## Daily Weather Summaries for November 2018

**If you have any questions or feedback about this product or wish to obtain further data please contact the Met Office.**

This document contains daily weather summaries for each day of November 2018. The Met Office National Meteorological Library and Archive holds a continuous record of daily weather summaries or daily weather reports from 1860, and these daily weather summaries form a continuation of that series.

The purpose of each summary is to provide an overview of the weather conditions across the UK on that day, with the historical emphasis mainly based on observations from surface network of weather stations, although the format has varied over the decades. While the emphasis remains on observations from the surface network, the current daily weather summaries supplement these by including satellite and rain-radar imagery to provide a more complete overview. The current format of the daily weather summaries is as follows:

1. Text summary of the main characteristics of the weather during the day, written by an operational meteorologist in the Met Office operations centre.
2. Table of daily extremes for the UK for key climate variables including temperature, rainfall, sunshine and gust speeds.
3. Overview of the synoptic situation at 00 and 12 UTC comprising: analysis charts showing the surface pressure pattern and associated weather fronts; North Atlantic and European infra-red satellite images showing cloud-cover; combined infra-red and rain-radar images of the UK; maps of wind speed and direction at 00 and 12 UTC; observations of pressure, wind speed and direction, cloud cover, air and dewpoint temperature at selected UK and European stations in data tables.
4. UK maps of key climate variables from observing stations including maximum, minimum and grass minimum temperature, rainfall, sunshine, gust speed and snow.
5. Further guidance notes

If you spot any data errors or omissions in this product please contact the Met Office.

## Daily Weather Summary for Thursday 01 November 2018

This day's summary created 12/12/2018 18:22

### Summary of the UK Weather for Thursday 01 November 2018

Through the early hours, a band of rain moved eastwards across the UK, bringing heavy outbreaks of rain to many places. It cleared Northern Ireland first, where fog formed fairly quickly under the clear skies. By dawn, it had cleared Wales, the Midlands, northwest England and western Scotland, with a few fog patches forming here too. However, the heavy rain lingered across Eastern Scotland and eastern parts of England. The rain cleared only slowly eastwards from central and eastern England through the day, with some heavy and thundery bursts in places across the southeast during the morning. By late afternoon the rain was confined to easternmost counties, eventually clearing into the North Sea early evening. Elsewhere there were sunny spells and scattered shows across western parts, with the odd heavier shower over Northern Ireland and western Scotland in the afternoon. Temperatures were around average for the time of year.

### Summary of the UK Weather for Friday 02 November 2018

Through the early hours of the morning, there were clear skies across the majority of the UK which led to a cold start. There were a few mist and fog patches in prone locations, and the odd isolated shower in the northwest. Much of England and Wales had a dry and sunny day, with any showers in the northwest dying away by midday. Meanwhile it became increasingly windy over western Scotland and the west of Northern Ireland, with thickening cloud bringing some outbreaks of rain here by evening.

### Summary of the UK Weather for Saturday 03 November 2018

Saturday started with rain from a warm front affecting northwest England and Scotland. The corresponding cold front lay just to the west of Ireland. It was mainly dry elsewhere, with cloud in the west and clearer skies in the east. There was a southerly breeze across many parts, but a fresh to strong wind in the far northwest. Through the small hours of Saturday morning the rain across Scotland cleared to the east. The cold front moved into Northern Ireland and western Scotland and brought further spells of rain. It remained dry across much of England and Wales and an isolated air frost formed in parts of the southeast.

Through daylight hours the cold front cleared Northern Ireland and parts of western Scotland and brought rain into Wales and northwest England. It stayed dry across much of England, especially the southeast where there was some sunshine. For western parts of the UK there were some strong winds throughout Saturday, especially over exposed hills and coasts where winds reached gale strength at times.

During the night frontal rain continued to move across southern England, the Midlands and parts of northeast England. Some showers persisted in the northwest, although conditions were predominantly dry here. Southeast England remained dry and the strong winds in the west eased.

