Daily Weather Summaries for November 2023

If you have any questions or feedback about this product or wish to obtain further data please contact the Met Office.

This document contains daily weather summaries for each day of November 2023. The Met Office National Meteorological Library and Archive holds a continuous record of daily weather summaries or daily weather reports from 1860, and these daily weather summaries form a continuation of that series.

The purpose of each summary is to provide an overview of the weather conditions across the UK on that day, with the historical emphasis mainly based on observations from surface network of weather stations, although the format has varied over the decades. While the emphasis remains on observations from the surface network, the current daily weather summaries supplement these by including satellite and rain-radar imagery to provide a more complete overview. The current format of the daily weather summaries is as follows:

1. Text summary of the main characteristics of the weather during the day, written by an operational meteorologist in the Met Office operations centre.
2. Table of daily extremes for the UK for key climate variables including temperature, rainfall, sunshine and gust speeds.
3. Overview of the synoptic situation at 00 and 12 UTC comprising: analysis charts showing the surface pressure pattern and associated weather fronts; North Atlantic and European infra-red satellite images showing cloud-cover; combined infra-red and rain-radar images of the UK; maps of wind speed and direction at 00 and 12 UTC; observations of pressure, wind speed and direction, cloud cover, air and dewpoint temperature at selected UK and European stations in data tables.
4. UK maps of key climate variables from observing stations including maximum, minimum and grass minimum temperature, rainfall, sunshine, gust speed and snow.
5. Further guidance notes

