daily Weather Summary for Monday 21 February 2022

This day's summary created 28/02/2022 03:03

### Summary of the UK Weather for Monday 21 February 2022

A band of heavy squally rain crossed the UK in a south easterly direction through the early hours of Monday as Storm Franklin tracked east. The north of the UK experienced higher rainfall amounts whilst the south experienced showers. Winds were very strong, particularly around coastal regions, where gusts of over 80mph were recorded. Some wintry showers were seen over higher ground before rain eased toward dawn.. Storm Franklin continued to move southeast across England during the day. The low centre remained in the North Sea as it moved while occluded fronts brought heavy rain to northwest England and the West Midlands during the morning. Strong winds affected England, Wales and Northern Ireland throughout the day. Showers continued across the southeast as the occlusions cleared the southeast during the afternoon. The southwest remained largely dry with sunny spells between the cloud breaks whereas the east and parts of Scotland saw showers throughout the day.

## Daily Weather Summary for Tuesday 22 February 2022

This day's summary created 01/03/2022 03:04

### Summary of the UK Weather for Tuesday 22 February 2022

A frontal system moved over the UK from the Atlantic during the early hours, bringing with it plenty of cloud, squally winds and a band of rain, which was particularly heavy along the leading edge of the cold front, and covered Scotland and Northern Ireland by dawn. Despite this, most of the country remained dry apart from odd patchy showers which mostly affected western areas. Some lightning was observed in western Scotland. A low pressure system moved eastwards across the country. The cold front brought a band of heavy rain to Scotland, northern England and Wales during the morning. The cold front decayed as it moved south, bringing showers to the south of England before clearing the southeast in the afternoon. Showers lingered for western Scotland, Northern Ireland and northwest England throughout the day. Elsewhere there it was largely dry with sunny spells. It was windy along coastal areas, with the windiest conditions across northwest Scotland. A largely dry evening for many however there were scattered showers across Scotland.

## Daily Weather Summary for Wednesday 23 February 2022

This day's summary created 02/03/2022 03:02

### Summary of the UK Weather for Wednesday 23 February 2022

A low pressure system sat to the northwest of the UK through the early hours, resulting in rather benign weather for most of the country. Eastern areas remained largely dry and cloud free, whereas western areas became progressively cloudier through the morning as cloud rolled in from the Atlantic. The most interesting weather was in Scotland, where there was persistent rain in many areas as well as some snow at higher elevations. A cold front sinking slowly south from Scotland brought rain, heavy at times, and snow at higher levels while showers followed. Ahead of the front lighter showers were widespread for western areas through the day, moving slightly further east during the afternoon, but it remained dry for many eastern areas ahead of the front. This front continued to move south through the evening and night, reaching the southwest and the Midlands by midnight. It was windy for many, particularly along Scottish coasts and northern England, as well as along the Irish Sea. Temperatures dropped behind the front, leading to a cold night.

This day's summary created 03/03/2022 03:03

### Summary of the UK Weather for Thursday 24 February 2022

It was an unsettled start to the day with low pressure to the north of the UK. A cold front moved southeast during the early hours bringing a band of heavy rain to Wales, East Anglia and the southwest. Showers followed the front as it moved towards the southeast. An occlusion which started across northwest Scotland moved southeastwards during the small hours bringing snow to many areas including the Central Belt with the highest accumulations over mountains. The low pressure to the northeast of the UK brought windy conditions for most, particularly northwest England and northern Wales, and western Scotland. The cold front cleared the southeast through the first half of the morning, bringing heavy rain. Showers followed for all parts, these heavy at times, with hail in the south and snow in the north, particularly on higher ground. There were bright or clear spells between the showers, the best of these in the southeast in the evening. The showers for Scotland and northern England eased through the evening, but did not clear completely, and it remained windy for many.

