Hydrological Memoranda No.7

Rainfall of Northern Ireland 1916-1950

1. Rainfall Averages 1916-1950

- 1.1. Introduction. The determination of standard-period averages, for the months and for the year, falls into three phases:- the selection of sound, homogeneous records, complete for the 35 years, 1916-1950, to provide arithmetic means of monthly and annual rainfall, - the basic values for all other work; the estimation of standard-period annual averages for stations with incomplete data; the estimation of standard-period monthly averages for stations in the second group, where these are needed for special purposes.

A detailed account of the methods developed and used in the Meteorological Office (M.O.3) is given in Hydrological Memoranda No.5.

The maps and tables are presented in the most simple and precise forms in order to be of use for a wide range of inquiries.

- 1.2. The Primary Survey of stations with complete records during 1916-1950 included some cases where the site had been changed to one with a better exposure and observations from both sites had been recorded for a few years. Attempts were made to amend the earlier readings, in proportion to the relationship indicated by comparison of the records during the period of overlap, in order to have a set of values from 1916 to the date of the change, which would be representative of the later and better record. But, since the earlier exposures were usually unsatisfactory (being either over-exposed or over-sheltered), the results were mostly erratic and the amended sets of values were not homogeneous. In a few cases, small breaks in a long record were completed by introducing estimated values, based on a nearby station, with or without the use of a modifying factor.

Of the 22 records examined, monthly and annual averages were accepted for 13 stations but were rejected for 9. The accepted values (in inches), together with the proportion (per cent) of each monthly average to the annual average, are given in Table I. All are included in H.M.S.O. publication, M.O.635, 'Averages of Rainfall for Great Britain and Northern Ireland, 1916-1950.'

The percentage proportions of the monthly averages to the annual averages, for the long-period stations, were used to draw a series of 12 monthly maps (figures 1-12), from which it is possible to estimate the percentage of annual average rainfall, for any place, for each of the 12 months. Although the maps are based on only 13 sets of values, supplemented by a few over the border in the Republic of Ireland, it is considered that they provide a good estimate of the overall distribution of rainfall in Northern Ireland, but the absence of data between Belfast and the Sperrin Mountains raises problems in the neighbourhood of Lough Neagh, and some alternative drawing of isopleths is possible.

- 1.3. The Secondary Survey of short-period stations was undertaken next, using records up to and including 1957. The long-period stations whose records were rejected because they were not homogeneous were also included and averages were estimated for the later (and improved) part of the series of observations. Averages based on less than 5 years data were not usually accepted for publication.

/A

A list of these annual averages is given in Table II, together with the Irish Grid reference and altitude for each station. The stations are arranged in an order based on natural drainage areas which will be used for the first time on British Rainfall 1961.

These averages, together with the long-period averages listed in Table I, were used to draw the map of Average Annual Rainfall, 1916-1950. The drawing of the lines near the Border was discussed with the Meteorological Service of the Republic of Ireland. The map is shown as figure 13.

- 1.4. Monthly Averages for a further group of stations were next estimated for use in the Monthly Weather report and for enquiries. For this purpose a network was chosen from the stations listed in Table II to supplement stations listed in Table I. To find these monthly averages, the monthly proportions (per cent of annual average) were chosen from the series of equipercental maps, (figures 1 to 12), so that the total for the 12 months was 100. These values were then used to apportion the annual average, (in inches), amongst the months. The results are given in Table III.
- 1.5. Table IV gives the monthly and annual average values of areal rainfall for the whole of Northern Ireland for the standard period 1916-1950.
- 1.6. Daily averages of rainfall. Six of the initial 13 records which were accepted in the Primary Survey (1.2.) were analysed further. These records had regular daily entries for the 24-hour period, 0900-0900, for each of the years 1916-1950. To this group was added a seventh record, that for Belfast Old Park Filters which, although not homogeneous for the period, gives a sufficiently satisfactory sample of daily catches.

