Daily Weather Summaries for April 2022

If you have any questions or feedback about this product or wish to obtain further data please contact the Met Office.

This document contains daily weather summaries for each day of April 2022. The Met Office National Meteorological Library and Archive holds a continuous record of daily weather summaries or daily weather reports from 1860, and these daily weather summaries form a continuation of that series.

The purpose of each summary is to provide an overview of the weather conditions across the UK on that day, with the historical emphasis mainly based on observations from surface network of weather stations, although the format has varied over the decades. While the emphasis remains on observations from the surface network, the current daily weather summaries supplement these by including satellite and rain-radar imagery to provide a more complete overview. The current format of the daily weather summaries is as follows:

1. Text summary of the main characteristics of the weather during the day, written by an operational meteorologist in the Met Office operations centre.
2. Table of daily extremes for the UK for key climate variables including temperature, rainfall, sunshine and gust speeds.
3. Overview of the synoptic situation at 00 and 12 UTC comprising: analysis charts showing the surface pressure pattern and associated weather fronts; North Atlantic and European infra-red satellite images showing cloud-cover; combined infra-red and rain-radar images of the UK; maps of wind speed and direction at 00 and 12 UTC; observations of pressure, wind speed and direction, cloud cover, air and dewpoint temperature at selected UK and European stations in data tables.
4. UK maps of key climate variables from observing stations including maximum, minimum and grass minimum temperature, rainfall, sunshine, gust speed and snow.
5. Further guidance notes

If you spot any data errors or omissions in this product please contact the Met Office.

Daily Weather Summary for Friday 01 April 2022

This day's summary created 08/04/2022 03:03

Summary of the UK Weather for Friday 01 April 2022

Through the early hours an occlusion remained to the far South East, bringing rain and snow showers, along with some thunder & lightning at times. Further north along the east coast there were more showers, some locally heavy and wintry in more northern locations and on higher ground. A secondary occlusion fringed the northwest coast of Scotland bringing further rain here through the early hours. The rest of the UK experienced a rather dry and somewhat clear night with moderate winds. Throughout the day, the occlusion in the south east of the UK remained active but largely lingered offshore.

The occlusion in the far North West remained over western & central Scotland throughout the afternoon & evening, but progressed southwards over Ireland and into Wales in the evening, bringing a band of showers to the region. With arctic maritime air, showers along eastern coasts continued with isolated thundery outbreaks, spreading inland through the afternoon bringing wet & wintry conditions. Elsewhere remained cloudy with bright interludes. Winds remained strong on the south coast.

Summary of the UK Weather for Saturday 02 April 2022

During the early hours, the occlusion over the west of the UK made its way further southwards, leaving the bulk of the precipitation across Northern Ireland, Wales and the South West, with wintry outbreaks throughout. Light rain (frontal debris) was also observed across Scotland, along with some showers in the east. Along eastern/coastal England, generally light showers remained throughout the night. In central/ southern England, isolated areas of mist developed by dawn. Through the day, the zone of frontal debris took an enhanced region of showery rain and sleet southwards through the west of Wales and into Cornwall. Elsewhere, after a cold and frosty start, it was another showery day. Despite the showers being lighter and less frequent around coastal areas, more formed inland in the strengthening sunshine, the showers containing a mixture of rain, sleet, snow and hail. It was rather cool for the time of year, but felt a little warmer due to lighter winds.

Summary of the UK Weather for Sunday 03 April 2022

Overnight, it was a clear night for most, though intense and cold, wet weather from the arctic loomed over northern Scotland towards the small hours. There were also some light patches of rain over Manchester and parts of the northwest. Winds remained light elsewhere, though strongest with the incoming rain and snow. It was a cold and frosty start across England and Wales, but temperatures soon lifted in the sunshine. However, a zone of altocumulus covered some central areas, with a little light rain from this, but this cloud disintegrated through the morning. Cumulus formed across England and Wales into the afternoon, with a few light showers. Further north it was a different story. Thick cloud and outbreaks of rain arrived into northwest Scotland by lunchtime, steadily moving south through the afternoon. It was still cool for many, but not as windy.