This day's summary created 04/03/2022 03:03

### Summary of the UK Weather for Friday 25 February 2022

Low pressure sat to the northeast while high pressure was situated to the southwest of the country. There were a number of occluded fronts positioned across the country which resulted in showers for Scotland, Northern Ireland, northern England and northern Wales. These showers were wintry in places, mainly over higher ground, and cleared towards dawn. Southern areas remained largely dry with clear spells. It was a windy start to the day for many, but the winds started to ease towards dawn. Friday was a fine day for many, with lots of sunshine for most areas of England and Wales. There was some fair-weather cloud around, and there were a couple of showers in the North Midlands. A warm front approached Scotland and Northern Ireland through the day, with cloud building ahead of it, and some rain arriving into western Scotland and Northern Ireland around lunchtime; this moving eastwards through the afternoon. After a chilly start with a frost in places, temperatures rose to average or just above for many.

This day's summary created 05/03/2022 03:03

### Summary of the UK Weather for Saturday 26 February 2022

An area of low pressure between Iceland and Greenland brought strong winds to the northwest half of the UK, while in the southeast, high pressure saw much slacker winds. Cloud mostly affected the northwest, as weather fronts and widespread but generally light showers affected Scotland, falling as snow over hills. The southeast saw clearer skies and drier conditions. Under the clear skies, it was colder for the southeast than the north. Scotland saw some patchy light rain throughout the day, mainly on western hills, but there was some rain further east in Scotland in the morning. Elsewhere, after a cold and frosty start, it was dry and fine, with some long sunny spells for England and Wales, between the fair-weather cloud. It became breezier than Friday however, with gusts of around 30 mph widely, but these getting stronger towards the west, with gusts of around 60-70 mph in the Western Isles.

### Summary of the UK Weather for Sunday 27 February 2022

Through the early morning, a cold front moved slowly eastwards affecting western Scotland, bringing cloud and light rain or sleet. Elsewhere, the early hours were dry and clear, for the majority of people. It was windy through the first part of the day, particularly for coastal areas and in the north, with mountain waves for many areas, especially early on. The strongest winds were in western Scotland. Fairly benign weather continued through the rest of the day as most of the UK stayed dry with long sunny spells. The southwest saw some light drizzle later in the afternoon. Winds generally eased although the northwest became breezier again. A band of heavier rain approached from the west towards midnight.

This day's summary created 07/03/2022 03:03

### Summary of the UK Weather for Monday 28 February 2022

The clear skies of the previous day moved away as a more active weather front moved in off the Atlantic, catching up a decaying cold front which was erratically moving eastwards. As a result, areas of light to moderate intensity rainfall moved southeastwards through the night, affecting most parts of the UK as they did so. Winds were light to moderate for most. The temperatures fell lowest in the clear skies early on in the night. Rain became more widespread throughout the morning as a front progressed east across England and Wales. Rain became heavy at times across western parts by the afternoon whilst parts of the southeast remained dry and occasionally bright. Northern Ireland and Scotland also saw bright intervals between showers. Rain mostly continued to clear eastward through the evening as skies cleared allowing for a widespread frost and some fog patches to form.

### Daily Extremes

<i>Highest Maximum</i>	<b>13.6°C</b> Santon Downham (Suffolk, 6mAMSL)
<i>Lowest Maximum</i>	<b>6.3°C</b> Dalwhinnie No 2 (Inverness-shire, 351mAMSL)
<i>Highest Minimum</i>	<b>9.6°C</b> Scilly: St Marys Airport (Isles Of Scilly, 31mAMSL)
<i>Lowest Minimum</i>	<b>-1.4°C</b> Malham Tarn (North Yorkshire, 381mAMSL)
<i>Lowest Grass Minimum</i>	<b>-5.1°C</b> Writtle (Essex, 32mAMSL)
<i>Most Rainfall</i>	<b>29.4mm</b> Birchgrove (West Glamorgan, 133mAMSL)
<i>Most Sunshine</i>	<b>5.9hr</b> Hastings (East Sussex, 45mAMSL)
<i>Highest Gust</i>	<b>46Kt 53mph</b> Stornoway Airport (Western Isles, 15mAMSL) also Lerwick (Shetland, 82mAMSL) also Fair Isle (Shetland, 57mAMSL)
<i>Highest Gust (mountain)</i>	<b>96Kt 110mph</b> Cairngorm Summit (Inverness-shire, 1237mAMSL)
<i>Greatest Snow Depth at 0900 UTC</i>	No non-zero values.

