Daily Weather Summaries for November 2021

If you have any questions or feedback about this product or wish to obtain further data please contact the Met Office.

This document contains daily weather summaries for each day of November 2021. The Met Office National Meteorological Library and Archive holds a continuous record of daily weather summaries or daily weather reports from 1860, and these daily weather summaries form a continuation of that series.

The purpose of each summary is to provide an overview of the weather conditions across the UK on that day, with the historical emphasis mainly based on observations from surface network of weather stations, although the format has varied over the decades. While the emphasis remains on observations from the surface network, the current daily weather summaries supplement these by including satellite and rain-radar imagery to provide a more complete overview. The current format of the daily weather summaries is as follows:

1. Text summary of the main characteristics of the weather during the day, written by an operational meteorologist in the Met Office operations centre.
2. Table of daily extremes for the UK for key climate variables including temperature, rainfall, sunshine and gust speeds.
3. Overview of the synoptic situation at 00 and 12 UTC comprising: analysis charts showing the surface pressure pattern and associated weather fronts; North Atlantic and European infra-red satellite images showing cloud-cover; combined infra-red and rain-radar images of the UK; maps of wind speed and direction at 00 and 12 UTC; observations of pressure, wind speed and direction, cloud cover, air and dewpoint temperature at selected UK and European stations in data tables.
4. UK maps of key climate variables from observing stations including maximum, minimum and grass minimum temperature, rainfall, sunshine, gust speed and snow.
5. Further guidance notes

