Daily Weather Summaries for June 2023

If you have any questions or feedback about this product or wish to obtain further data please contact the Met Office.

This document contains daily weather summaries for each day of June 2023. The Met Office National Meteorological Library and Archive holds a continuous record of daily weather summaries or daily weather reports from 1860, and these daily weather summaries form a continuation of that series.

The purpose of each summary is to provide an overview of the weather conditions across the UK on that day, with the historical emphasis mainly based on observations from surface network of weather stations, although the format has varied over the decades. While the emphasis remains on observations from the surface network, the current daily weather summaries supplement these by including satellite and rain-radar imagery to provide a more complete overview. The current format of the daily weather summaries is as follows:

1. Text summary of the main characteristics of the weather during the day, written by an operational meteorologist in the Met Office operations centre.
2. Table of daily extremes for the UK for key climate variables including temperature, rainfall, sunshine and gust speeds.
3. Overview of the synoptic situation at 00 and 12 UTC comprising: analysis charts showing the surface pressure pattern and associated weather fronts; North Atlantic and European infra-red satellite images showing cloud-cover; combined infra-red and rain-radar images of the UK; maps of wind speed and direction at 00 and 12 UTC; observations of pressure, wind speed and direction, cloud cover, air and dewpoint temperature at selected UK and European stations in data tables.
4. UK maps of key climate variables from observing stations including maximum, minimum and grass minimum temperature, rainfall, sunshine, gust speed and snow.
5. Further guidance notes