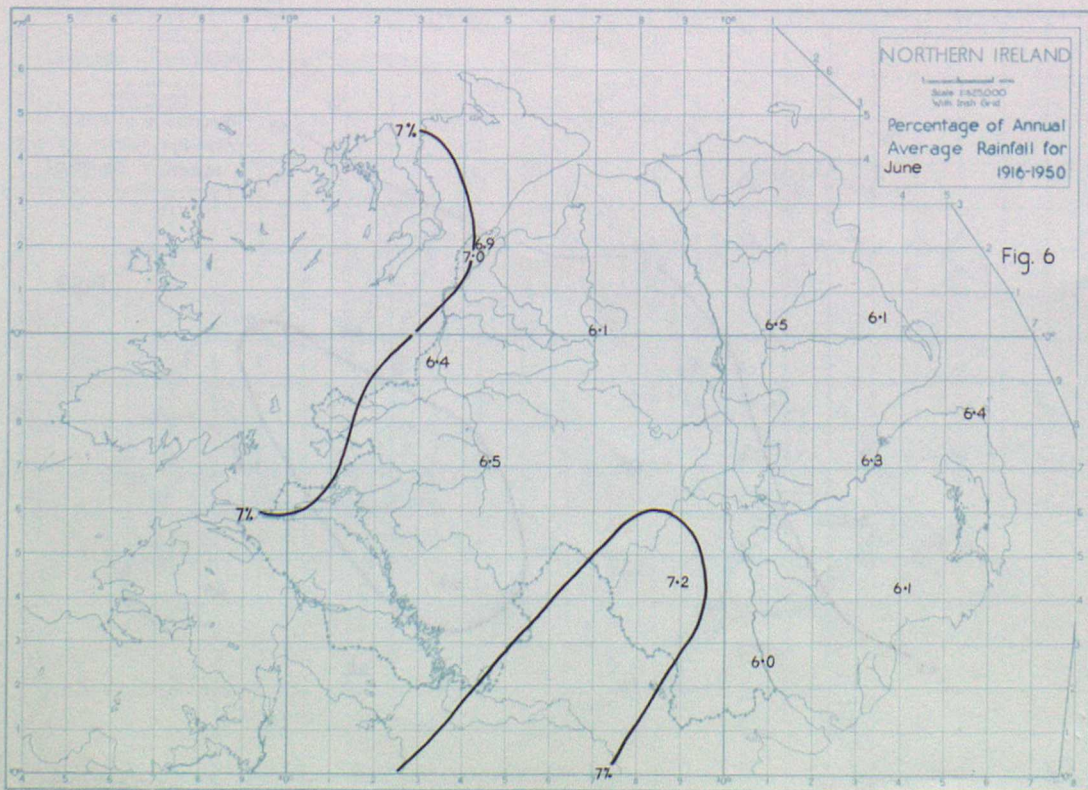

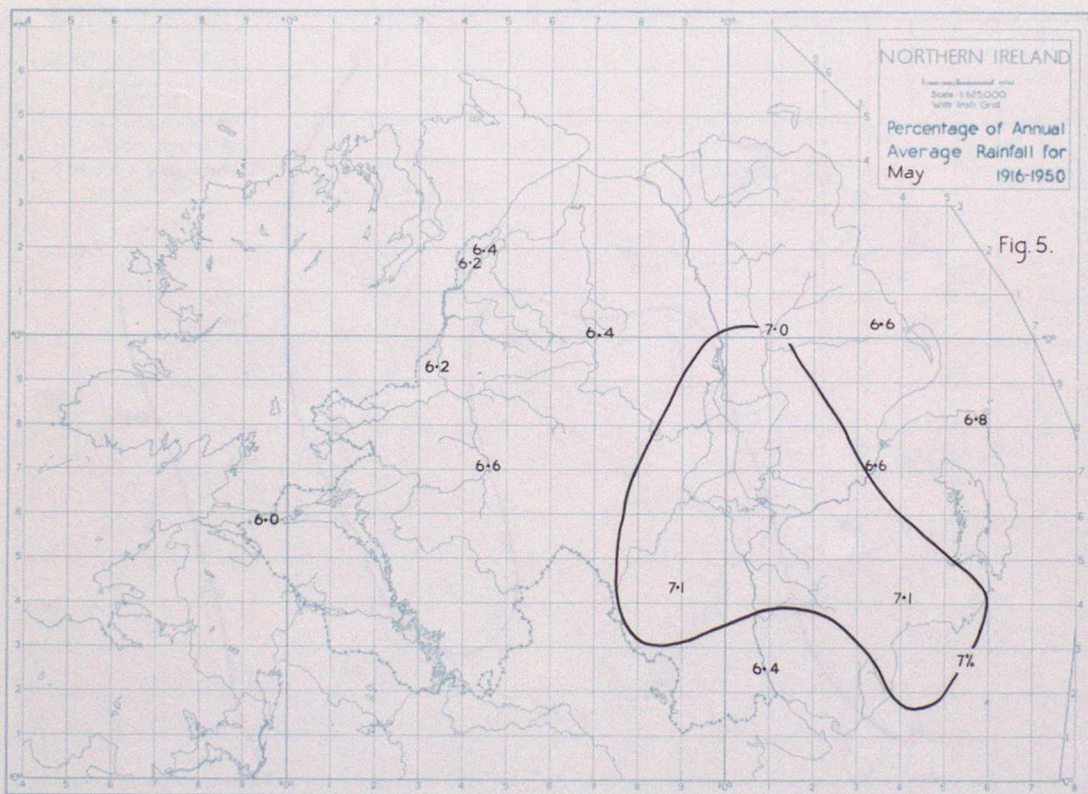

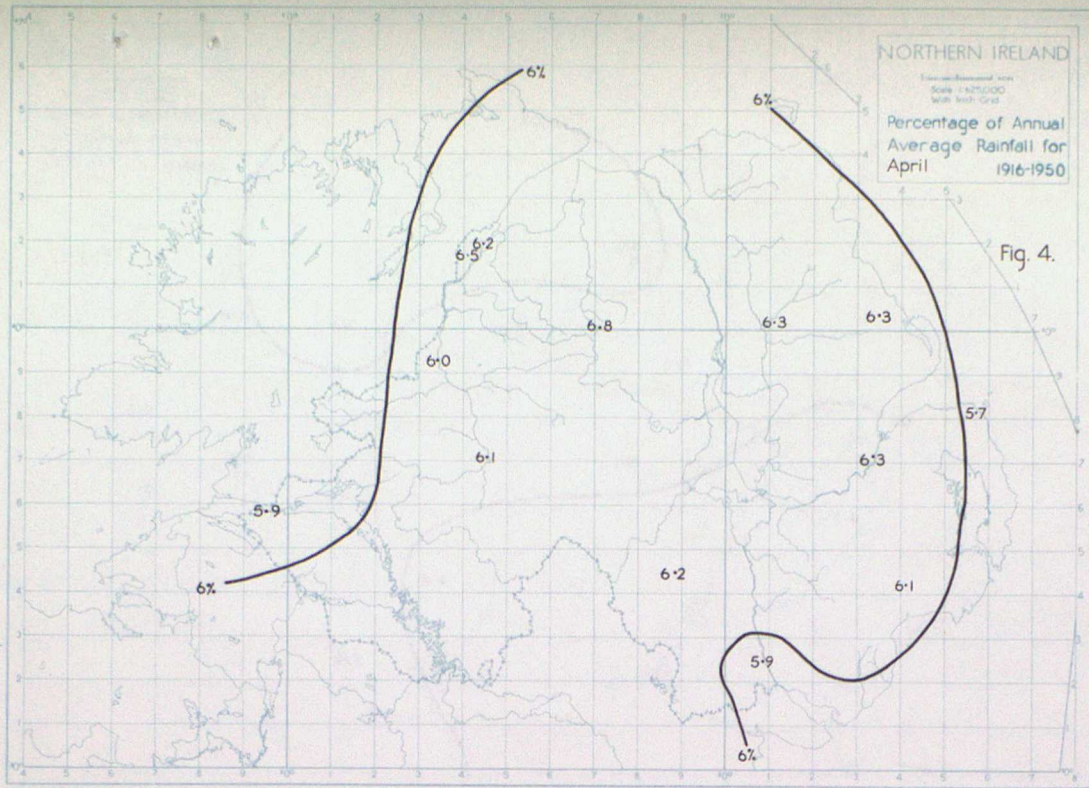

Table Va gives the 35-year totals of rainfall for each day of the year (in inches). Table Vb gives 1/35 of all possible totals from .17 inch to 24.67 thus providing a conversion table for expressing values in Table Va as mean daily falls from trace to .70 inch.

2. Frequencies of daily rainfall. The same set of daily values used for Table Va were re-grouped as frequency tables at intervals of .01 inch. These have been rearranged in a wider grouping with intervals of .10 inch and have already been published as an interim measure, in Hydrological Memoranda No.6. There tables are repeated here under the heading Table VI.
3. Extremes of rainfall. The records for 1916-1950 from the seven stations mentioned in 1.5. and 2. have also been used to find maximum and minimum values for the year and the month and the day. These are shown in Tables VII and VIII.

Further extracts are given for as much as is available of the 50 years 1911-60.

Appendix

Intense falls. All falls of 2 hours or less which rank as 'noteworthy', 'remarkable' or 'very rare' from 1865 to 1960, and have been published in British Rainfall, are listed as Appendix I.