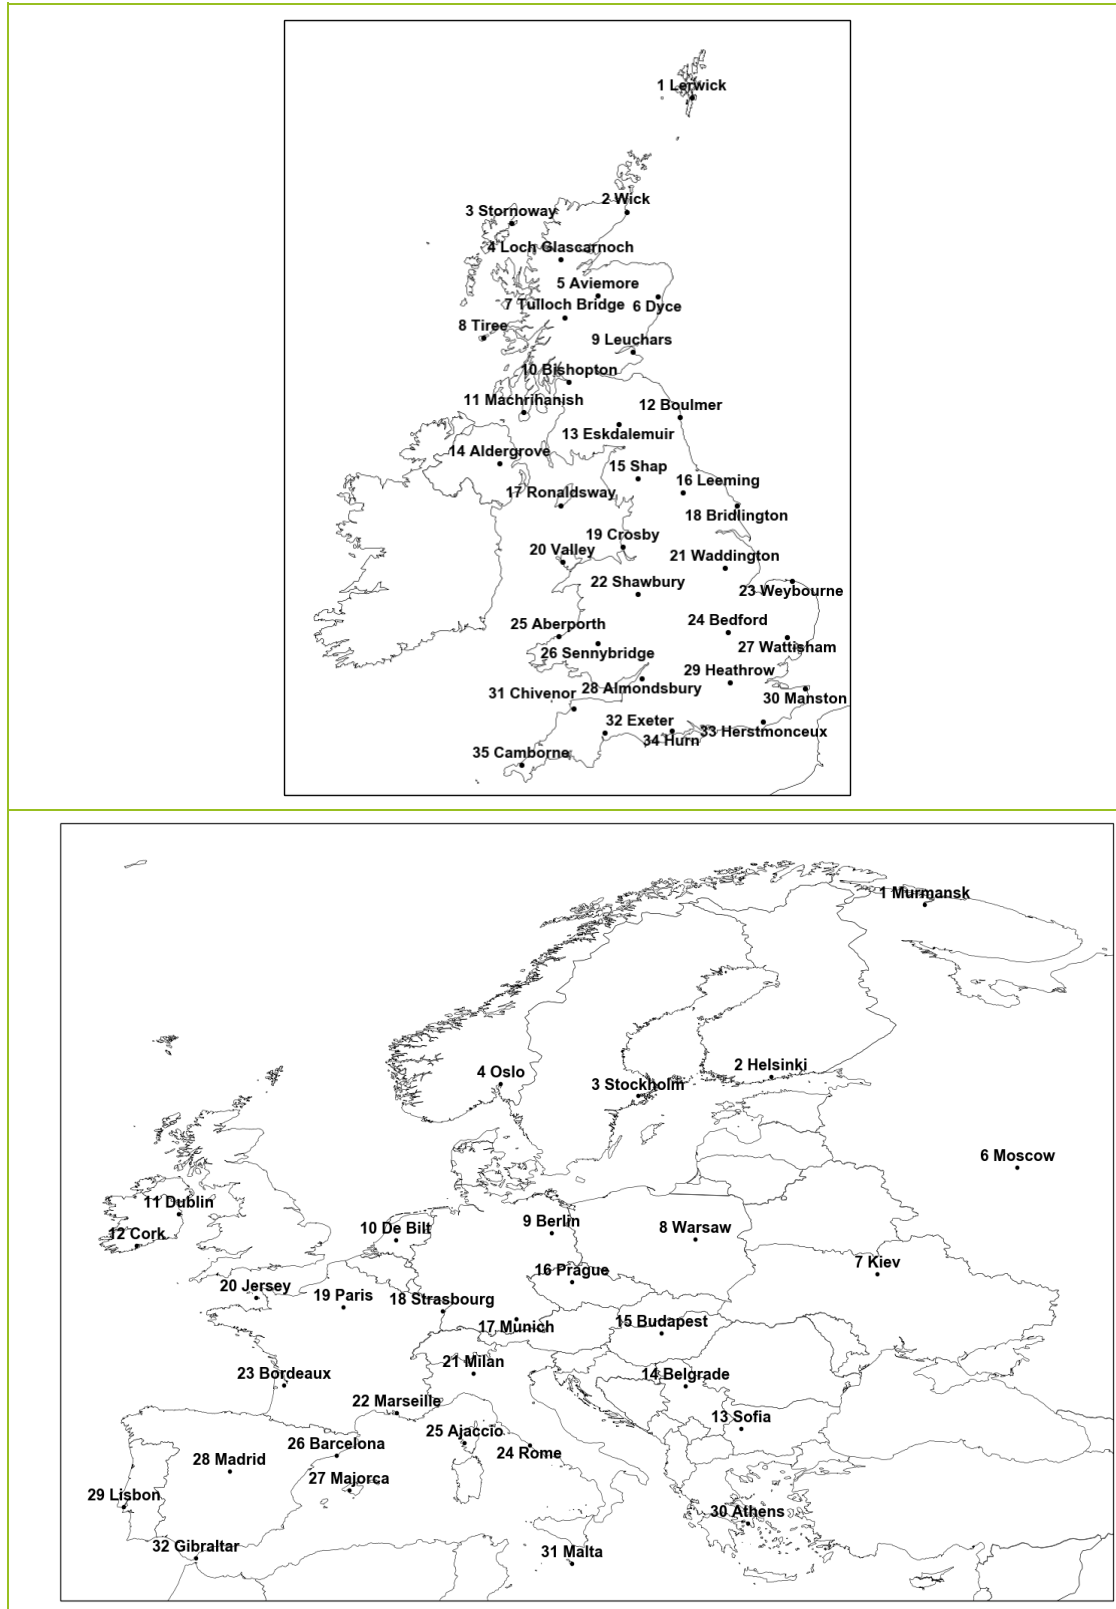

If you spot any data errors or omissions in this product please contact the Met Office.

Daily Weather Summary for Monday 01 November 2021

This day's summary created 08/11/2021 03:03

Summary of the UK Weather for Monday 01 November 2021

Low pressure continued to dominate the synoptic situation over the UK into the start of the new week. Lighter rains were seen across Wales, the Midlands and the southwest through the early hours, whilst some more persistent rain fell across the north of England, Northern Ireland and Scotland. Winds remained strong and gusty in the northwest. The southern half of the UK and Wales then gradually cleared through the night leaving some clear spells by dawn. A band of rain moved over northern Wales and the northwest England through the morning, slowly clearing eastwards towards the East Midlands during the afternoon. Showers affected Wales, the southwest, Northern Ireland and northern Scotland during the morning and throughout the afternoon and clearing for most places by evening. The southeast saw sunny spells whereas it remained largely cloudy elsewhere. The strong winds and gusts in the northwest and the Irish sea eased through the day and evening. Some showers continued to affect the northwest, the southwest and the northwest of England through the evening.

Summary of the UK Weather for Tuesday 02 November 2021

A relatively benign start to Tuesday in comparison to recent days. Overall a chilly night with some localised fog and frost patches, particularly in the south. Isolated showers were seen throughout the night, mostly focused across parts of the southwest, midlands and west Scotland. Plenty of clear skies developed elsewhere across the UK with the most of any cloud concentrated in west Scotland. Winds were mostly light or calm as the low-pressure system which has influenced recent weather, has moved northward. Coastal showers in east, north Scotland and along the west coast persisted through the day, with clear skies in large areas of south and southeast England, the West Midlands and Wales. Through the day cloud moved eastwards across Wales and England, bringing widespread showers to large parts of the country, before dying out through the evening. Coastal showers persisted through the evening and early part of the night, with long clear spells, particularly in central and southern England and Wales.