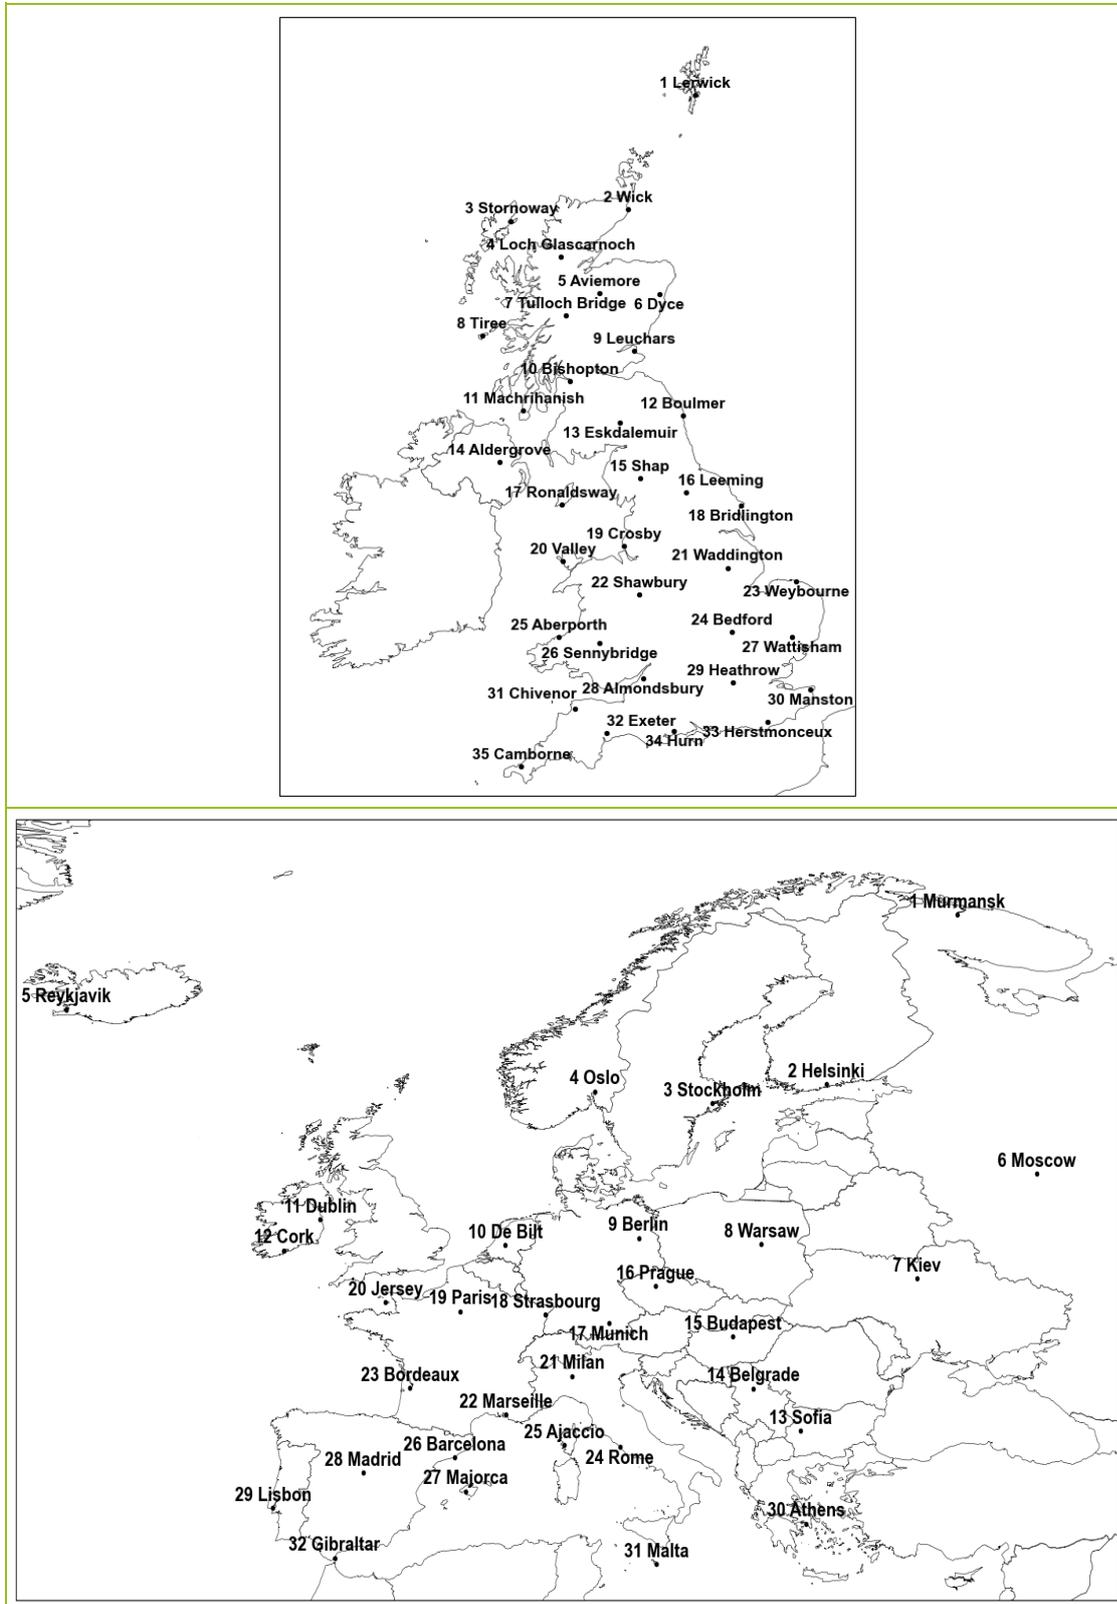

If you spot any data errors or omissions in this product please contact the Met Office.

Daily Weather Summary for Thursday 01 June 2023

This day's summary created 08/06/2023 03:03

Summary of the UK Weather for Thursday 01 June 2023

High pressure continued to dominate to the northwest of the UK, allowing a northeasterly flow to bring cloud off the North Sea to many areas. Western coasts and parts of the southwest and Northern Ireland remained clear into the early hours, but most other areas were overcast. Some northeastern coastal areas saw very isolated spots of drizzle around dawn. Temperatures dropped most quickly under the clear skies. A weakening cold front made its way over the northeast of the UK. A small amount of precipitation occurred in the northeast of the country ceasing around midday. Otherwise, dry for most areas. Warm temperatures for most, especially along the west where temperatures were above average. Generally clear skies in the southwest of the country during the afternoon, but cloudy over the east with sunny spells in southeast England. During the evening, cloud began to move back westwards over central areas of the UK, producing a few spots of drizzle in the southeast.

Daily Weather Summary for Friday 02 June 2023

This day's summary created 09/06/2023 03:03

Summary of the UK Weather for Friday 02 June 2023

Overnight, high pressure remained centered near the north of the UK with light winds for many, and a more moderate northeasterly breeze towards the southeast. A weakening cold front continued to move southwestwards across England. Cloud spread to most of the UK with far western areas, parts of Northern Ireland and parts of Scotland remaining clearer. It was locally cold in the northeast of Scotland under clear skies. Settled conditions were observed for most of the day. Overall dry conditions for the UK, with some precipitation development off the northwest coast. Cloudy for most of the country during the early morning. As the day progressed, clouds layers started to break up leading to sunny skies by the afternoon and evening. It remained warm for most areas with a light breeze towards the southeast.