### Summary of the UK Weather for Sunday 04 November 2018

Sunday began with low pressure centred to the northwest of the UK and an associated cold front straddling the country from southwest to northeast. A trough lay across western Scotland. Through the small hours of the morning patchy rain and drizzle moved slowly southeastwards from western parts into southern and central England. The showery trough across western Scotland moved eastwards into the North Sea. By dawn the cold front had stalled across the southeast and it was rather cloudy across much of England. It was mainly dry with clear spells across Northern Ireland and Scotland. Cloud and rain cleared southeast England through Sunday morning and returned to affect western and central parts of England and Wales. It remained largely dry with sunny spells across northern parts of the UK with some strong winds for Shetland. Through Sunday night, further bands of rain ran up the western side of the UK, bringing some heavy bursts of rain across the West Country, Wales, and Northern Ireland. It stayed dry in the east and the north of the UK.

This day's summary created 12/12/2018 18:22

### Summary of the UK Weather for Monday 05 November 2018

Monday began with a low pressure centred over Biscay and a warm front straddled southwest to northeast across the UK. Much of the country lay under a light southerly air flow. During the early hours rain moved northwards across western parts, bringing some persistent rain into Northern Ireland and southwestern Scotland. Further east, low cloud, mist, and fog developed across much of England to give a murky, cloudy dawn. Daylight hours saw the persistent rain move into northern Scotland and then become patchier in nature. The rain cleared parts of southwest England and Wales. The mist and fog was slow to clear across England, although southern England saw some sunny spells. It was a mild day for many, especially in the south where the sunny spells lasted longest. By contrast northeast England remained rather cloudy and misty into the afternoon and it was cooler here. Monday evening was mostly dry across the UK although the patchy rain continued to affect Northern Ireland and northwest Scotland. Mist, fog, and low cloud redeveloped quite readily, in particular across eastern England.

### Summary of the UK Weather for Tuesday 06 November 2018

Through the small hours of Tuesday morning there were some showery outbreaks of rain across the southwest, Wales, Northern Ireland, and northern Scotland. It was mainly dry across the remainder of the country, although cloudy with widespread mist, with some quite thick fog across the south and east, in particular the Vale of York. It was quite a mild morning with temperatures quite a few degrees above the average for the time of year. The mist, fog and low cloud in the east and southeast lifted through the morning, and here it remained largely dry. Some brightness did break through the cloud. Further west it turned increasingly wet and windy as some heavy and persistent rain spilled in from the west. Through the evening the rain in the west became more widespread with coastal gales. Further east it stayed drier.

### Summary of the UK Weather for Wednesday 07 November 2018

Heavy rain and strong winds in southwest England and southwest Wales spread further north and east during the early hours of the morning. It became particularly wet in Northern Ireland and southwest Scotland. The night was mild due to all the cloud and rain. A band of heavy rain spread quickly east during the morning, clearing from all but northeastern Scotland by midday. The rain was followed by frequent heavy and blustery showers, with some strong winds along English Channel coasts through the middle of the day. There were some sunny spells between the showers, and by evening the showers began to ease from the west.

### Summary of the UK Weather for Thursday 08 November 2018

Thursday began with dry weather for many areas, and with some clear spells it was a cooler night than recently. However it was generally frost free with lows in mid-single figures. A band of rain arrived later in southwestern areas, with some showery rain developing across parts of Scotland. Through Thursday morning, the showery rain across southwest Scotland pushed northeastwards across the country and fragmented through the afternoon and into the evening. The rain cross southwest England pushed north into Wales and then up through much of the Irish Sea in to the afternoon, affecting adjacent coastal areas. For the rest of the day. Some of this rain was heavy at times, with frequent lightning towards the Isles of Scilly. It was breezy but dry elsewhere with some bright or sunny spells.

## Daily Weather Summary for Friday 09 November 2018

This day's summary created 12/12/2018 18:22

### Summary of the UK Weather for Friday 09 November 2018

During the early hours of Friday morning a narrow band of rain lying through the Irish Sea, fringed southwest England, western parts of Wales and extended across northwest England and across the heart of Scotland. This rain gradually eased and fragmented towards morning. Elsewhere, there were clear periods, but also isolated showers across southern England. It was breezy, and this helped hold temperatures up.