Summary of the UK Weather for Wednesday 03 November 2021

Tuesday started off rather cloudy for most of the country. Showers which were locally heavy were mainly confined to coastal areas including the northeast and southwest of England, Wales, Northern Ireland and northern Scotland. Elsewhere which mainly consisted of inland areas remained largely dry with clear spells in places. These clear spells resulted in low temperatures across central and southern England which resulted in some grass frost. Fog was reported along the east coast and the south of England. A northerly flow brought showers, some of which were locally heavy, through the day, mostly in coastal areas through the morning, particularly northern and eastern Scotland, northeast England, Wales and Cornwall. These showers progressed further inland along the east coast, particularly around Lincolnshire, and then further into northeast England and East Anglia through the afternoon. Convergence lines formed along the Welsh coast in the Irish Sea, and along the English Channel near Calais, which persisted through the day. The showers died back to the coast through the evening.

Summary of the UK Weather for Thursday 04 November 2021

Thursday started with a northerly airflow due to low pressure situated to the east of the UK. It was breezy for most, but the strongest winds were along eastern coasts. Showers mainly affected coastal areas including west Wales, northern Scotland, Northern Ireland, Cornwall and the east coast of England. These showers were locally heavy in places and convergence strengthened activity in the 'Pembrokeshire Dangler' and East Anglia. Some showers moved inland across parts of East Anglia and the East Midlands towards dawn. It remained largely cloudy for most, with some frost in southwest Scotland. The band of showers spread inland in the southeast during the early morning, some of these heavier, particularly over Norwich and Cambridge. These dissipated after a few hours to leave few, scattered showers inland while the coastal showers continued throughout the day. Clear skies remained over the southwest until early evening when cloud began to build. Aurora may be visible across Northern England, Scotland and Northern Ireland, and perhaps parts of the Midlands, Norfolk and North Wales with the naked eye where skies are clear.

This day's summary created 12/11/2021 03:03

Summary of the UK Weather for Friday 05 November 2021

Large parts of England and Wales saw clear skies through the early morning, while Scotland and Northern Ireland saw more cloud, some fog also formed in Scotland, mostly over higher ground. It was a dry night for most, although scattered showers along the west coast of Scotland continued through the night, and a band of rain moved south from East Scotland and dissipated. Showers also continued along the Welsh coast and moved south into Devon and Cornwall. Cloud started to push further into the clear areas through the night. There were strong winds in some coastal areas, particularly the east coast through the night. Showers persisted over Stoke-on-Trent, Northern Ireland and coastal Scotland throughout the day, while scattered showers formed intermittently over the southwest, coastal Wales and later the southeast. Cloud covered the whole of the UK throughout the day, except the southeast which remained clear until late afternoon. A cooler morning, and average temperatures throughout the day. Heavier showers moved in to western Scotland and North Wales through the evening covering most of Scotland by midnight, with winds strengthening.

This day's summary created 13/11/2021 03:03

Summary of the UK Weather for Saturday 06 November 2021

Persistent rain, heavy at times, lasted through the night for Scottish coasts, particularly the north and the Borders. Showers also lasted for northern England, becoming more prolonged in the northeast at times, and moving south into the East Midlands. Scattered showers also affected Wales and the Southwest. The far southeast was clear to start, but soon clouded over, and the UK remained generally cloudy, though it was patchy at times. Winds strengthened through the night, particularly along the west coast, with potential gales for western Scotland. Temperatures milder than previous nights. Persistent rain continued through the day for many across the UK, heavy bands of rain pushed southeastward across the country through the day, affecting Northern Ireland, Wales, Scotland and north and central England by midday. Leaving some drier conditions in southeastern and southwestern areas until early evening. Winds remained blustery through most of the day particularly in western coastal locations, with Scotland experiencing the strongest winds. Behind the persistent rain, showery rain pushed across the country. Temperatures remained near average.

Summary of the UK Weather for Sunday 07 November 2021

Showers persisted over the north of England, Northern Ireland and, far heavier, over Scotland through the early morning. The southwest remained clear of cloud compared to the rest of the UK, and some light showers appeared over Wales by dawn. It was a predominately dry day for most expect for parts of western Scotland who experienced showery conditions, some locally heavy. Some isolated showers were also experienced through Northern Ireland and the north of England, however these cleared by midmorning. The rest of the day was cloudy for many with some sunny spells particularly to the south and southwest. It remained rather blustery for many further north, particularly at coastal locations. Temperatures remained near average for the time of year.