Daily Weather Summary for Friday 02 June 2023

Daily Weather Summary for Saturday 03 June 2023

This day's summary created 10/06/2023 03:03

Summary of the UK Weather for Saturday 03 June 2023

It was a dry night across the UK, with some patchy cloud making its way inland in the far northwest of Scotland and across parts of central and southeastern England and Northern Ireland in the early hours of the morning. Elsewhere remained largely clear through much of the night. Under the cloud, temperatures generally remained in high single figures but areas exposed to clear skies experienced a chilly night with isolated ground frost, especially in parts of northern England. Winds were generally light across the UK, though they strengthened slightly over southern and central areas of England as the night progressed. The weather for most of the day was generally settled and dry with plenty of sunshine. Cloudy for most of Scotland and a few clouds passing by in the South of England. The temperature remained warm for most areas with light winds.

Summary of the UK Weather for Sunday 04 June 2023

High pressure remained the predominant feature during the period. Light easterly winds over northern and central parts of England were observed, becoming slightly stronger on the south. Starting with clear skies for most areas, cloud development could be found in some parts of Scotland and southern England during the evening. As the night progresses cloud developed over southeast/central England, while most areas in the west of the country remained clear. Overall dry during the evening and night, but precipitations were observed over the Atlantic Ocean, the North sea and isolated areas within central Scotland. During the day, low cloud in some eastern counties and parts of the midlands retreated from some areas, although parts northeast England remained cloudy. There was also some low cloud lingering in the far northeast of Scotland and Northern Ireland, and fair weather cloud bubbled up over the high ground of Scotland. Otherwise, it was a widely sunny day. Temperatures were warm in many western and central areas, while remaining cooler in the east.

Daily Weather Summary for Monday 05 June 2023

This day's summary created 12/06/2023 18:16

Summary of the UK Weather for Monday 05 June 2023

High pressure remained the most influential feature to the northwest. Overall settled and dry conditions were observed for most of the UK, although it was a cloudy start for eastern and central parts, keeping temperatures milder here. Western and southern coastal areas remained mostly clear, with early morning sunshine here. Light north-easterly winds were dominant across the board but stronger towards the southeast. During the day, the cloud burned back towards the North Sea coasts, however parts of the East Midlands, East Anglia, and NE Scotland remained cloudy along with other eastern coastal fringes. Some patchy fair weather cloud also bubbled up over the uplands of southern Scotland, the far Northern England and Northern Ireland. Otherwise, it was another sunny day for many.

Daily Weather Summary for Tuesday 06 June 2023

This day's summary created 13/06/2023 03:03

Summary of the UK Weather for Tuesday 06 June 2023

The high pressure continued to loom over UK, bringing dry and clear conditions for many, however, some light drizzle in northeastern England. It was a cloudy start for the majority of the country with light winds, stronger at the southeastern coast. The day started dull for most with the exception of the far west. The cloud burnt off during the day leaving only eastern coasts with cloud cover by the evening. The cloud spread westward again through the night. Winds were generally light, with stronger periods on western coasts. More persistent in the northwest. Through the day, temperatures were warm in the sun, but cooler in the east under the cloud. With nightfall, the clear areas cooled quickly with low single figures. Temperatures under the cloud stayed higher.

Daily Weather Summary for Wednesday 07 June 2023

This day's summary created 14/06/2023 03:02

Summary of the UK Weather for Wednesday 07 June 2023

High pressure was retreating slightly to the north of the UK, however settled conditions persisted across the country. It remained dry for most, however, some drizzle was seen in central and eastern England. It was a cloudy start across the majority of the country with light winds, stronger along the east coast. There were some locally chilly temperatures for the start of the day where skies were clear. The overnight cloud which covered much of the UK in the early morning burned back towards the eastern coasts over the course of the day. The cloud persisted in eastern and northern areas of England and Scotland, leaving these areas cooler than southern and western regions. However, it stayed dry across the whole of Britain. Temperatures were highest in the southwest, where the best of the sunshine was experienced. Winds were generally light, though stronger across southern parts of England.

Summary of the UK Weather for Thursday 08 June 2023

Overnight, high pressure was centred to the north, and low pressure to the south, with an easterly breeze getting slightly stronger in the south. It was a dry night, with cloud once again moving inland over many eastern and central areas, with western and southern coastal counties remaining mostly clear. There was also some cloud approaching Cornwall with rain not too far off the southwest. Many areas were not especially cold, however it was locally cold in northeast Scotland. Through the remainder of the day high pressure was the dominant feature across the UK, overnight cloud slowly burnt back through the day lingering on the north east coast and across Scotland. Overall dry for most with sunny spells in parts of central and southwest England. As the day progresses temperatures were again above average in the south and west, and cooler in the east. Moderate easterly winds remained consistent throughout the day, strong in the far southwest.