mAMSL refers to station elevation in metres above mean sea level

### North Atlantic and Europe analysis charts and satellite images at 1200 UTC

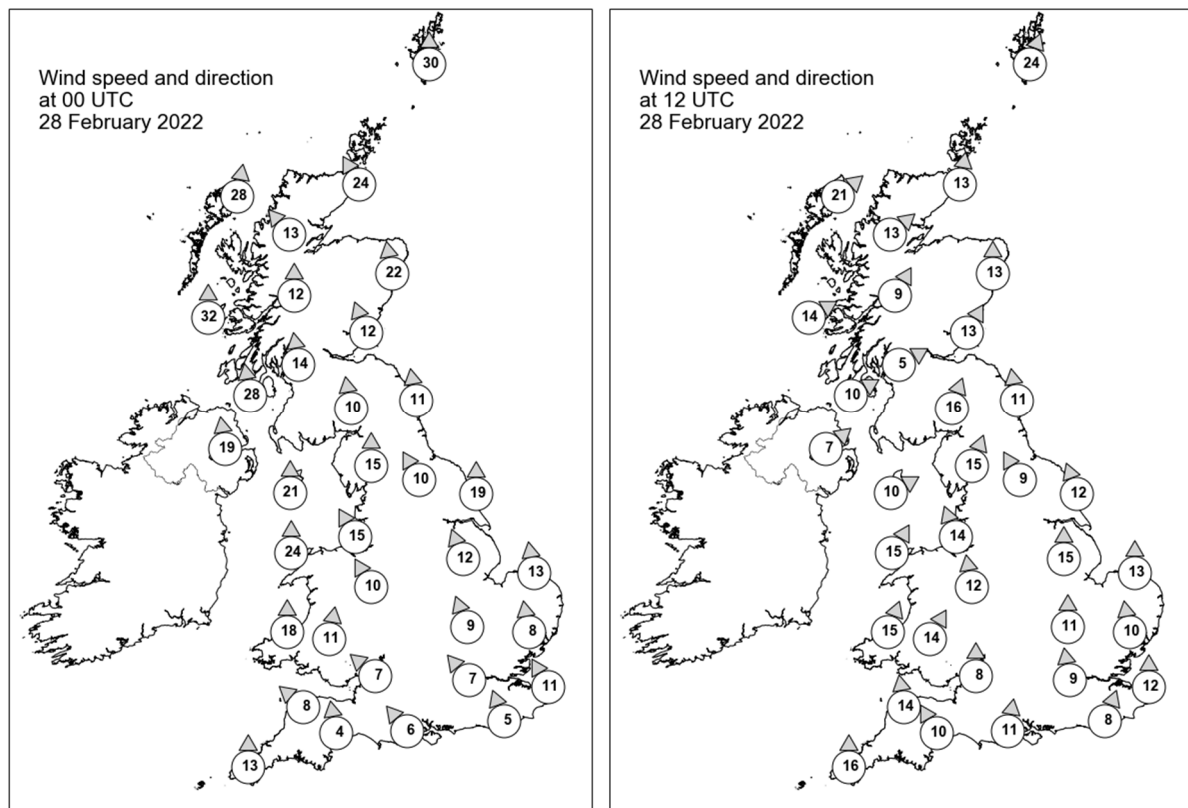

All satellite imagery copyright Met Office and EUMETSAT (European Organisation for the Exploitation of Meteorological Satellites). These show infra-red images from the geostationary MSG satellite. The rainfall rates are derived from both rain-radar and satellite data.