This day's summary created 15/11/2021 03:03

Summary of the UK Weather for Monday 08 November 2021

Showers dominated Northern Ireland through the night, and western Scotland also experienced some scattered showers and patchy rain spells. Elsewhere remained dry in the early hours, with cloud building progressively into the morning, covering Scotland initially, and then spreading southeast over the UK by dawn. Patches of rain spread to Wales and the northwest of England, while fog and mist were present in the southwest coast and rural locations. Scotland experienced wet conditions and strong winds as a band of rain moved west over northern parts through the late morning and into the afternoon, heaviest in western parts. Another band followed into the later afternoon, covering parts of Northern Ireland and western parts of Scotland. Elsewhere, showers were experienced along western coasts of northern England. Thick cloud covered most of the UK, especially in northern parts accompanying the rain, leaving few clear spells in some central and eastern parts.

Daily Weather Summary for Tuesday 09 November 2021

This day's summary created 16/11/2021 03:03

Summary of the UK Weather for Tuesday 09 November 2021

A weather front dominated the weather through the early hours of the day, bringing persistent and locally heavy rain to Northern Ireland, southern Scotland, and parts of northern England. Northern Scotland saw clearer weather with some blustery showers. The rest of the country experienced dry conditions with some clear spells leading to some mist and fog patches through Wales, central and southern England. Conditions remained mild. Several fronts passed from west to east, bringing rain, sometimes heavy to areas of north and western Scotland, Northern Ireland and northeast England. This was more persistent over central parts of the UK covering Manchester, Cheshire and Lancashire. Elsewhere, it remained dry with sunny spells for the south and southeast of the UK with occasional patchy cloud.

Summary of the UK Weather for Wednesday 10 November 2021

A stationary cold front sat across the UK through the early hours stretching from the north west coasts of England to the Scottish border bringing persistent and locally heavy rain to the northwest of England, Yorkshire, the Midlands, and Wales. Elsewhere, the south was left dry and clear which led to the development of fog. The cold fronts slowly pushed southeastwards through the morning, bringing cloudy conditions and the weakened rainfall to the Midlands in the morning. The north brightened as fronts passes. Into the afternoon, low cloud enveloped much of central and southern England and Wales, as the fronts pushed southeastwards. Some drizzle was seen in part of south Wales and southern England. Further north, skies were brighter but showers were heavier in northwest Scotland. Into the evening, as a band of heavy showers moved east across far north Scotland, Northern Ireland, southern Scotland and parts of northern England experienced clearer spells. Southern UK remained cloudy and a patch of drizzle slowly moved from south Wales to southern Midlands and eastern England.

Summary of the UK Weather for Thursday 11 November 2021

Several fronts moved slowly over the British Isles throughout the night. A series of occluded fronts brought rain and drizzle to Scotland, with the heaviest being in northern parts, accompanied by strong winds. A band of rain also moved slowly over southern Wales eastwards to central and eastern parts. Light drizzle was also experienced in the south east. Extensive low cloud and fog across central and southern areas began movement northwards. Into the morning, while the frontal cloud continued to push into the northwest from the Atlantic, the south and southeast remained cloudy with some mist and fog patches. Wales experienced some drizzly rain in the early morning and Northern Ireland saw some rain later into the day. Into the afternoon, while there were occasional cloud breaks to give brief brighter spells in the south, the fronts pushed more clouds and rain further into the northwest as winds also started to strengthen. Through the night, the winds and rain in northwestern UK remained as the low pressure system moved closer. Some dry spells were seen in Southern and southeastern England.

This day's summary created 19/11/2021 03:03

Summary of the UK Weather for Friday 12 November 2021

An area of low-pressure moved eastwards across Scotland through Friday bringing wet and windy conditions to northern and western parts of the UK. Through the early morning a cold front passed across much of the UK followed by a second front bringing rain into the northwest of the UK, both features brought spells of heavy rain and gales to northwestern parts, as well as low cloud and hill-fog to the upland areas in the west. Through the daytime, outbreaks of rain and drizzle affected Northern Ireland, England, and Wales, with some heavier rain moving eastwards across Scotland. It was quite a breezy day for many, but the winds were lighter under the centre of the low pressure across southern Scotland. It was rather cloudy for many, with the best of the sunshine in the southeast through the middle of the day. It was a mild day, by and large, with the winds then easing through the evening as high pressure moved in from the west bringing more settled conditions.

This day's summary created 20/11/2021 03:03

Summary of the UK Weather for Saturday 13 November 2021

Through the early hours, the decaying occluded fronts brought one last spell of rain to parts of eastern Scotland, Wales, central and eastern England, before giving a drier period to the UK. It was largely cloudy through the night, only central and southern Scotland saw some breaks in the beginning. As the low pressure moved further away, the cloud breaks expanded meridionally. North Scotland, Northern Ireland and parts of northwest England began to see clearer skies before dawn. During the daytime, with the decaying fronts slowly clearing southeast, there was a good deal of sunshine in central and southern Scotland, the west of Northern England, and the north Midlands, while the east of the UK remained cloudy with very limited sunny breaks. A warm front slowly crossed through Northern Ireland through the day and arrived into western Scotland during the evening, with milder air behind it. The front brought some light rain and drizzle in places.