The main focus of the weather during Friday afternoon has been the wet and windy weather arriving from the west into Northern Ireland, Wales and southwest England, which has been accompanied by some strong to gale force southerly winds, with gusts up to 50-60 mph in the far southwest of England by late-afternoon and into the evening. Ahead of this, it has been a mostly dry, bright and mild day, especially for East Anglia and southeast England.

### Summary of the UK Weather for Saturday 10 November 2018

Saturday was generally a mild day and began with low pressure centred to the northwest of the UK. A cold front lay south to north across the eastern half of the country and a southwesterly flow of returning polar maritime air followed on behind. The cloud and rain associated with the front cleared into the North Sea during the small hours of the morning. The frontal band of cloud and rain was accompanied by strong southerly winds giving gales over exposed hills and coasts. In the southwest organised bands of heavy and occasionally thundery showers moved northeastwards also accompanied by a strong to fresh southwesterly wind. Saturday daytime saw bands of organised showers move across Wales and England and Scotland, interspersed by spells of drier, brighter, and sunnier weather. The wind eased through the day, although they remained stronger and gusty along windward coasts. On Saturday night the organised bands of showers gradually clear northeastwards with scattered showers generally becoming confined near to coastal areas. There were some clear skies inland where it was mainly a dry night for many.

### Summary of the UK Weather for Sunday 11 November 2018

Most places had some lengthy clear spells through the early hours, and these were most prolonged towards the north and east of the UK. Some showers pushed in, which were most frequent around the north and west, with an area of more organised showers spreading across southwest England by dawn. Some of the showers were heavy with the odd rumble of thunder. A band of showery rain spread northwards across Northern Ireland, Wales, the Midlands and East Anglia northwards into Scotland during the daytime, but it weakened slowly, with another organised band of showers feeding across Ireland and Northern Ireland towards the Irish Sea. Elsewhere there were sunny spells and more scattered showers, and some were heavy with thunder. The best of the sunshine developed across central and eastern England as the day unfolded. It was windy; especially in the west and southwest, with gusty conditions during some of the showers. Temperatures were around average for the time of year.

### Summary of the UK Weather for Monday 12 November 2018

There were clear skies across a central swathe of the UK from SW England, through the Midlands, and into eastern England. However, there was also a band of showers bringing rain to parts of Wales, NW England and parts of Scotland. Further showers affected the southeast of England through the early hours of the day. During the daytime, there was sunshine across the UK, interrupted by frequent showers almost everywhere, but particularly in the west. Some showers were heavy and thundery with hail. Temperatures were mild for the time of year.

### Summary of the UK Weather for Tuesday 13 November 2018

There were heavy showers across Kent, southwest England, Wales, northern England, Northern Ireland and Scotland through the early hours of the day. Elsewhere, it was a clear start. Temperatures were mild, and most places stayed frost-free, although parts of Scotland did dip close to freezing.

The showers gradually retreated further west during the morning and by afternoon, it was dry almost everywhere. The eastern part of the UK had widespread sunshine. Afternoon temperatures were above average for the time of year, despite a keen breeze across the country. By the end of the day, cloud thickened for many areas, as rain spread in across parts of Northern Ireland.

Through the evening and start of the night, rain moved in across Northern Ireland, western Scotland, northwestern England, and west Wales. Elsewhere, it was dry with variable amounts of cloud and it remained breezy.

This day's summary created 12/12/2018 18:22

### Summary of the UK Weather for Wednesday 14 November 2018

Through the night, rain continued to affect many northern and western parts of the UK. The rain was heaviest across southwestern parts of Scotland. Further south and east, it was largely dry with variable amounts of cloud and some clear spells. Winds also strengthened in the north and west, with the strongest gusts across the Irish Sea, and it was a generally mild night for all.