Summary of the UK Weather for Monday 04 April 2022

Overnight, rain continued to push southeastward over Scotland and Northern Ireland, this was heavy at times and persisted towards the south throughout the early morning. Another frontal band pushed southeastward over western Scotland in the early morning, bringing continued wet weather to the region. Winds were strong and gusty at times in parts of the north and east, especially along coasts. Temperatures were rising from the northwest, although it was chilly in southern areas in the small hours. The unsettled conditions remained over the UK for much of the day as a low pressure centre remained centred off the northeast coast. This brought thick cloud and heavy rain to the southern half of England, the west coast of Scotland, and coastal areas of Wales. Elsewhere had a dry cloudy day with some isolated showery rain and drizzle. Temperatures were much milder than off late.

Summary of the UK Weather for Tuesday 05 April 2022

It was cloudy for all areas to start the day, with central and southern parts in the warm sector of the low pressure centred to the northeast. Fronts linked back across central areas to another low pressure situated south of Greenland. There was rainfall along these fronts, heaviest across western upslopes in northwest England and southwest Scotland. An occluded front lay ahead of this across northeast Scotland where it was colder, bringing snow to the hills and mountains. Through the daytime there was a marked contrast in conditions north to south, depending on which side of the front places were on. Northern areas saw a period of snowfall through the morning, with accumulations reaching 4 cm in Aberdeenshire. It turned back to rain through the afternoon however, but it was a cold day in the north with maximum temperatures just above freezing. In the south, in the warm sector, it was a pleasant and warm day, but breezy. Through the afternoon and evening, a cold front finally started moving southeast.

Summary of the UK Weather for Wednesday 06 April 2022

Through the early hours, a weak cold front moved southeast, with a band of cloud and light rain, reaching southeast England by dawn. A zone of persistent rain and hill snow moved away from the Scottish mainland by dawn but continued to affect Orkney. Behind the front, heavy showers affected Scotland, Northern Ireland, and Northern England. It was generally a windy, mild night, but cold in northeast Scotland. Any clear breaks were to the lee of high ground. A low pressure system sat to the northwest of the UK, bringing strong winds and unsettled conditions for many. There was plenty of cloud around, particularly in northern and southwestern areas, but also lots of clear spells inbetween. There was heavy rain in Scotland through the day, and a band of rain moved eastwards across Wales and England - later easing. There was over 1000 observed lightning strikes in the southeast during the afternoon as a trough moved through. Towards midnight, the low moved over Scotland, bringing further rain (with snow/sleet in far north) and strong winds for much of the UK.

Daily Weather Summary for Thursday 07 April 2022

This day's summary created 14/04/2022 03:03

Summary of the UK Weather for Thursday 07 April 2022

Through the early hours, a weak cold front moved southeast, with a band of cloud and light rain, reaching southeast England by dawn. A zone of persistent rain and hill snow moved away from the Scottish mainland by dawn but continued to affect Orkney. Behind the front, heavy showers affected Scotland, Northern Ireland, and Northern England. It was generally a windy, mild night, but cold in northeast Scotland. Any clear breaks were to the lee of high ground. A low pressure system sat to the northwest of the UK, bringing strong winds and unsettled conditions for many. There was plenty of cloud around, particularly in northern and southwestern areas, but also lots of clear spells inbetween. There was heavy rain in Scotland through the day, and a band of rain moved eastwards across Wales and England - later easing. There was over 1000 observed lightning strikes in the southeast during the afternoon as a trough moved through. Towards midnight, the low moved over Scotland, bringing further rain (with snow/sleet in far north) and strong winds for much of the UK.

This day's summary created 15/04/2022 03:03

Summary of the UK Weather for Friday 08 April 2022

Another occlusion (cold) progressed southeastwards in the north-westerly flow, bringing some bands of precipitation, some of this wintry, to Northern Ireland and Scotland. There were also scattered showers across the north of the country, with the odd thundery outbreak to the far north. In central parts of the country, it was largely dry with clear skies being seen in many places. Bands of cloud associated with the low pressure system in the southwest of the country pushed eastwards to give a cloudy night to the far south, and some rain to the far southwest before dawn. Under the clear skies temperatures dropped sharply. Into the day, the cloud and rain in the south and far southwest cleared eastwards through the morning, leaving a sunny day with showers for most. The showers in Northern Ireland and Scotland continued to progress southwards with some reaching the far southwest by the afternoon. Further widespread showers developed in Wales, northern and central England during the afternoon, while East Anglia stayed mostly dry. In the evening, inland showers gradually died out to give a clear night.