This day's summary created 21/11/2021 03:03

Summary of the UK Weather for Sunday 14 November 2021

To start the day, a warm front continued to linger over the west coast of Great Britain, with a decaying occluded front over the east coast. These fronts brought patches of rain and drizzle to western and central Scotland, Northern Ireland, western Wales and the east of England. Besides the rain, many in the UK experienced a cloudy night, except for parts of northwest England, the West Midlands and Southwest England, where clear skies were seen. Fog patches were also recorded in Shawbury and Rostherne No2. The patches of drizzle cleared up through the morning, leading to a dry afternoon for most. Parts of western Scotland saw some rain during the afternoon as a cold front swept northeastwards from the west, bringing a swathe of thick cloud to Northern Ireland also. The cold front continued to move across Scotland and Northern Ireland into the evening, leading to rainfall across much of these countries, in addition to some rain in the far west of Wales. Elsewhere remained dry throughout the day.

Summary of the UK Weather for Monday 15 November 2021

High pressure dominated to start the week. Despite this, a cold front brought some moderate to heavy rain across western Scotland. As this moved southeast, the rain quickly became lighter and patchier, with the front arriving into the northwest of Wales and England by dawn. Behind the front, clearer conditions arrived into the far northwest with a few showers. Ahead of the front, it was cloudy. However, under a clear slot stretching from Scarborough, through the Midlands to southwest England, it turned quite cold, with some dense fog patches forming. The cold front continued to slowly travel southeastwards during the late morning, with rain showers dissipating through the afternoon. This left a band of thick cloud stretching across from southwest England to Yorkshire, with an area of clearer skies ahead of the front. This area under clear skies felt much chillier than areas close by that were insulated by the cloud cover. As the day concluded, patchy rain crept into the far northwest and most of the UK remained cloudy.

Daily Weather Summary for Tuesday 16 November 2021

This day's summary created 23/11/2021 03:03

Summary of the UK Weather for Tuesday 16 November 2021

A clear slot, which extended from The Wash southwest to the Isle of Wight, was associated with some locally dense fog patches as well as much colder temperatures. Either side of this clear slot, it was cloudy and milder, with some light rain and drizzle for many places. A decaying occluded front was stuck across England and Wales, but through the early hours a more active cold front was approaching the northwest, with some areas of light to moderate rainfall running ahead of it across Northern Ireland and Scotland. Rainfall, some heavy, continued on western coasts, particularly in Scotland through the morning. The rest of the UK remained mostly dry, with clearer spells seen in the east. Showers developed as a rain band progressed eastward across central parts through the afternoon. Cloud continued to develop and by late afternoon across the north of England and the south east saw some heavier showers. This rain band continued to cross southern England before becoming clearer into the evening. Scotland saw blustery showers into the night, with some becoming wintry on the hills.

Summary of the UK Weather for Wednesday 17 November 2021

The day began with a cold front lying from southwest Wales across to Hull, traveling southeastwards. The presence of a trough over northwestern Scotland brought some locally heavy scattered showers to the area, with some showers extending down into the northwest of England and areas of Northern Ireland. During the small hours of the morning, the movement of this front led to some showers creeping further southeastwards, dissipating as time went on. Elsewhere remained dry with widespread cloud across the UK. Northern showers continued into the start of the afternoon whilst Wales and the south remained dry with some prolonged sunny spells, particularly in the south west and south east. North Wales remained cloudy. By late afternoon cloud cover increased across most of the UK with showers continuing across the far northwest and west Scotland. Heavier rain developed in west Scotland into the night with clear spells elsewhere. Windier conditions were found in the north.

Summary of the UK Weather for Thursday 18 November 2021

With a low pressure centre lying to the northwest of the UK, winds were brisk for most, with frontal systems dominating the synoptic situation to start the day. Through the small hours, heavy rain poured across northern and western Scotland, with some lighter rain creeping into parts of northwest England. Elsewhere remained dry with widespread cloud cover providing insulation, allowing for some mild nighttime temperatures, particularly in the southwest of the UK where minimum temperatures were in the double figures. It has been a benign day for much of the United Kingdom, with overcast conditions for much of Wales, England, and Northern Ireland, with the odd sunny spell. The southern half of Scotland was also largely overcast, but the north saw persistent, heavy rain throughout day, starting off in the western Isles and moving over to Shetland and Orkney as midnight approached.