Rain continued to push northeastwards across Scotland, northwest England and parts of north Wales through the day, although the heaviest of the rain remained across western Scotland. It was windy here too with gales around exposed western parts and through the Irish Sea. Elsewhere, skies brightened up with plenty of sunshine across southern and southeastern England. Temperatures remained very mild for the time of year, with the highest of the temperatures across eastern Scotland.

Damp weather continued to affect parts of Scotland and Northern Ireland through the evening and start of the night. Elsewhere, it was dry with variable amounts of cloud.

This day's summary created 12/12/2018 18:22

### Summary of the UK Weather for Thursday 15 November 2018

Patchy rain continued to affect parts of Northern Ireland and western Scotland overnight. It was dry elsewhere but with largely cloudy skies across much of England and Wales. Much of this cloud was fairly low with hill fog in places. Where skies did clear, mainly across central and northern parts of England, patches of fog developed in-situ. Under the cloud cover, it was generally mild, but it turned rather cold where skies cleared, with a grass frost in places. Through the day outbreaks of rain continued to affect northwest Scotland and later Northern Ireland, before becoming heavier and more persistent through the latter part of the afternoon and early evening. Elsewhere it was dry, with the best of the sunshine across northeast Scotland, Wales and some northern and central parts of England. Further south, the cloud was more extensive with some patchy light drizzle across parts of central and southwest England. A few brighter spells developed in places and it was mild.

### Summary of the UK Weather for Friday 16 November 2018

Low cloud became widespread across England and Wales during the early hours, bringing mist and fog to many places, along with some patchy drizzle. Elsewhere there were some clear spells, and where winds fell light some pockets of frost and fog developed. It was another remarkably mild night under the blanket of low cloud.

Skies stayed grey and cloudy for many places through the day, with mist and hill fog in many eastern and southern parts. It stayed largely dry for most places too, although there was the odd spot of drizzle where the cloud thickened. Sunny spells formed in some northern and western areas and it became rather mild here.

### Summary of the UK Weather for Saturday 17 November 2018

The early hours of Saturday saw a lot of low cloud across many parts of the UK, although parts of northwest Wales, Cumbria and northwest Scotland had largely clear skies. Towards dawn, clearer skies also started to move into parts of the southeast and East Anglia, although this then allowed a few fog patches to form here. The mist, fog and low cloud took its time clearing eastwards through the rest of the morning, but most places had clear sunny skies by the early afternoon, which continued until sundown. Only Northern Ireland and eastern Scotland were stuck with mist and low cloud lingering continuously through the day. During the evening, the skies remained clear. Temperatures were around average for the time of year, except in western Scotland, where they were above average.

### Summary of the UK Weather for Sunday 18 November 2018

Most areas were dry overnight with long clear periods. However, eastern Scotland and parts of northeast England were cloudier. Some fog patches also developed across northeast England and northwest Scotland. It was breezy and most areas were fairly chilly with some frost forming away from windward coasts. Through daylight hours, the fog and mist cleared up, with clear blue sunny skies across most of the UK. However, cloud lingered in eastern parts of Scotland and the northern Isles. It was quite breezy, as easterly winds brought a chill to the air. The highest wind gusts were found in the west, and along the south coast of England.

### Summary of the UK Weather for Monday 19 November 2018

Skies began clear at the start of the night, but cloud gradually spread across the country from the east. The cloud brought a few light showers to eastern counties in the small hours, but elsewhere it stayed dry. Most places stayed above freezing due to the cloud and a brisk easterly wind. Cloud continued to spread across many areas during Monday morning, although there were some bright or sunny spells in places. The best of the sunshine remained across northwest Scotland and parts of west Wales, however further south and east showers continued to feed in on a brisk easterly winds. Showers turned heavier through the afternoon and evening across southeast England and a few showers drifted into central areas too. It felt cold for most, especially given the strong winds. Clear spells in the west through the evening meant it turned chilly, but elsewhere there was a good deal of cloud with scattered showers.