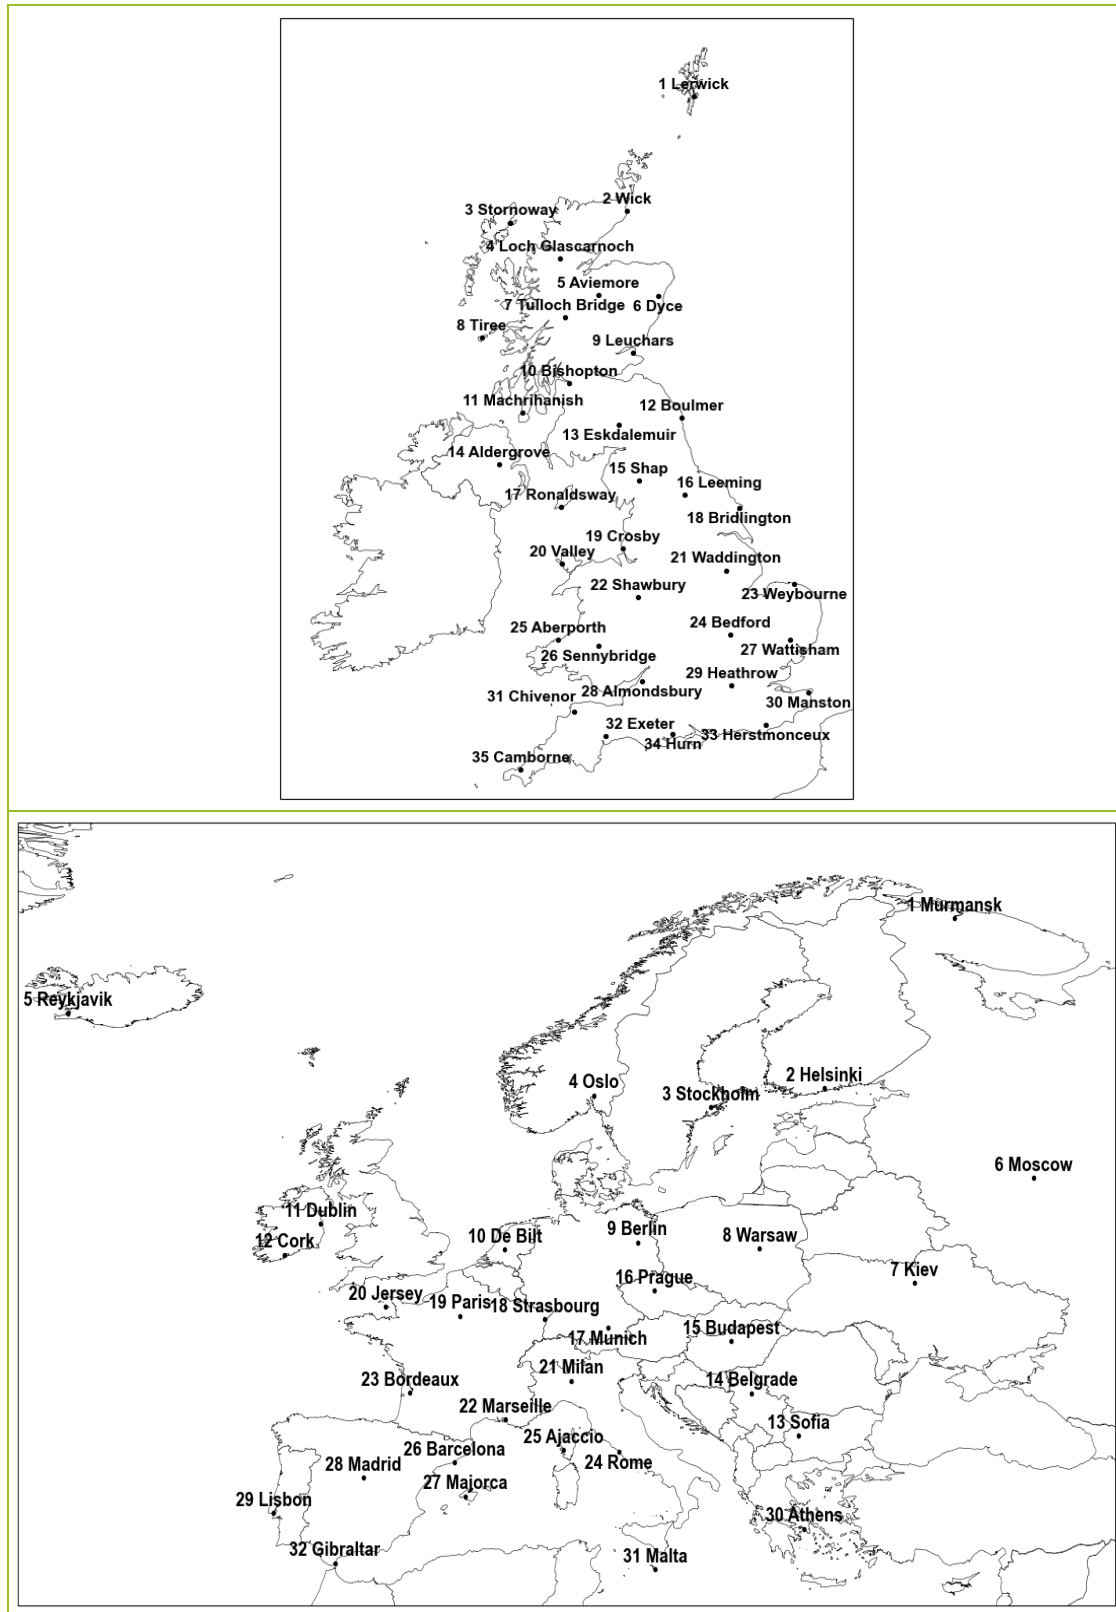

If you spot any data errors or omissions in this product please contact the Met Office.

Daily Weather Summary for Wednesday 01 November 2023

This day's summary created 08/11/2023 03:03

Summary of the UK Weather for Wednesday 01 November 2023

At midnight, a warm front sat across much of the UK bringing heavy persistent rain to Northern Ireland, much of the Midlands and southeast England. This moved northeastwards through the early hours and was followed by a cold front that brought more heavy rain to southwest England and Wales, again moving northeastwards through the early hours. Until around 0400, Scotland remained dry, as the band of rain arrived into southern Scotland. By dawn, much of the south of England was dry, although some scattered heavy showers still remained. The heaviest rainfall was seen in Northern Ireland, which was accompanied by some sferics. A band of rain pushed northwards through Scotland throughout the day, clearing the far north by midnight. Central England was clear to start but elsewhere there were scattered showers, some heavy and thundery in places. These scattered showers progressed northeastwards and weakened through the evening. Strong winds started to pick up through the evening as Storm Ciara approached from the southwest, tracking eastwards.

Summary of the UK Weather for Thursday 02 November 2023

Storm Ciara moved across the south of England bringing strong winds inland and coastal gales along with very heavy rain. Embedded thunderstorms progressed up the channel as the storm moved eastward. By the early hours, the flank of the storm with the strongest northwesterly winds hit Wales and the southwest. A band of rain also lingered over northern Scotland. Windy conditions affected most parts of England and Wales by morning. Winds were lighter throughout the night in Scotland and Northern Ireland. Strong winds and heavy, persistent rain affected southern parts of the UK during the morning as Storm Ciara moved into the southwest. The centre of the Storm shifted eastward over the course of the morning, shifting off the eastern coast of England during the afternoon. Central and northern parts of the England and Wales also saw showers and rain related to the storm, with the rain moving into Scotland as well later on after a cloudy but dry start. Northern Ireland remained dry through the day, with some sunny intervals. Although winds eased slightly in the southwest from their peak following the passage of the storm, they remained strong for much of the day in the south of England.