Summary of the UK Weather for Friday 19 November 2021

A somewhat benign start to Friday with high pressure dominating across most of the UK. Therefore, there was a generally dry but cloudy start to the day through the small hours of the morning. West Scotland did however saw some more prolonged rainfall along with some very isolated showers also occurring along the Welsh coast. Winds were relatively calm across England and Wales but stronger across Scotland due to closer proximity to a low-pressure system to the north. Overall a milder night than previous days. The weather continued to be dominated by a high pressure system to the south throughout the day. Most of the country saw overcast conditions for the whole day, but there were a few sunny spells to be found particularly in the morning. The western isles and far north of Scotland has experienced some persistent heavy rain, brought about by a warm front lingering over the region. These conditions continued into the night with the rain traveling further south into Scotland.

Summary of the UK Weather for Saturday 20 November 2021

Another somewhat benign start to the weekend as high pressure continued to dominate the synoptic situation. England and Wales remained mostly dry through the early hours with varied cloud cover. Scotland saw more persistent heavier rainfall, particularly across the far north due to proximity to a frontal zone. Lighter rain also fell in the south of Scotland which at times extended into Northern Ireland forming isolated showers. Winds were light across England and temperatures remained mild for the time of year. A cold front dominated the weather in the UK right through the day, creating a somewhat north south split through the day, with cloudy milder conditions ahead of the cold front and clear colder conditions with occasional showers behind. By mid-afternoon the cold front stretched across parts of northern England bringing some more prolonged rain to parts of the northwest leaving Northern Ireland and Scotland with bright showery conditions. Into the evening the rain reached the Midlands leaving the south east and the south west under cloud cover and the colder, clearer conditions to the north.

This day's summary created 28/11/2021 03:03

Summary of the UK Weather for Sunday 21 November 2021

The weather overnight was dominated by a high pressure system to the west of the country, resulting a northerly flow and bringing persistent rain to the far north of Scotland and Northern Ireland. A cold front slowly made its way over the south of the country, bringing with it a band of drizzle mainly affecting Wales and the southwest of England. Light winds allowed temperatures to fall more than recent days and made way for a chilly morning for most. High pressure continued to dominate the weather across the UK right through the day with showers developing from early morning right along eastern coasts and along the Welsh coast, pushing inland along south eastern areas into Kent and Northern Ireland. Showers moved further inland through the mid-afternoon in northern locations, locally heavy at times. Elsewhere sunny spells dominated the day with good breaks in the cloud layer. Into the evening a warm front brought a band of thick cloud to parts of Scotland.

This day's summary created 29/11/2021 03:03

Summary of the UK Weather for Monday 22 November 2021

It was a rather benign night, with most of the country experiencing settled conditions due to a high pressure lying to the west. There was also a convergence line just off the south coast of England, which caused some persistent rain in Kent. Winds were light, which allowed for some fog to form in upland areas but otherwise it was a largely clear night which, combined with the northerly wind, caused temperatures to fall relatively low. The convergence line remained in place in the English Channel throughout the day which resulted in a persistent band of showers affecting the Channel Islands, Kent and Sussex into the evening. Showers affected northern Scotland during the morning and slowly cleared during the afternoon. Cloud, which was present across northern Scotland in the morning, progressed south during the day reaching northern England and Northern Ireland by dusk. Elsewhere experienced plenty of sunshine but generally rather cold especially with the breeze across the south of England. Patchy light rain and drizzle affected the northwest during the evening.

Summary of the UK Weather for Tuesday 23 November 2021

With a high pressure system lying to the west of the UK, many experienced rather calm and settled conditions. The far northwest of Scotland and southeastern coasts experienced some light showers, which cleared up through the night. Winds remained light, allowing fog patches to develop to form in some inland areas, densest in Northern Ireland. A band of cloud pushed southward from the North of England to southern coasts, away from the band of cloud it was a largely clear night which, combined with the northerly wind, caused low temperatures. Early morning fog across the south and East Anglia cleared through the morning. It was a largely dry day for many with any light showers and drizzle confined to the northwest of Scotland and northwest England during the afternoon. There were variable amounts of cloud throughout the day with thickest cloud mainly in the north while breaks in the cloud across southern, central and eastern England leading to sunny spells. It was cooler in the south and milder in the north, with strong winds in the far north of Scotland.

Summary of the UK Weather for Wednesday 24 November 2021

Through the early hours a cold front pushed southeastwards from the northwest into Scotland and Northern Ireland. This brought a large band of thick cloud and a band of rather persistent, locally heavy rain. It was breezy in some coastal locations. The clearing of this front brought showery conditions to the north of Scotland pushing inland by dawn. Elsewhere it was a dry night with light winds and rather low cloud cover, with parts of the southeast experiencing widespread fog patches. Low pressure sat to the northeast of the country through the day, bringing northerly winds. The cold front continued to push south through the day with a band of rain along the front, heaviest in Northern Ireland and along the west coast. Behind the front, scattered showers and clearer skies followed, some heavy at times, especially in western and northern Scotland and wintry in the Highlands. During the afternoon the frontal rain became confined to Wales and western England. Central and southern England remained largely cloudy and dry. Wind increased through the day affecting northern Scotland, then western areas.