### Summary of the UK Weather for Tuesday 20 November 2018

There were some clear spells overnight but also a good deal of cloud with some showers, these mainly in the east and southeast. A brisk wind, strongest around eastern and southern English coasts kept temperatures from dropping too low. However, there was a touch of frost in parts of the northwest and also some central and southern areas. Tuesday was a cold and blustery day with brisk winds from the east. There were plenty of showers around, some of them heavy. There was some sleet and snow, mainly over the high ground of Wales, but also the high ground of southwest England, north England and Scotland too. A little sleet was also seen to lower levels in parts of the southeast. Temperatures were widely below average and it felt cold in the wind. Frequent showers continued through the evening with some still heavy and locally wintry over the hills. A spell of more persistent rain and sleet pushed into parts of the south and southeast.

This day's summary created 12/12/2018 18:22

### Summary of the UK Weather for Wednesday 21 November 2018

There were frequent showers through the early hours; some were heavy and in a few places they brought brief flurries of sleet and snow to the hilltops. The heaviest and most frequent showers were over east and northeast England, east, central and southern Scotland, parts of Northern Ireland and coastal counties of southern England. There were clear spells in the far northwest, and also southern England where there were mist and fog patches, a localised frost, and some icy patches. It was windy for some, especially in the north and east, with gales around coastal areas. Through the day, blustery showers continued across northern and eastern parts of Scotland and England. Further south, an area of rain and hill snow affected central southern England as well as parts of Wales, although this turned back to rain later in the morning. Otherwise, there were plenty of sunny spells across the UK, with the southeast seeing the best of the dry weather. Temperatures were below average for the time of year.

### Summary of the UK Weather for Thursday 22 November 2018

Through the early hours of the morning, there were clear skies across most of the UK, where mist and fog patches formed, as well as a widespread frost and some icy patches. However, it was mainly overcast around the eastern coastline, with outbreaks of light drizzle to start the day. The fog and freezing fog slowly cleared through the morning, but skies stayed grey and cloudy across many eastern and central parts of the UK, with outbreaks of rain and drizzle across eastern and central Scotland. Further west, it was a dry and bright day. It was chilly in the easterly breeze, and temperatures were lower than average for the time of year.

This day's summary created 12/12/2018 17:43

### Summary of the UK Weather for Friday 23 November 2018

Through the early hours of the day, there were heavy showers across southwest England, and also some showers across northern England and Scotland. Elsewhere, there were overcast skies, hill fog, mist and drizzle, giving a rather grey start to the day. Further showers spread across parts of southwest England through the morning, some were heavy and thundery. The showers then continued northwards into Wales. Most of these showers eased away though through the first part of the afternoon, but then further thundery showers arrived across southern parts of England into the evening. Showers pushed across parts of Scotland too, mainly the Central Belt northwards, heaviest and most widespread in the east. Elsewhere, there was a good deal of dry weather, though it was generally fairly cloudy. Temperatures were a touch below average for many, but a little above in the southwest.

### Summary of the UK Weather for Saturday 24 November 2018

The far south and southwest of Wales, Southwest England, and later some other southern counties of England saw showery outbreaks of rain during the early hours, the rain heaviest in the southwest. Some showers affected Scotland and northern England, otherwise it was largely dry with limited clear spells, and some fog patches, these mainly over the hills. A frost formed in Scotland and northern England, but elsewhere it was largely frost-free.

It has been a cloudy day across southern counties of England, with further outbreaks of rain, especially along southern coastal regions. Elsewhere, there were variable amounts of cloud, with some bright or sunny spells, mainly in the west and northwest. There have been some showers feeding into southern Scotland and northeast England throughout the day. It has been a cool day, with an easterly breeze. Temperatures have generally been around the average for this time of the year.