Summary of the UK Weather for Friday 03 November 2023

Storm Ciar n lingered to the east of the UK, leading to some frontal rain across the south east, some parts of eastern England and eastern Scotland. Elsewhere there were some light/moderate showers and it remained windy, particularly along the Channel. The rain and showers eased over the early hours, leaving England largely dry, though rain persisted over eastern Scotland. Former Storm Ciaran remained across the North Sea and slowly drifted northwards, whilst at the same time, pushed an occlusion back into eastern portions of Scotland as outbreaks of rain gradually pushed farther westwards during the afternoon. Elsewhere, sunny spells and scattered showers occurred, most of the showers affected western and southern regions exposed to a west to northwesterly airflow, some of these became heavy. A breezy day, with gusty conditions in coastal areas and near any shower activity. During the evening, showers continued across some northern, western and central areas. As winds continued to ease and as clear spells developed, especially in the south and east, patchy fog and frost occurred in places.

Summary of the UK Weather for Saturday 04 November 2023

Showers over northwest England and central Scotland moved eastward, easing through the early hours. Showers along the channel gradually shifted northeastwards. However, for most it was largely clear, barring some mist and fog patches. A warm front reached Cornwall just after midnight and pushed northeastward into southern England, south Wales and Northern Ireland, bringing some heavy rain and windy conditions, particularly to the southern coastline. During the morning, the band of rain moved. Northern Ireland and parts of Scotland also saw some showers. During the afternoon, the rain band weakened and fragmented slightly, moving into northern England. Showers continued in southern parts, spreading into south Wales and the Midlands. Much of northern England and central and southern Scotland was cloudy through the day, with fog in places but brighter in Northern Scotland. Winds were fresh or strong at first in southern parts of England and Wales, easing later. Temperatures were mildest in the south, but slightly below average under rainfall in central parts.

This day's summary created 12/11/2023 03:03

Summary of the UK Weather for Sunday 05 November 2023

Outbreaks of rain affected northern England and north Wales, with a few spreading into the Midlands, and parts of southwest England (along with showers in Cornwall and west Devon) in the early morning, while the south of England saw some heavy showers that quickly died out. Scotland and Northern Ireland also saw a few showers around the coasts, however were mostly dry inland with frost and patchy fog in places. Central and eastern England also saw some mist and fog overnight. Winds were mostly light or moderate, but stronger in the southwest. Showers affected Wales and Southwest England, and near-coastal areas of Northern Ireland and Scotland through the day while some outbreaks of rain slid down the east coast. Elsewhere, decent amounts of sunshine developed with the east and northeast of England and much of Scotland remained mostly dry. Some fair weather cloud bubbled up inland later on and some showers penetrated into the midlands and the southeast. It was breezy in the south, with light winds in Scotland. Temperatures were near average.

Summary of the UK Weather for Monday 06 November 2023

Showers, heavy at times, affected parts of Northern Ireland through the Irish Sea into north-west England, Wales and also through the English Channel, clipping southern counties of England. Elsewhere, it was mainly dry with clear spells, allowing mist and fog to develop in places, mainly in the north where it became chilly. Winds were light to moderate in most areas but particularly breezy along southern and western coasts. During the day, showers continued to affect western parts, some heavy, with a focus for some heavy and persistent showers over northwest England, along with parts of western Scotland. Some showers moved further east, into east and northeast England, and southeast Scotland. However, northeast Scotland, the east of Northern Ireland, the Midlands, southeast England, and East Anglia stayed mostly dry, with good sunny spells. Temperatures were near average with generally moderate westerly breeze, stronger near some coasts, but with light winds over Scotland.

This day's summary created 14/11/2023 03:03

Summary of the UK Weather for Tuesday 07 November 2023

Showers affected various western parts, these strongest across southwest England, northwest England, Northern Ireland and northern Scotland. These showers progressed mostly southeastward into the early hours, crossing much of Wales and the western coast of Scotland. Elsewhere it was largely dry and clear. Into the day time, showers continued to mostly affect western parts through the morning, while eastern areas were drier, and central and eastern parts of England were mostly sunny. Through the day, some fair weather cloud and a few showers formed further east, although generally isolated. During the afternoon, showers reduced in frequency in the west, and there were less showers than recent days, although parts of northwest England and southwest England continued to see relatively frequent showers. Many central and eastern areas saw a dry or mostly dry day with plenty of sunny spells. England and Wales saw a moderate westerly breeze, with lighter winds in Scotland. Temperatures were near average.