Daily Weather Summary for Friday 09 June 2023

This day's summary created 16/06/2023 03:02

Summary of the UK Weather for Friday 09 June 2023

High Pressure was centered to the north of Scotland, with low pressure to the southwest, generating a moderate breeze in the south and southwest, and light winds in Scotland. During the early hours, cloud advanced westwards from eastern to central areas of the UK. With an occluded front approaching, there was also more cloud in the southwest with a few showers over Cornwall. The rest of the west remained largely clear. It was locally cold in northern Scotland, and milder elsewhere, particularly in southwest England. The minimum temperature was -0.1 degrees Celsius at Altnaharra No. 2, Sutherland. The overnight cloud burned off towards the eastern coasts during the morning. Showers approached the far southwest during the afternoon as low pressure proceeded to move northwesterly; elsewhere was largely clear and sunny. Daily temperatures were depressed on eastern coasts but were very warm elsewhere, particularly in southwest England and southern Wales. Winds generally remained light throughout, though moderate in the southwest. The maximum recorded temperature was 29.7 degrees Celsius, recorded at Porthmadog, Gwynedd.

This day's summary created 17/06/2023 03:03

Summary of the UK Weather for Saturday 10 June 2023

Low cloud once again spread from the north sea over eastern and central areas over the course of the night. Western regions generally remained clear, except for parts of Cornwall and Devon which saw scattered showers, some heavy, overnight and into the early morning. Despite the clear skies, southern and western areas in particular remained warm and humid, but eastern areas experienced a cooler night, particularly in eastern and central Scotland. The showers in the southwest continued until early afternoon, with affected regions covered by cloud. The showers and cloud shifted north later in the day, affecting parts of Wales and Northern Ireland in the afternoon and evening. The overnight cloud over central and eastern UK cleared by mid-morning. Lightning, with accompanying thunderstorms, was observed in the southwest and west midlands in late afternoon and in parts of northwest England and southern Scotland into the evening. It was a warm day for most of the UK with the highest temperatures recorded in central and southeastern parts of England.

Summary of the UK Weather for Sunday 11 June 2023

Rain and showers continued to affect parts of western UK overnight, working their way northwards into western Scotland in the early morning. Most convective activity died away before midnight however. The western side of Britain also saw substantial cloud cover through much of the night, with patchier cloud in eastern and southeastern areas. Overnight temperatures remained warm, particularly in the south, but some eastern coastal areas did see dips below 10 degrees Celsius. The day started with showers in the north of UK shifting away and some rain showers gradually moving more inland into the Pennines from the south, caused by occluded front which also brought clouds for most parts of the UK moving northwards. Light easterly winds were dominant most of the day. Thunderstorms and lightning also occurred throughout UK.

This day's summary created 19/06/2023 03:02

Summary of the UK Weather for Monday 12 June 2023

Into the evening, the northeast of the UK was mainly influenced by high pressure. Southeasterly winds were observed for most of the period. Low cloud developed along the southwest coast and part of central Scotland, persisting as the night evolved. Precipitation occurred over central and north England areas as well as the far north of Scotland. This was accompanied by lightning observation on central and north areas of the country. As the night progressed, rain shifted to the southwest with showers for some. Warm and humid for majority of areas, especially on the south. The day started dull for most, but this gradually cleared through the morning to give dry and bright weather. Troughs brought showers with some thunderstorms to parts of northern Scotland, Wales and the Midlands. There were locally heavy. Into the evening the showers dissipated to give a dry evening for most. Winds were generally light, but gusty with the showers. It was a hot day for most, a little cooler on the east coast with a cool SSE breeze off the sea. It remained warm into the night with places staying in the high teens, or even 20s.

This day's summary created 20/06/2023 03:02

Summary of the UK Weather for Tuesday 13 June 2023

Heading into the night, most of the UK had a dry and clear night apart from the West Midlands, part of Wales and northern Scotland where rainfall occurred. Over the night, the rain has shifted away from mainland UK, leaving behind some showers along the west coast of England and east of Scotland. Wind was generally light and temperature stayed warm. Low cloud and fog persisted in the far southwest of England and mist in the north of Scotland throughout the morning, but this mostly burned back by midday. Lightning strikes caused by high level instability were detected over the Irish Sea, and showers remained offshore for a time pushing northwestwards. Most of the UK remained dry and fine, with temperatures generally in the mid to high twenties. Thunderstorms broke out in the early afternoon throughout northern and western Scotland, as showers became thundery soon after in Northern Ireland - both persisted into the evening. The western coast of the mainland UK saw some patchy midlevel cloud bubbling up in the evening.