Daily Weather Summary for Saturday 09 April 2022

This day's summary created 16/04/2022 03:03

Summary of the UK Weather for Saturday 09 April 2022

Many areas of England and Wales started the morning with clear and calm conditions. In contrast, most of Scotland was cloudy, with many showers spread further south through the morning. Northern Ireland started off clear, but gradually became cloudier towards dawn. Winds came from the north, and were light in most areas, apart from high ground in northern Scotland where gusts of around 40 knots were observed. These northerly winds, when combined with widespread clear conditions, allowed temperatures to drop considerably. Into the day, sunny spells with showers were seen in many places. Showers and a band of cloud spread southwards from southern Scotland through the morning, reaching northern England and north Wales by midday. In the afternoon, showers became widespread in Scotland and many parts in England, especially along the eastern coast, whereas Wales started to experience some longer spells of sunshine as the showers eased into the evening. Through the day, Northern Ireland saw a few isolated showers and it was dry and fine in southwest England. Into the evening, widespread showers eased and became confined to far north Scotland. Clear skies were seen elsewhere.

Summary of the UK Weather for Sunday 10 April 2022

Early hours were benign for most areas of the country, with clear skies in many eastern and southern areas. As the morning progressed, a bank of cloud, associated with storm Evelyn out in the Atlantic, approached from the West, covering most of Scotland, Northern Ireland, Wales and Cornwall by dawn. Most areas stayed dry, with the only rain being in Northern Ireland and the far north of Scotland. Winds were light throughout the country. The clear conditions allowed temperatures to fall considerably low. Thin cloud affected most of the country through the day, with light rain affecting the far north of Scotland and northern Wales. Thicker cloud in Northern Ireland with rain, which was heavy at times, came from a weather front in the west, and moved off in the mid-afternoon. The cloud thickened across the country through the day and into the night, with light rain affecting more of western Scotland, Northern Ireland and northern England. Winds remained light through the day and strengthened in the evening.

Summary of the UK Weather for Monday 11 April 2022

An area of low pressure situated to the west of the UK. Several fronts pushed northeastwards through the early hours, bringing more cloud from the southwest and showers to parts of Scotland, north Wales, northern, eastern England, and Northern Ireland. These showers in Northern Ireland were heavy at times. The southern areas experienced a dry night, and clear spells were seen in the southeast at first. The weather fronts brought further cloud to many areas through the day, and rain to western Scotland, the Borders and the far north of England. A trough moved northeastwards through the day, bringing heavy rain to Northern Ireland, Cornwall, west Wales and northwest England. The far west of Cornwall saw lightning through the early part of the morning. By the end of the day, most areas had seen some rain, with lighter rain affecting Wales, the southwest and central England through the afternoon. Into the evening, while the rain remained in the north, the south and central became dry as the rain eased. Southwest England and part of Wales saw some isolated showers.

Summary of the UK Weather for Tuesday 12 April 2022

Low pressure continued to sit to the west of the UK, pushing fronts and troughs northeastwards across the country. The night started with mostly cloudy skies and light rain over the north and west. During the early hours, further cloud and outbreaks of showery rain pushed eastwards into Cornwall, Devon and Wales. There was a drier period towards dawn as rain in Northern Ireland and Scotland slowly cleared northwards. Another band of rain arrived in the far south by dawn, giving a wet start to the day. It was a cloudy day for most with early showers across the north clearing during the morning. A band of rain moved northwards from the southwest during the morning and reaching the Northern Ireland and central Scotland by late afternoon. Further showers affected the southeast and the midlands during the afternoon. Thunder and lightning was reported across southern Wales during the afternoon before moving towards the West Midlands in the early evening. Through the evening the rain eased across the south whereas it continued across Scotland, Northern Ireland and northern England.

Summary of the UK Weather for Wednesday 13 April 2022

Through the early morning areas of low pressure continued to sit to the west of the UK, and pushed weather fronts across the country, bringing rain, heavy at times to many areas of Scotland. There were also showers across Wales and Northern Ireland through the night, and lighter showers for the southwest. Many areas saw patchy cloud through the early hours, while eastern England had clearer spells. It was a cloudy start for most, with some clear spells initially for the southeast. The low pressure system over northeast Scotland slowly moved into the North Sea resulting in the rain easing across the northeast. Locally heavy showers affected the midlands, Wales, Northern Ireland and the southwest during the afternoon, these slowly eased by evening. There was sunshine between the showers, with the best across the southeast. Lightning was reported in the East Midlands during the early afternoon. Any lingering afternoon showers across the southwest and East Anglia cleared away during the evening leaving a largely dry night with clear spells for many. Low cloud approached the west coast towards midnight.