### Summary of the UK Weather for Sunday 25 November 2018

Showery rain continued to affect southernmost counties of England at first, but towards dawn these became restricted to the far southeast corner of England. Elsewhere, showers also pushed across eastern counties of England and Scotland, with some heavy bursts in places as well as a little wintriness on the highest ground, whilst western areas remained dry with some clear spell. For most places temperatures held up just enough to keep much frost from forming, but in some sheltered parts of central and western Scotland as well as northern England it was cold enough for some patchy frost and fog. Through Sunday, much of the UK was cloudy with further showers feeding into eastern coastal counties, with further snow over high ground in Scotland. Some brighter breaks developed into the afternoon, most of these in the west. For late November temperatures were a little colder than average for all parts and this was accentuated on the east and south coast with a noticeable easterly breeze.

This day's summary created 12/12/2018 17:43

### Summary of the UK Weather for Monday 26 November 2018

Showers continued to feed into eastern parts of Scotland, England and Northern Ireland through the early hours of Monday morning, with a few of these showers on the heavy side. Elsewhere, there was a mixture of clear spells, patchy cloud and some areas of mist and fog. Western parts of the UK saw the skies stay clearest for longest allowing some pockets of frost to form too. During the day, showers peppered eastern coastal areas of Scotland, England and Northern Ireland although with only a light easterly breeze, they didn't make too much progress inland. The odd shower was heavy, especially around coastal parts of East Anglia and southeast England. Elsewhere, it was dry with spells of sunshine and light winds, but despite this it still felt chilly for all parts with temperatures close to or just below average overall. During the evening, under clear skies temperatures quickly dropped away in western and some central parts of the country with an early frost. It also turned murky with mist, fog and low cloud forming fairly readily through the evening.

### Summary of the UK Weather for Tuesday 27 November 2018

With clear skies around at first, it quickly turned cold and frosty in some rural western parts. However, most of the clear skies were filled in with low cloud, mist and fog, which became particularly dense across central, southern England, where there were also some patches of freezing fog. A few showers continued in the extreme east, but more rain started reaching parts of southwest England towards dawn. Fog was slow to clear across central and eastern England during the morning. A band of steady rain then crossed the UK from west to east during the day. The rain was heavy at times with strong, blustery winds. However, it became fairly mild. The rain started to clear in the west during the evening, with a few mist and fog patches here, and the winds eased too.

### Summary of the UK Weather for Wednesday 28 November 2018

Rain moved into the southwest of the UK in the early hours of Wednesday morning. It became rather murky in many places, with low cloud, hill fog and widespread mist. Winds began to increase, particularly in the west. It was much milder than the night before with all parts staying frost free. A spell of wet and windy weather swept north and eastwards across the UK during the day. The strongest winds were across Wales and southwest England, with gales around the coasts, and severe gales over some exposed parts of Wales, especially over higher ground. There were some improvement in the far southwest of England later in the day, with occasional brighter spells, but also some showers. It was been an exceptionally mild day for the end of November.

### Summary of the UK Weather for Thursday 29 November 2018

After a brief interlude of drier weather, outbreaks of rain spread northeast during the early hours of the morning, with some heavy rain developing across parts of Wales and southwest England. The wind strengthened steadily too, with gales becoming widespread in the south and west by morning, and with some severe gales developing along southwestern coasts. It was a mild night for all.

Through the daytime, the winds stayed strong. Winds in excess of 50mph were reported widely in the southwest through the morning along with heavy rain, then in the northeast during the afternoon, as the weather system moved towards the North Sea. Once the weather system passed through, skies became brighter, with some heavy showers, which brought hail and thunder in places.

### Summary of the UK Weather for Friday 30 November 2018

Overnight many eastern areas stayed dry with clear skies. However in the north and west scattered blustery showers spread in, merging into longer spells of rain across Scotland at time. It was a mild night for many with temperatures remaining above freezing across all parts of the UK.

It was a day of sunshine and showers for most through the day. The showers were heaviest and most frequent across Scotland, Northern Ireland and northern England. Many southern and eastern areas got away with a generally dry day with more in the way of sunshine compared to previous days. It was breezy in any showers, with the strongest of the winds across Scotland. It was a cooler day for many, particularly across southern areas that have been mild of late.

Many of the showers faded away through the evening and start of the night, although they continued across western Scotland. Outbreaks of patchy rain reached southwestern areas towards midnight.