Daily Weather Summary for Wednesday 14 June 2023

This day's summary created 21/06/2023 03:02

Summary of the UK Weather for Wednesday 14 June 2023

A weak warm front brought fog and drizzle to the Western Isles, which persisted through the period. Otherwise, most had a dry and clear night leading to a bright, sunny morning. Winds were light, generally northeasterly, but variable in the north. It was a warm night, with temperatures staying in the mid to high teens for most. Cooler for some. The day dawned clear and sunny for most. During the day, most of the country continued to be dry and sunny. Around midday and early afternoon, a few isolated heavy showers and thunderstorms formed over the far north of Scotland. There was also some fair weather cumulus over central and southern areas during the afternoon but still with good sunny spells. It was another very warm day for most of the country, cooler on the east coast.

This day's summary created 22/06/2023 09:52

Summary of the UK Weather for Thursday 15 June 2023

It was a clear, dry night for most. The Western Isles had some rain, but this soon cleared. Dawn brought a dry sunny morning for most with some patchy light cloud in the south. Winds were light from a NEN direction. More variable in Scotland as the winds circulated around the high-pressure centre located over the highlands. It was another warm night, with temperatures in the mid to high teens for many. Any lingering overnight cloud quickly burned off in the early morning, leaving much of the UK clear for most of the day with light winds. Some scattered cloud started to infiltrate over the east of England and parts of western Wales late morning, with further development of scattered high cloud over central England and southwest Northern Ireland over the afternoon. A few convective showers also developed in western Wales in the midafternoon, some of these turning thundery. A warm day across the UK, particularly in the south.

Summary of the UK Weather for Friday 16 June 2023

Any remaining showers over west Wales quickly died out to leave a dry night for most of the UK. Whilst some high cloud remained over western areas there were plenty of clear skies for western areas. Through the early hours some mist and fog began to push in off the North Sea affecting eastern coasts, whilst in the far southwest there was the occasional spot of rain. Light southerly winds were predominant throughout the day. Over the course of the day, cloud and scattered showers spread across parts of the western and central UK. Although slightly cooler than previous days, it remained fairly warm for most areas especially on central and western England. Eastern and northern parts of the country remained largely dry and clear during the day. Into the evening, thundery showers spawned over southwest Scotland, triggering a yellow thunderstorm warning.

This day's summary created 24/06/2023 04:02

Summary of the UK Weather for Saturday 17 June 2023

A low pressure system approached the UK from the west, driving cloud over western parts of the British Isles overnight, which spread further east into the early morning covering the southwest of England, Wales, Northern Ireland, and parts of northern England, southwest Scotland and the west Midlands. Frontal rain and showers also affected parts of Northern Ireland and southwest Scotland during the night, much of the rest of the UK remained dry however. Under the clouds, temperatures remained elevated, but eastern parts of the country, especially in coastal regions, were cooler. The day started off to be cloudy for most with the exception of Wales and southwest and northern Scotland. As the day progressed, clouds dissipated and headed northeastwards. As the low pressure that brought an occluded front passing through the country, it has also brought a band of rainfall that passed through from the southwest northeastwards that slowly dissipated into showery rainfalls. The winds were generally light across the country and temperature stayed warm.

Summary of the UK Weather for Sunday 18 June 2023

The southwest of the country was broadly affected by low pressure. Southerly winds were predominant throughout the period. As the night progressed cloud along with some locally heavy showers and a few thunderstorms moved northwards, with these affecting parts of the southeast England, the midlands, northwest England, and the far west of Scotland. Overall warm temperatures were recorded, although cooler for some areas. The morning dawned with a mixture of cloud and sunny spells across the country, as well as some showers with the odd lightning strike being detected. During the day, scattered heavy showers and thunderstorms began to break out, starting in Wales and then the Midlands, with these areas most affected during the afternoon along with a few in the west of Northern Ireland and southwest England. Rain also moved into the southeast. Meanwhile, Scotland was mostly dry. During the evening, sunniest in the north. During the evening, these showers and thunderstorms began to merge into a heavy band of rain and push northwards.