This day's summary created 02/12/2021 03:04

Summary of the UK Weather for Thursday 25 November 2021

Low pressure sat to the northeast of the UK bringing northerly winds. An occluded front was wrapped around the low and another occlusion sat to the north. These fronts brought showers to Scotland, Northern Ireland and the northeast coast of England. The cold front situated across the south continued to move southwards this brought a band of thick cloud and showers, which affected the southwest and west Wales. Elsewhere remained largely dry and cloudy. The cold front cleared the southeast early in the morning, leaving a mostly dry and bright morning, with showers off the east coast, in Northern Ireland, and a convergence zone along the Irish sea as well as wintry showers across the Highlands. Cloud moved southwards through the day, before outbreaks of rain reached northwestern Scotland around midday. Winds remained strong off eastern, western and northern coasts, and increased in the north through the day to gales or severe gales. The rain in the north continued and moved south and east to cover Scotland and northern England through the evening.

Summary of the UK Weather for Friday 26 November 2021

Storm Arwen started the day to the northeast of the UK which brought rain, locally heavy, to most of the country during the early hours as it moved south so that by dawn most of the country was reporting rain. These showers turned wintry over the Highlands and the Lake District. Arwen brought northerly winds to much of the country with the strongest winds and severe gusts affecting northern Scotland, and the east and west of England, with strong winds moving south through the Irish Sea. It remained cloudy across the country through the early hours. Western Scotland and northern England experienced respite from the heavy rainfall around midday before Storm Arwen continued, bringing heavy rain to Scotland for the remainder of the day. Wales experienced rain all day. Winds continued to gain strength throughout the day, the strongest gusts in Shetland. There were multiple weather warnings for large parts of the country, including a red warning for wind in the northeast. Throughout the day there was snow on higher ground, particularly in Scotland, and hail in southwestern England.

Summary of the UK Weather for Saturday 27 November 2021

Storm Arwen brought strong northerly wind to many parts of the country through the night, with east Scotland and northeast England the worst affected areas, although northwest and west England, and Wales also saw strong wind and rain or showers. This continued through the night as the storm moved southwards, sitting around the south coast by the morning. As the storm passed through areas, much colder air followed it, and many areas saw snow and wintry showers from this, settling in some areas. The red warning expired by 0200 for east Scotland and northeast England, though amber and yellow warnings remained in place. Storm Arwen had a trailing second feature which moved southeastwards through the UK, bringing heavy rain, snow, sleet and strong winds. Southern Scotland had clear skies for most of the day however. The highest recorded gust was 98mph in Brizlee Wood, Northumberland. A yellow warning of wind was still active until 1800, as well as a yellow warning for ice covering northern and southwestern Scotland, northeast and southeastern areas of England, Orkney and the Shetland Islands.

Summary of the UK Weather for Sunday 28 November 2021

Showers persisted through early morning along the east coast, the remnants of Storm Arwen slowly moving to the east of England. The southeast, south coast and southwest experienced breezy conditions and gusts overnight. Longer spells of precipitation, mostly snow in highland areas, moved into northern Scotland early, continuing overnight. Central and southern areas saw clear spells early in the night and after a cloud band moved through, a section of clear sky stretched from northeast England to the south and east coasts, while the southwest, Wales, northwest and Scotland remained covered. Cold for most, if not all, through the night. Snowfall continued as an occlusion moved southeastward toward London through much of the day, bringing widespread snowfall to northern England, with the heaviest in Manchester and Sheffield. The snowfall lessened on approach to London into the evening, becoming rain at low-levels further south. Elsewhere in the south, many experienced a bright day with plenty of sunshine. Very cold for many, becoming colder at dusk due to northerly winds and clear skies.

Summary of the UK Weather for Monday 29 November 2021

Heavy precipitation and cloud cover travelled southeastwards over the UK in the early hours, showers over the eastern coast, consistent precipitation over Northern Ireland and Scotland, before reaching Wales by dawn. The southwest and Central England remained dry. Most areas of the UK experienced sub-zero temperatures and widespread frost. Ice also was prominent along the central line of the UK and into Scotland, particularly over fallen snow. The early heavy precipitation from the north moved southeastwards throughout the day, covering most of the UK, with central and some eastern parts remaining dry. Heavy rainfall was experienced over the eastern coast and areas of northwest Scotland, this accompanied by strong gusts. Thick cloud remained over these areas, despite temperatures being of single figures.