Summary of the UK Weather for Thursday 14 April 2022

The day started with patchy cloud for Scotland, Northern Ireland, northern and central England, and clear for the rest of the country. Through the early hours more cloud moved in from the west to Northern Ireland and western Scotland, before rain arrived in the early morning. There were light winds across the UK through the night. Lightning was reported in Devon and fog affected the south and east during the early morning. Throughout the morning, a warm front approached the western coast of the UK, bringing a slow-moving frontal rain band that moved over Northern Ireland, western Scotland, and slowly moving into northern England by noon. Elsewhere remained mostly dry, with some sporadic showers in the south, and extensive cloud cover with sunny spells throughout. The far southwest experienced mainly clear skies through the afternoon. The winds remained light throughout the day. Through the evening most areas remained dry with clear spells.

Summary of the UK Weather for Friday 15 April 2022

It was a dry start for many with patchy cloud and clear spells. Showers affected western Scotland initially before clearing away northeastwards during the early hours. An anti-cyclonic system sat to the west of Northern Ireland which resulted in cloud moving across western areas. The system moved northeastwards which brought showers to Northern Ireland and northwest Scotland as well as cloud to most of Scotland. Towards dawn mist and fog developed in the south and north Wales, which slowly cleared through the morning yet lingered on the coasts. The system continued northeastwards, which resulted in isolated showers across south Wales, southwest and northeast England, and southwest Scotland. The heavy band of rain over northeastern Scotland moved off the coast by the afternoon, however Northern Ireland continued to experience heavier showers and rain spells as well as cloud. Elsewhere experienced a mix of cloud and sunny spells, southeast England had clear skies until late afternoon. Showers largely faded through the evening, however showers continued across western Scotland.

This day's summary created 23/04/2022 03:03

Summary of the UK Weather for Saturday 16 April 2022

Initially cloud and showers affected western Scotland, these cleared during the early hours. Elsewhere remained dry with variable amounts of cloud and clear spells. Low cloud affected coastal areas during the early hours especially eastern Scotland, Northern Ireland, and southwest England. Towards dawn, fog developed in northwest and southwest England and north Wales which slowly cleared through the morning. Winds remained light through the early hours. The day remained dry for all except western and northwestern Ireland. Low cloud and fog cleared as the day brightened up throughout the morning. Patchy cloud lingered at low levels over Ireland, Scotland and parts of the Midlands. The best of clear skies were found towards the east and southeast of the country. It was slightly breezy towards north and western coasts. Cloud and spells of rain developed over Northern Ireland and western Scotland throughout the evening and overnight, however elsewhere remained dry with clear skies, although a few isolated fog and mist patches were present.

Summary of the UK Weather for Sunday 17 April 2022

A cold front sat to the west of the UK, slowly moving east throughout the night, bringing a band of heavy frontal rain to Northern Ireland and northwestern Scotland. Elsewhere remained dry, with some isolated showers in the Midlands and northern England, with extensive cloud cover. Towards dawn, clear spells began to form, mainly throughout England, and widespread mist and fog patches developed. Winds remained light overnight. Early mist and fog patches soon cleared leaving a fine and dry day. The east remained clear, giving the best sunshine, whereas Northern Ireland was cloudier with rain, occasionally heavy. Early cloud and rain in western and northwestern Scotland cleared into the afternoon. West Wales and the far southwest of England remained cloudy with some rain at times. Overall, a warm day in the sunshine, but breezy, feeling slightly colder in the North.