# Daily Weather Summary for Monday 28 February 2022

# Daily Weather Summary for Monday 28 February 2022

## Guidance Notes

UTC = Universal Coordinated Time. For the UK UTC is the same as GMT (Greenwich Mean Time).

National boundaries shown on the European station map are for illustrative purposes only.

### Daily extremes

- Daily extremes have been manually confirmed by Met Office Observations Quality Management as valid observations from the live database at the time of checking. However, more extreme values may still be possible if they occur after the time of production.
- Mountain stations above 500 masl are excluded from lowest temperatures, highest gust speeds and greatest snow depths at 0900 UTC. This is because they are not considered representative of low level areas.
- Counties quoted against each station are based on historical county boundaries pre-1974 and may not reflect current administrative boundaries.

### Analysis charts and satellite imagery

- The satellite imagery is infra-red imagery from the geostationary MSG satellite.
- The rainfall image is derived from satellite data from MSG and rain-radar data. This represents a snapshot of instantaneous rain-rates at 0000 UTC and 1200 UTC and so does not necessarily reflect daily accumulations in the rainfall station map.
- Any analysis charts or satellite images which are unavailable will be displayed as white space.

### Station maps

- The UK maps show station data for the same set of stations presented UK data table. These stations are selected to provide good spatial coverage across the UK; they represent only a fraction of the overall UK observing network.
- Wind speed maps show wind speed in Kt and direction both averaged over the hour up to the time of observation. 1 Kt = 1.151 mph.

### Hourly station data

- The data tables provide spot hourly observations from synoptic messages at 0000 and 1200 UTC. Missing data are denoted by '-'.

- Pressures are mean sea level pressure in hPa.
- For UK stations, Gibraltar and Jersey, the wind speeds and directions are both averaged over the hour up to the time of observation. However, for European stations wind speeds and directions are both averaged over a 10-minute period up to the time of observation.
- Wind speeds are in Kt. Wind directions are stored in the database every 10 degrees and have been converted to the nearest point of the compass. These give the direction the wind is blowing from, not to.
- Cloud amounts are in Oktas from 0 (clear) to 8 (overcast). 9 indicates sky obscured (eg by fog).
- Air temperature and dew point temperature are in Celsius.

### **Temperature maps**

- Daily maximum, minimum and grass minimum temperatures are in Celsius.
- The period for the daily maximum temperature on day D is defined from 0900 UTC day D to 0900 UTC day D+1.
- The period for the daily minimum and grass minimum temperatures on day D is defined as 0900 UTC day D-1 to 0900 UTC day D.
- On any given day D the minimum will typically occur in the early hours of the morning and the maximum in early afternoon.

### **Rainfall, sunshine and max gust speed maps**

- Daily rainfall is in mm from 0900 UTC day D to 0900 UTC day D+1.
- Daily sunshine is in hours from Kipp and Zonen CSD1 automatic sunshine records. Bright sunshine is defined as exceeding 120 W/m<sup>2</sup>.
- Max gust speeds are the daily max gust in Kt from 0000-0000 UTC

### **Snow maps**

- The day of snow falling map displays data from present weather sensors, showing stations which have recorded sleet or snow falling at any point in the day (0000-0000 UTC).
- The snow lying map shows level snow depth as recorded by the automatic snow depth sensors at 0900 UTC. These snow depth sensors do not record snow depth if this is less than 1cm.
- Snow depth sensors are normally operational from October to April, in the event of snow falling outside this period data availability may be limited.
- Snow maps will only be displayed if one or more of the selected stations on that date have recorded either snow falling or non-zero snow depths. If snow maps are not

displayed it is still possible that other stations in the network have recorded a day of sleet or snow falling or non-zero snow depth.