This day's summary created 15/11/2023 03:03

Summary of the UK Weather for Wednesday 08 November 2023

Overnight, a band of rain moved east, reaching much of the UK by dawn. This was mostly moderate although with a few heavier areas, especially west Scotland and western coasts. The rain eased from the west becoming more drizzly and fragmented, and clearer skies with showers followed into Northern Ireland by early morning. Winds became strong around western and southwestern coasts. Into the day time, the frontal system continued east, clearing eastern Scotland by early afternoon, although this lingered in the far southeast until the evening. Much of the UK then became dry, although with showers in western and central Scotland and Northern Ireland. Into the evening, rain lingered in the far southeast, and an occlusion brought a band of showers into Wales, northwest England and the far southwest. Winds were moderate throughout the day, blowing from the west.

Summary of the UK Weather for Thursday 09 November 2023

Showers over the UK this morning, heavier in the southwest, clearer towards the east. Average wind speeds were stronger to the west, especially Stornoway up to 19kt. Stratus cleared into convective cloud around 7am. Thursday was largely dry with bright spells across the UK, particularly in eastern areas. Some showers persisted over northern England and southern Scotland through the morning and western Wales also saw some rain moving in. During the afternoon, further rain associated with occlusions moving across much of Wales and northwest England. Winds were light over Scotland, but fresher in the southern half of England, with blustery conditions moving in with the rain across Wales in the afternoon. Temperatures were average for the time of year, but had a chillier feel in wet areas. During the first half of the night, western areas continued to see some heavy rain, but it stayed generally dry across the north, with some clear spells developing.

Summary of the UK Weather for Friday 10 November 2023

During the early hours of Friday, some troughs and an occlusion was passing by some parts of the UK. It has brought moderate amount of rainfall and showers during the night towards the southwest of England and most of Wales too. Some of which has crept into areas of midlands and Pennines. Far northern areas of Scotland has also experienced some showery rain. Winds were generally calm for most of the UK; while the southwest experienced stronger winds blowing easterly. An occlusion moved over southern England through the course of the morning, bringing heavy rain, and some thunder, to these regions but clearing into the channel by noon. The western coastlines of Wales and parts of Cornwall saw some showers through the day, while further showers moved into Northern Ireland and northern Scotland during the afternoon, the rainfall in Scotland turning heavy in places. However, the majority of the country remained dry with plenty of autumnal sunshine and light, northwesterly winds. It remained cool for the most part, with temperatures struggling to reach double figures even in the sunshine.

Summary of the UK Weather for Saturday 11 November 2023

It was mostly a dry and clear morning for most across the UK. A tail-end of an occlusion lingered just north northeast of Scotland, which brought some light showers to the region, especially the eastern side. A trough has also brought some slight weather in the form of light showers around the UK, most notably the eastern coast and the west. Winds were mostly mild, blowing southeasterly. A largely clear and chilly start for most, with scattered showers clipping some eastern parts. Some fog patches formed early on in central parts but these were quick to clear. It remained cold under the clear skies for most throughout the day. However, some hazier skies approached southwest England and Northern Ireland as a warm front approached, progressing northeastwards. The associated band of rain reached Cornwall by dusk and continued into south Wales and Northern Ireland by midnight, bringing milder air and blustery winds.

This day's summary created 19/11/2023 03:03

Summary of the UK Weather for Sunday 12 November 2023

An occlusion brought cloud and outbreaks of rain to south-west and southern parts of England and Wales, whilst further north across central and northern parts of England and Scotland, it remained mostly dry and cold with a widespread frost, and combined with light winds, allowed fog to form, freezing in places. Isolated showers affected North Sea coasts of north-east England and the far north of Scotland. Fog was slow to clear from many eastern parts of England. Meanwhile a band of rain across Northern Ireland, southwest England and Wales pushed northeastward. Clearer skies to the north were replaced by thickening cloud, becoming a widely dull and drizzly day across the country. Further patchy rain followed behind an occlusion, easing throughout the evening leaving clearer spells to the south and persistent rain to the north. It was a cloudy and mild evening overall, with the remainder of the rain focused over Scotland. Winds strengthened across the southwest and the Irish sea overnight, particularly around coasts with the approach of Storm Debi, which also brought heavy rain to the southwest.