Daily Weather Summary for Monday 19 June 2023

This day's summary created 26/06/2023 04:02

Summary of the UK Weather for Monday 19 June 2023

Heading into the night, a band of rain moved north, out of northern England and Northern Ireland and into Scotland, bringing moderate to heavy rainfall to many areas here. This was caused by the low pressure on the west side of UK, with a new centre forming over the UK a trough and occluded front pushing north overnight, with the previous day's thunderstorms merging to form the rain band. There were also a few showers further south across England and Wales. Overall, temperature stayed warm. The morning dawned with the rain band across northern and central Scotland, and some showers in southwest Scotland, Northern Ireland, northwest England, and Wales. Elsewhere there was patchy cloud and areas of sunshine, clearest in the east. During the day, the south was mainly dry with sunny spells, while further north showers bubbled up, becoming heavy and thundery in places with lightning detected in Northern Ireland, Northern England and Southern Scotland. The north of Scotland was still affected by the area of low pressure and occluded front, with longer outbreaks of rain across the northwest and the Northern Isles.

This day's summary created 27/06/2023 04:03

Summary of the UK Weather for Tuesday 20 June 2023

Through the night, rain fell over the southwest of UK and moving into central UK. However, for most, it remained dry with light winds. The temperature remained mild for many. A thick band of frontal rain and showers moved northwest from the southwest of England across central and southeast England and Wales during the morning. Embedded thunderstorms were reported, particularly in the southeast. The band of rain moved into northeast England and southern and eastern parts of Scotland into the afternoon and had largely cleared into the North Sea by early evening. Meanwhile a trough moved west to east across Northern Ireland, bringing a large amount of convective thunderstorms. Further thunderstorms and showers were also reported in northwest Scotland throughout the afternoon, as well as in the far southwest of England. During the evening, scattered showers and a few thunderstorms occurred in southwest and central England, western Scotland, and Northern Ireland. Temperatures were slightly lower than in recent days, warmest in southeast England and coolest in eastern Scotland.

Summary of the UK Weather for Wednesday 21 June 2023

Overnight, most showers faded away to leave many areas dry by the early hours, A patch of showers lingered at first in the Midlands, but these faded away to leave it mostly dry apart from a few showers near some western coasts (especially Northern Ireland). Some mist and fog patches formed in places. Despite light winds and clear spells, it was a mild night for many. It remained a fine and dry day for most across the UK; however showers developed through the day, mostly across the west, stretching the length of the nation. These spread further east through the morning. By lunchtime the heaviest of these showers were in the east, north and north east of England, with some thunderstorms developing here. A south westerly breeze affected most of the country throughout the day.

Daily Weather Summary for Thursday 22 June 2023

This day's summary created 29/06/2023 04:03

Summary of the UK Weather for Thursday 22 June 2023

A largely quiet weather night for the UK. A few isolated showers passed over the far north of Scotland in the early hours and some scattered cloud crept in over the Midlands and parts of Yorkshire. Towards the early morning, patches of low mist and fog covered parts of southern and western England and Wales. Southeastern parts of England saw a fairly warm and calm night, but it was much cooler in northern England and particularly parts of northwest Scotland and western Northern Ireland; winds were also light in these areas. High pressure was the dominant feature, especially over the north of the country. Overall dry for most; however central England experienced rain and thundery showers as fronts moved across the UK. While it was a mild start, the UK warmed considerably during the day, particularly in southern area. Westerly winds were observed for most of the period.

Summary of the UK Weather for Friday 23 June 2023

A frontal system brought heavy rain and showers into Northern Ireland and Western Scotland in the early morning, but elsewhere remained generally dry throughout the night. Patchy low cloud covered parts of southwest England and eastern coastline, with the frontal system bringing more cloud in from the west by early morning. However, large parts of southeast England remained clear for most of the night. It was another warm night for many, particularly in southern and central England, although northern and eastern Scotland were a little milder. Predominantly light winds aided a humid feel for many. Showers continued moving eastwards through the morning, affecting Wales, Northern Ireland, Scotland and northern England. Sunny spells were intermittent through the day across the UK. Showers were particularly heavy in western Scotland, these dissipated through the afternoon before returning in the evening and continuing overnight. Meanwhile, skies cleared into the night across southern England.

Daily Weather Summary for Saturday 24 June 2023

This day's summary created 01/07/2023 04:03

Summary of the UK Weather for Saturday 24 June 2023

Friday evening was characterized by the eastward movement of fronts across the country. This allowed for low cloud and bands of precipitation development over most of northern England, Scotland and Northern Ireland. Widespread humid and warm conditions were experienced as the period evolved, with peak temperatures recorded over southeastern parts. At the same time, southern England was influenced by high pressure resulting in sunlight at times for some areas. Westerly winds were observed throughout the period. The precipitation continued into the day for most of Scotland which experienced showery rainfall throughout the day and some isolated shower fell across central and western England as well as Wales at times. The rest remained dry and settled with light clouds across the country due to the low pressure and high pressure sitting above and below Britain respectively. Light southwesterly winds bringing moist air throughout the country from the cold fronts occurring above the Atlantic Ocean. The temperature remained warm.