This day's summary created 07/12/2021 03:03

Summary of the UK Weather for Tuesday 30 November 2021

Heavy precipitation began over northern Scotland at midnight and moved southeastwards through the early hours, showers reaching most of Scotland and the southwest of England, heavier precipitation over western Wales, southeast England, and northern England. Thick cloud covered most of the UK by dawn, bringing with it warmer temperatures than previous early mornings, most places besides northern Scotland in double digits. A weather front moved southeastward through the day bringing some locally heavy rain to parts of western Scotland, pushing into the north of England by midday, with light rain and drizzle experienced in Northern Ireland and southeastern coasts of England. There were some breaks in the cloud giving some brief sunny spells to the west but most of the UK experienced cloudy conditions through the day. Through the afternoon a further band of heavy rain pushed eastward making landfall in Northern Ireland and western Scotland. This continued to push eastward reaching Wales and the northwest of England by early evening, then reaching the southwest of England by nightfall.

Daily Weather Summary for Tuesday 30 November 2021

Daily Weather Summary for Tuesday 30 November 2021

Guidance Notes

UTC = Universal Coordinated Time. For the UK UTC is the same as GMT (Greenwich Mean Time).

National boundaries shown on the European station map are for illustrative purposes only.

Daily extremes

- Daily extremes have been manually confirmed by Met Office Observations Quality Management as valid observations from the live database at the time of checking. However, more extreme values may still be possible if they occur after the time of production.
- Mountain stations above 500 masl are excluded from lowest temperatures, highest gust speeds and greatest snow depths at 0900 UTC. This is because they are not considered representative of low level areas.
- Counties quoted against each station are based on historical county boundaries pre-1974 and may not reflect current administrative boundaries.

Analysis charts and satellite imagery

- The satellite imagery is infra-red imagery from the geostationary MSG satellite.
- The rainfall image is derived from satellite data from MSG and rain-radar data. This represents a snapshot of instantaneous rain-rates at 0000 UTC and 1200 UTC and so does not necessarily reflect daily accumulations in the rainfall station map.
- Any analysis charts or satellite images which are unavailable will be displayed as white space.

Station maps

- The UK maps show station data for the same set of stations presented UK data table. These stations are selected to provide good spatial coverage across the UK; they represent only a fraction of the overall UK observing network.
- Wind speed maps show wind speed in Kt and direction both averaged over the hour up to the time of observation. 1 Kt = 1.151 mph.

Hourly station data

- The data tables provide spot hourly observations from synoptic messages at 0000 and 1200 UTC. Missing data are denoted by '-'.

- Pressures are mean sea level pressure in hPa.
- For UK stations, Gibraltar and Jersey, the wind speeds and directions are both averaged over the hour up to the time of observation. However, for European stations wind speeds and directions are both averaged over a 10-minute period up to the time of observation.
- Wind speeds are in Kt. Wind directions are stored in the database every 10 degrees and have been converted to the nearest point of the compass. These give the direction the wind is blowing from, not to.
- Cloud amounts are in Oktas from 0 (clear) to 8 (overcast). 9 indicates sky obscured (eg by fog).
- Air temperature and dew point temperature are in Celsius.

Temperature maps

- Daily maximum, minimum and grass minimum temperatures are in Celsius.
- The period for the daily maximum temperature on day D is defined from 0900 UTC day D to 0900 UTC day D+1.
- The period for the daily minimum and grass minimum temperatures on day D is defined as 0900 UTC day D-1 to 0900 UTC day D.
- On any given day D the minimum will typically occur in the early hours of the morning and the maximum in early afternoon.

Rainfall, sunshine and max gust speed maps

- Daily rainfall is in mm from 0900 UTC day D to 0900 UTC day D+1.
- Daily sunshine is in hours from Kipp and Zonen CSD1 automatic sunshine records. Bright sunshine is defined as exceeding 120 W/m².
- Max gust speeds are the daily max gust in Kt from 0000-0000 UTC

Snow maps

- The day of snow falling map displays data from present weather sensors, showing stations which have recorded sleet or snow falling at any point in the day (0000-0000 UTC).
- The snow lying map shows level snow depth as recorded by the automatic snow depth sensors at 0900 UTC. These snow depth sensors do not record snow depth if this is less than 1cm.
- Snow depth sensors are normally operational from October to April, in the event of snow falling outside this period data availability may be limited.
- Snow maps will only be displayed if one or more of the selected stations on that date have recorded either snow falling or non-zero snow depths. If snow maps are not

displayed it is still possible that other stations in the network have recorded a day of sleet or snow falling or non-zero snow depth.