### Daily Extremes

<i>Highest Maximum</i>	<b>13.1°C</b> Bognor Regis (West Sussex, 7mAMSL)

## Daily Weather Summary for Friday 30 November 2018

## Daily Weather Summary for Friday 30 November 2018

None of the selected stations observed a day of sleet or snow falling or non-zero snow depth at 0900 UTC.

## Guidance Notes

UTC = Universal Coordinated Time. For the UK UTC is the same as GMT (Greenwich Mean Time).

National boundaries shown on the European station map are for illustrative purposes only.

### Daily extremes

- Daily extremes have been manually confirmed by Met Office Observations Quality Management as valid observations from the live database at the time of checking. However, more extreme values may still be possible if they occur after the time of production.
- Mountain stations above 500 masl are excluded from lowest temperatures, highest gust speeds and greatest snow depths at 0900 UTC. This is because they are not considered representative of low level areas.
- Counties quoted against each station are based on historical county boundaries pre-1974 and may not reflect current administrative boundaries.

### Analysis charts and satellite imagery

- The satellite imagery is infra-red imagery from the geostationary MSG satellite.
- The rainfall image is derived from satellite data from MSG and rain-radar data. This represents a snapshot of instantaneous rain-rates at 0000 UTC and 1200 UTC and so does not necessarily reflect daily accumulations in the rainfall station map.
- Any analysis charts or satellite images which are unavailable will be displayed as white space.

### Station maps

- The UK maps show station data for the same set of stations presented UK data table. These stations are selected to provide good spatial coverage across the UK; they represent only a fraction of the overall UK observing network.
- Wind speed maps show wind speed in Kt and direction both averaged over the hour up to the time of observation. 1 Kt = 1.151 mph.

### Hourly station data

- The data tables provide spot hourly observations from synoptic messages at 0000 and 1200 UTC. Missing data are denoted by '-'.

- Pressures are mean sea level pressure in hPa.
- For UK stations, Gibraltar and Jersey, the wind speeds and directions are both averaged over the hour up to the time of observation. However, for European stations wind speeds and directions are both averaged over a 10-minute period up to the time of observation.
- Wind speeds are in Kt. Wind directions are stored in the database every 10 degrees and have been converted to the nearest point of the compass. These give the direction the wind is blowing from, not to.
- Cloud amounts are in Oktas from 0 (clear) to 8 (overcast). 9 indicates sky obscured (eg by fog).
- Air temperature and dew point temperature are in Celsius.

### **Temperature maps**

- Daily maximum, minimum and grass minimum temperatures are in Celsius.
- The period for the daily maximum temperature on day D is defined from 0900 UTC day D to 0900 UTC day D+1.
- The period for the daily minimum and grass minimum temperatures on day D is defined as 0900 UTC day D-1 to 0900 UTC day D.
- On any given day D the minimum will typically occur in the early hours of the morning and the maximum in early afternoon.

### **Rainfall, sunshine and max gust speed maps**

- Daily rainfall is in mm from 0900 UTC day D to 0900 UTC day D+1.
- Daily sunshine is in hours from Kipp and Zonen CSD1 automatic sunshine records. Bright sunshine is defined as exceeding 120 W/m<sup>2</sup>.
- Max gust speeds are the daily max gust in Kt from 0000-0000 UTC

### **Snow maps**

- The day of snow falling map displays data from present weather sensors, showing stations which have recorded sleet or snow falling at any point in the day (0000-0000 UTC).
- The snow lying map shows level snow depth as recorded by the automatic snow depth sensors at 0900 UTC. These snow depth sensors do not record snow depth if this is less than 1cm.
- Snow depth sensors are normally operational from October to April, in the event of snow falling outside this period data availability may be limited.
- Snow maps will only be displayed if one or more of the selected stations on that date have recorded either snow falling or non-zero snow depths. If snow maps are not

displayed it is still possible that other stations in the network have recorded a day of sleet or snow falling or non-zero snow depth.