Daily Weather Summary for Monday 18 April 2022

This day's summary created 25/04/2022 03:03

Summary of the UK Weather for Monday 18 April 2022

Two cold fronts moved slowly northeastwards overnight, bringing 2 frontal rain bands that steadily lost intensity through the early hours, followed by scattered showers, covering Scotland, Northern Ireland, northern England and northern Wales. Elsewhere remained dry. By dawn, some scattered showers reached the far southwest coast. There were few patches of clear skies throughout the early hours that brought lower temperatures and rogue frosts, however most areas experienced cloud cover. Winds remained light. The low pressure centre located to the northwest of the UK brought two trailing cold fronts slowly across Scotland through the morning. This meant there were some scattered showers across this area, with elsewhere seeing variable cloud during this time. Into the afternoon, a trough over Wales and the southwest allowed for isolated showers. However, locations to the southeast saw light wind speeds and periods of clear skies, allowing for warmer temperatures. Evening showers mostly eased, leaving many areas with clear spells. However, showery rain persisted in the northwest.

This day's summary created 26/04/2022 03:03

Summary of the UK Weather for Tuesday 19 April 2022

Overnight, several occlusions brought wet conditions, sometimes heavy to northwestern Scotland and parts of western Ireland, with a low-pressure system located just to the northwest of Scotland. High pressure pushed in from the south, allowing largely clear and dry conditions overnight for southern regions of the UK and Wales with some patchy cloud in the southwest. Though a trough carried eastwards over the northeast of the UK during the small hours, bringing the odd patchy shower to the Midlands and central parts. Through the morning, trailing occluded fronts brought scattered showers to areas of Scotland and Northern Ireland. Into the afternoon, these showers became more widespread to locations across Wales and isolated areas throughout the length of the UK. However, most saw a dry and rather cloudy day. It felt cooler than of recent, and pleasant in sunnier breaks. The daytime showers headed eastwards and became increasingly isolated into the evening. It also became somewhat cloudier and breezier across most of the south. Sussex.

Summary of the UK Weather for Wednesday 20 April 2022

Overnight, a trough lingered around the southwest area, bringing wet weather, sometimes heavy rain to parts of south Wales, Devon and Cornwall as the line moved eastwards gradually. By the small hours, little precipitation was experienced around these parts. Elsewhere, it remained dry and clear, with the warmest temperatures in the southeast. It remained a little windy in northern parts, especially along eastern coasts. A ridge of high pressure continued to dominate the weather across the UK through the day. This kept a low pressure system at bay off the coast of Ireland. The high pressure brought fine and dry weather to the UK through most of the day, with good sunny spells to most and warm conditions in central and southern locations and feeling cooler further north. A band of cloud pushed northwards through the day bringing cloudy conditions to some parts. Through the day the low pressure system to the west continued to push westwards, bringing some rain to far western parts of Northern Ireland by dusk.

Summary of the UK Weather for Thursday 21 April 2022

The low pressure centre that has been sat to the northwest of the UK over the previous few days was showing signs of decay, heading into Thursday. It was a rather benign start, no pressure fronts headed over the land, leading to a dry early morning for most. However, it was rather cloudy, as an occluded front lingered to the west of Northern Ireland, bringing a band of cloud to western parts. High pressure continued to dominate the weather throughout the UK today, keeping the frontal features off the coast of Ireland. This brought fine and settled conditions with many experiencing plenty of sunny spells. Winds remained light and it felt warm and pleasant in the sunshine. Some cloud did linger in western parts through the first half of the day but burnt back to coastal locations by midday. West and northwestern parts retained clear periods, while low cloud in the east expanded westwards through the evening.

Summary of the UK Weather for Friday 22 April 2022

Heading into Friday, cloud began to build from the east during the small hours. It was rather breezy with the easterly winds increasing at times. No frontal systems passed during the early morning, with the location of the high pressure to the north and the low pressure to the south of the UK allowing for winds to pick up. High pressure continued to sit to the north of the UK, bringing generally easterly and northeasterly winds. The day started cloudy for most of England and Wales, except the far southwest, while Scotland and Northern Ireland had clearer skies. North Wales experienced rain to start, later spreading to the rest of Wales and the southwest of England. The rain and cloud moved westwards through the morning, by midday most of the north and east experienced sunny spells. By early evening, the cloud was mostly affecting southern Wales and the south of England. Through the early part of the night, high cloud then moved west to reach the east coast. Winds were brisk through the day at times, particularly in coastal areas.