This day's summary created 21/07/2023 13:25

Summary of the UK Weather for Sunday 25 June 2023

Fronts remained a very influential weather feature during Saturday evening. Bands of precipitation moved in a northeastward direction, pushed by the strong to moderated winds that were taking place over northern parts of the UK. This allowed for showers and rain over Northern Ireland and Scotland. Dry for some, however showers and rain occurrence were observed in north and central parts of England. Partially cloudy at first, but as the period progressed cloud broke up resulting in sunny spells for various parts of the country.

Temperatures remained warm for most, especially in southern areas. During the day, a cold front progressed steadily eastwards, bring a band of rain to Northern Ireland in the morning, followed western Scotland and the far north of England. Heavy showers and thunderstorms broke out across northwest and northeast England, the far east of Scotland, and also behind the front in Northern Ireland. An increasing breeze also picked up in southern areas. Ahead of the front, it was hot for many southern, central and eastern areas.

Daily Weather Summary for Monday 26 June 2023

This day's summary created 03/07/2023 04:03

Summary of the UK Weather for Monday 26 June 2023

As the cold front has travelled across the country, clear skies and a dry night was experienced by most. However, a few showers occurred in northern areas of the UK brought by a trough. Generally light westerly winds across most areas. The temperature was cooler than recently. During the day, many areas started dry with clear conditions in many places, and a few showers in western parts. During the day, showers bubbled up across many central and northern areas, turning thundery in northeast Scotland. There were sunny intervals between the showers in many places and the south stayed mostly dry, with a bit of thin high cloud here. There was a generally moderate breeze blowing from the west, and it was cooler and fresher than recent days.

Daily Weather Summary for Tuesday 27 June 2023

This day's summary created 04/07/2023 04:03

Summary of the UK Weather for Tuesday 27 June 2023

As the low pressure zone shifted closer to the country, most experienced a dry cloudy sky, although isolated showers occurred around the country. However, northwestern England and western Scotland experienced continuous rainfall that were brought in from the Atlantic Ocean moist air. Generally light westerly winds across most areas. Temperatures were generally around average but above in some western areas. Over the course of the day a warm front passed across northern England, Scotland and Northern Ireland, bring widespread rain, showers and cloud. Scattered showers also spread across parts of Wales and the Midlands over the morning. Southern areas, particularly in the east remained dry, but still largely overcast. Winds were generally moderate, slightly higher in the west, particularly close to coast. Temperatures were lower than over the weekend, generally not far from average, although northern parts of England and Scotland were cooler.

Daily Weather Summary for Wednesday 28 June 2023

This day's summary created 05/07/2023 04:09

Summary of the UK Weather for Wednesday 28 June 2023

It remained cloudy overnight for many areas. Low cloud led to some hill fog in places, and some patchy drizzle. Winds were generally light and from the south west, slightly stronger near the coast in Wales. It was a very mild/warm night for many, especially in England and Wales. A cold front swept across Northern Ireland and western Scotland during the morning bringing heavy rain to some parts and a cloudy start to the day for many. Into the afternoon, the front moved southeastward, over eastern Scotland and northern and central parts of England and Wales, and into southwest England in early evening. Scattered thunderstorms were reported in parts of northwest and northeast England during the afternoon. Behind the front, skies cleared slightly over western areas, bringing in cooler air that depressed temperatures over much of Scotland throughout the day. Winds were light to moderate through the day, veering slightly across the front from southwesterly to more of a westerly or northwesterly. Some strong gusts were recorded close to the front.

Daily Weather Summary for Thursday 29 June 2023

This day's summary created 06/07/2023 12:55

Summary of the UK Weather for Thursday 29 June 2023

Overnight, the cold front moved slowly southeastwards, lying from approximately Devon to Lincolnshire at Midnight. Outbreaks of rain along the front intensified across central and southeastern areas in the early hours (although the southwest saw little), with some embedded thunderstorms forming. Ahead of this band, it was a very mild night, with temperatures in the high teens in parts of the southeast. Behind the front, cooler, clearer conditions developed. A trough brought an increase in showers to western Scotland. Winds were generally light, westerly ahead of the front, and northwesterly behind. Low pressure dictated the morning weather, especially over northern parts of the UK. Rain and showers occurred in central and western Scotland throughout the day while a cold front generated bands of precipitation for central and southeastern parts of England. Western and southeast areas dawned cloudy, but clearing over the day allowing for dry, sunny spells for most. Moderate northwesterly winds were observed during the day. Temperatures remained close to average for most, with peaks over central and western England.

This day's summary created 07/07/2023 04:28

Summary of the UK Weather for Friday 30 June 2023

A succession of occlusions moved eastward across Scotland and Northern Ireland overnight bringing outbreaks of showers and rain and scattered cloud. These showers had largely cleared the east coast by morning. Most of England and Wales remained dry and mostly clear initially with cloud advancing from the west as the night progressed. In the early morning, further rain and showers approached from the west, passing over Northern Ireland before sunrise and into Wales and western England. Temperatures remained warmest in the south overnight. This continued through the day with the weather influenced by frontal activity. Two warm fronts moved eastwards across the country throughout the day. This generated bands of precipitation in many places; Scotland, Wales, central and western parts of England were broadly affected by this. Overall it was cloudy for most, with some sunny spells between the showers, particularly in the southeast. Moderate westerly winds were observed throughout the period, becoming slightly stronger in the north. Temperatures remaining close to average, with peaks found in southern England.

Guidance Notes

UTC = Universal Coordinated Time. For the UK UTC is the same as GMT (Greenwich Mean Time).

National boundaries shown on the European station map are for illustrative purposes only.

Daily extremes

- Daily extremes have been manually confirmed by Met Office Observations Quality Management as valid observations from the live database at the time of checking. However, more extreme values may still be possible if they occur after the time of production.
- Mountain stations above 500 masl are excluded from lowest temperatures, highest gust speeds and greatest snow depths at 0900 UTC. This is because they are not considered representative of low level areas.
- Counties quoted against each station are based on historical county boundaries pre-1974 and may not reflect current administrative boundaries.

Analysis charts and satellite imagery

- The satellite imagery is infra-red imagery from the geostationary MSG satellite.
- The rainfall image is derived from satellite data from MSG and rain-radar data. This represents a snapshot of instantaneous rain-rates at 0000 UTC and 1200 UTC and so does not necessarily reflect daily accumulations in the rainfall station map.
- Any analysis charts or satellite images which are unavailable will be displayed as white space.

Station maps

- The UK maps show station data for the same set of stations presented UK data table. These stations are selected to provide good spatial coverage across the UK; they represent only a fraction of the overall UK observing network.
- Wind speed maps show wind speed in Kt and direction both averaged over the hour up to the time of observation. 1 Kt = 1.151 mph.

Hourly station data

- The data tables provide spot hourly observations from synoptic messages at 0000 and 1200 UTC. Missing data are denoted by '-'.

- Pressures are mean sea level pressure in hPa.
- For UK stations, Gibraltar and Jersey, the wind speeds and directions are both averaged over the hour up to the time of observation. However, for European stations wind speeds and directions are both averaged over a 10-minute period up to the time of observation.
- Wind speeds are in Kt. Wind directions are stored in the database every 10 degrees and have been converted to the nearest point of the compass. These give the direction the wind is blowing from, not to.
- Cloud amounts are in Oktas from 0 (clear) to 8 (overcast). 9 indicates sky obscured (eg by fog).
- Air temperature and dew point temperature are in Celsius.

Temperature maps

- Daily maximum, minimum and grass minimum temperatures are in Celsius.
- The period for the daily maximum temperature is defined from 0900 UTC on the day in question to 0900 UTC the following day.
- The period for the daily minimum and grass minimum temperatures is defined as 0900 UTC the previous day to 0900 UTC on the day in question.
- On any given day the minimum will typically occur in the early hours of the morning and the maximum in early afternoon.

Rainfall, sunshine and max gust speed maps

- Daily rainfall is in mm from 0900 UTC on the day in question to 0900 UTC the following day.
- Daily sunshine is in hours from Kipp and Zonen CSD1 automatic sunshine records. Bright sunshine is defined as exceeding 120 W/m².
- Max gust speeds are the daily max gust in Kt from 0000-0000 UTC

Snow maps

- The day of snow falling map displays data from present weather sensors, showing stations which have recorded sleet or snow falling at any point in the day (0000-0000 UTC).
- The snow lying map shows level snow depth as recorded by the automatic snow depth sensors at 0900 UTC. These snow depth sensors do not record snow depth if this is less than 1cm.
- Snow depth sensors are normally operational from October to April, in the event of snow falling outside this period data availability may be limited.

- Snow maps will only be displayed if one or more of the selected stations on that date have recorded either snow falling or non-zero snow depths. If snow maps are not displayed it is still possible that other stations in the network have recorded a day of sleet or snow falling or non-zero snow depth.