Summary of the UK Weather for Saturday 23 April 2022

With high pressure dominating over the UK the weather through the earlier hours remained dry and settled. Northern regions experienced some clear spells while further south a band of thick cloud remained stationary. This cloud affected the south coast of the England as well as much of Wales right through the night and the Midlands at times, bringing some light rain and drizzle for a short period. Some sheltered locations experienced some fog and low level cloud through the night. High pressure continued through the day, bringing easterly winds. In the morning, the best of any clear spells were in Northern Ireland, northern England and central Scotland, as well as parts of East Anglia. Cloud moved westwards and by lunchtime, many parts of the east coast had long clear spells, and small amounts of light rain affected the west Midlands and eastern parts of Wales, and later Cornwall. Northeast Scotland was cloudy through the day. Through the evening, cloud and some small light showers moved into southern England.

Summary of the UK Weather for Sunday 24 April 2022

Generally settled conditions observed in the early hours of Sunday. Predominantly clear skies over the UK, while a low-pressure system brought bands of cloud and light yet intensifying precipitation to southwestern England and the southern Welsh coast. Localised fog patches occurred in sheltered rural areas of central UK. Mainly moderate northeasterly winds, becoming breezy in coastal areas. Rather cold temperatures observed in the UK through the night, under clear sky conditions. It was a largely dry start to the day for many with variable cloud and sunny spells. Cloudy across the southwest with rain during the morning which moved westwards during the afternoon. Low cloud persisted across coastal areas in the north and east, and moved inland during the afternoon. Winds remained light for many although it was windy along the southeast coast. Any remaining afternoon showers across the southwest cleared into the evening. Elsewhere remained largely dry with variable amounts of cloud and clear spells.

Summary of the UK Weather for Monday 25 April 2022

Through the morning a high pressure system sat to the north and low pressure to the south of the UK brought mainly northerly to northeasterly winds, with light rain observed for eastern Scotland, the Scottish borders and northeastern English coast. In the early hours, Scotland was overcast with cloud which later extended towards many parts of northern England and some parts of Wales. The best of any clear spells were in the south and southwest.

Generally cool for most, with overnight temperatures dropping below average. Patchy cloud continued to move across the UK for the rest of the day, bringing sunny spells to most areas and bands of showers across the southeast and parts of the north of England. Once these passed, the clouds cleared along the east coast, leaving clearer skies, particularly across East Anglia. Light winds remained northeasterly throughout the day.

Summary of the UK Weather for Tuesday 26 April 2022

High pressure remained to the northwest of the UK while low pressure was situated to the southeast through the early hours. It was cloudier across Scotland, Northern Ireland and northern England and light showers affected northeast Scotland. Elsewhere remained dry with clear periods. Low cloud and fog were reported across parts of East Anglia and the East Midlands during the early hours. The high pressure system remained fairly stationary to the north of the UK all day. A weak cold front slowly moved south over the country throughout the day, spreading cloud through the south and west. It also brought scattered showers to northeast England, which slowly dissipated through the day.

Summary of the UK Weather for Thursday 28 April 2022

A block of high pressure persisted throughout the early hours over Scotland and the north of England, bringing a clear and dry night to most across the country. The only areas to see much change throughout the night were the southwest and Wales, as an occlusion moving eastwards over Europe pushed some high cloud northwards. After a frosty start, it was another quiet day dominated by high pressure centred over the country. It was cloudy for many with the best of the sunshine across the Northern Irish coast. Some light rain affected northwest Scotland, but elsewhere remained dry. Into the evening, clearer skies became more extensive.

Summary of the UK Weather for Friday 29 April 2022

The blocking pattern from yesterday continued to dominate the UK weather system through the early hours, causing the weather to remain settled. Central and western parts had clear skies, with cirrus cloud clearing overnight, whereas Scotland and the southeast saw some stratocumulus which brought some scattered showers to these areas. Isolated mist and fog patches were reported in prone spots. Winds remained light. Everywhere was dry through the morning, except for Scotland and Northern Ireland, which saw patchy showers as a weakened cold front moved southeastwards. Northern Ireland also saw significant cloud cover moving in from the northwest, and stratocumulus dominated the sky through the day. These showers continued throughout the afternoon and into the early evening, but cleared into the night leaving clear skies for most.

Summary of the UK Weather for Saturday 30 April 2022

High pressure remained over the UK through the early hours, keeping it dry. However, a low pressure pushing in from the northwest brought frontal rainfall to Northern Ireland and parts of Scotland. In the centre of the high pressure the winds were light, but it became breezy in the northwest as the low approached. It was coldest across England and Wales under the clear skies, where a few fog patches developed. Where it was cloudy in Scotland, Northern Ireland and the far southeast, temperatures were milder. The low pressure system continued to move eastward into Scotland, spreading the band of frontal rain further southeast, reaching North Wales and Cumbria by midday. Most of England and Wales remained settled under the influence of high pressure, with light and variable winds. The south and east coasts had the best of the sunshine, with clear skies for most of the day, feeling significantly warmer than yesterday in the southeast. Into the night the rain continued to spread southeast, reaching most of Wales and northern England by midnight, persisting in Scotland and Northern Ireland.

Daily Weather Summary for Saturday 30 April 2022

Daily Weather Summary for Saturday 30 April 2022

None of the selected stations observed a day of sleet or snow falling or non-zero snow depth at 0900 UTC.

Guidance Notes

UTC = Universal Coordinated Time. For the UK UTC is the same as GMT (Greenwich Mean Time).

National boundaries shown on the European station map are for illustrative purposes only.

Daily extremes

- Daily extremes have been manually confirmed by Met Office Observations Quality Management as valid observations from the live database at the time of checking. However, more extreme values may still be possible if they occur after the time of production.
- Mountain stations above 500 masl are excluded from lowest temperatures, highest gust speeds and greatest snow depths at 0900 UTC. This is because they are not considered representative of low level areas.
- Counties quoted against each station are based on historical county boundaries pre-1974 and may not reflect current administrative boundaries.

Analysis charts and satellite imagery

- The satellite imagery is infra-red imagery from the geostationary MSG satellite.
- The rainfall image is derived from satellite data from MSG and rain-radar data. This represents a snapshot of instantaneous rain-rates at 0000 UTC and 1200 UTC and so does not necessarily reflect daily accumulations in the rainfall station map.
- Any analysis charts or satellite images which are unavailable will be displayed as white space.

Station maps

- The UK maps show station data for the same set of stations presented UK data table. These stations are selected to provide good spatial coverage across the UK; they represent only a fraction of the overall UK observing network.
- Wind speed maps show wind speed in Kt and direction both averaged over the hour up to the time of observation. 1 Kt = 1.151 mph.

Hourly station data

- The data tables provide spot hourly observations from synoptic messages at 0000 and 1200 UTC. Missing data are denoted by '-'.

- Pressures are mean sea level pressure in hPa.
- For UK stations, Gibraltar and Jersey, the wind speeds and directions are both averaged over the hour up to the time of observation. However, for European stations wind speeds and directions are both averaged over a 10-minute period up to the time of observation.
- Wind speeds are in Kt. Wind directions are stored in the database every 10 degrees and have been converted to the nearest point of the compass. These give the direction the wind is blowing from, not to.
- Cloud amounts are in Oktas from 0 (clear) to 8 (overcast). 9 indicates sky obscured (eg by fog).
- Air temperature and dew point temperature are in Celsius.

Temperature maps

- Daily maximum, minimum and grass minimum temperatures are in Celsius.
- The period for the daily maximum temperature on day D is defined from 0900 UTC day D to 0900 UTC day D+1.
- The period for the daily minimum and grass minimum temperatures on day D is defined as 0900 UTC day D-1 to 0900 UTC day D.
- On any given day D the minimum will typically occur in the early hours of the morning and the maximum in early afternoon.

Rainfall, sunshine and max gust speed maps

- Daily rainfall is in mm from 0900 UTC day D to 0900 UTC day D+1.
- Daily sunshine is in hours from Kipp and Zonen CSD1 automatic sunshine records. Bright sunshine is defined as exceeding 120 W/m².
- Max gust speeds are the daily max gust in Kt from 0000-0000 UTC

Snow maps

- The day of snow falling map displays data from present weather sensors, showing stations which have recorded sleet or snow falling at any point in the day (0000-0000 UTC).
- The snow lying map shows level snow depth as recorded by the automatic snow depth sensors at 0900 UTC. These snow depth sensors do not record snow depth if this is less than 1cm.
- Snow depth sensors are normally operational from October to April, in the event of snow falling outside this period data availability may be limited.
- Snow maps will only be displayed if one or more of the selected stations on that date have recorded either snow falling or non-zero snow depths. If snow maps are not

displayed it is still possible that other stations in the network have recorded a day of sleet or snow falling or non-zero snow depth.