This day's summary created 20/11/2023 03:03

Summary of the UK Weather for Monday 13 November 2023

Storm Debi tracked north-eastwards with the centre passing over Northern Ireland. An active warm front pushed a wide area of moderate, to locally heavy rain north-eastwards across much of England, Wales and Northern Ireland. Northern parts of Scotland remained mostly dry. Gales developed along the coasts of Northern Ireland, Wales and southern England in particular where severe gale force gusts were reported in places. During the day, Storm Debi continued eastwards, across southern Scotland, moving out of northern England. As the morning progressed, the wrap-around occlusion brought persistent heavy rain to parts of northwest England, and the heavy band of rain moved into eastern Scotland. To the south, fronts cleared quickly east with sunny spells and a few showers following, mostly over Wales. During the afternoon, rain gradually cleared Northern Ireland, while persistent rain continued in a band across northern England and also in eastern Scotland, easing slightly through the evening. Winds became very strong over some coastal parts of Northern Ireland at first, northwest Wales through morning and then northwest England through the middle of the day and afternoon, with severe gales around coasts and hills. To the north, winds were light for some under the low centre, but generally strong over the rest of England and Wales.

This day's summary created 21/11/2023 03:02

Summary of the UK Weather for Tuesday 14 November 2023

A series of occlusions swept across the UK overnight, Storm Debi having cleared to the east. These fronts moved across Northern Ireland, Wales, northwest England and Scotland. Some of the heaviest, most blustery showers were across northwest England and some were thundery across North Wales. These showers intensified into the early hours, more widespread as a particularly active band moved toward southwest England moving eastward. It remained windy across many coastal areas. Tuesday continued to be a fairly unsettled day, with low pressure being dominant. A series of occlusions lingered across many parts of the UK, causing outbreaks of showers for many, as well as bands of rain over northern England and Scotland. Broadly cloudy with some sunshine spells in southern parts. It was often breezy, with northwesterly moderate to fresh winds in the south at times and coastal gales over the English channel. Temperatures were close to average, warm in few places, but freezing conditions over the northwest.

Summary of the UK Weather for Wednesday 15 November 2023

Occlusions focussed over the north brought bursts of heavy showers to parts of Northern Ireland, southern Scotland and northern England, progressing southeastward throughout the night. Some lighter showers also affected Wales and western England, while a wider band persisted over northwest Scotland. Eastern England was largely dry and clear. Winds were predominantly west-southwesterly and it was breezy across coastal areas. Low pressure continued to dominate through Wednesday. A couple of occlusions lingered over southern parts of Scotland and northern England, this causing a band of rain which affected such areas, as well as Northern Ireland. It was persistently cloudy in the north, however the south was fairly dry with plenty of sunshine spells. The band of showery rain weakened into the evening and many areas were dry, although rain reached the far southwest by late evening. Moderate to fresh westerly winds were recorded through the day, this accompanied by close to slightly below average temperatures, with evening frost in northern Scotland.

This day's summary created 23/11/2023 09:03

Summary of the UK Weather for Thursday 16 November 2023

Through the early hours, a band of rain moved eastwards across southwest England, associated with a low pressure system moving into the English Channel. This rain became heavy for a time and by the end of the night it was moving into much of southern England with some light rain in south Wales. Elsewhere, it was mostly dry with the odd fog patch. Northern Scotland was clear with a significant frost and patchy fog. Temperatures were near average further south, and slightly milder than average in the southwest where the wind picked up from the east with the rain. During the day, a low pressure system hovered above the southwest travelling eastwards in the morning. This has brought substantial amount of rainfall and shower to the southern and southwestern region of the UK. An occlusion also lingered above the eastern coast straddling across to Scotland which has also brought some showery conditions to the area. Later in the afternoon, a cold front has arrived to the western coast of the UK, this has brought some rainfall to the western coast of the country. Throughout the day, winds were calm.

Summary of the UK Weather for Friday 17 November 2023

The start of Friday was mainly dominated by low pressure to the northwest of the UK, however high pressure became more influential across the south. A band of rain affected western parts of northern England and Scotland, and there were also showers across the south and the far northeast. Summary of the UK Weather for Saturday 18 November 2023

The start of Friday was mainly dominated by low pressure to the northwest of the UK, however high pressure became more influential across the south. A band of rain affected western parts of northern England and Scotland, and there were also showers across the south and the far northeast. Precipitation and cloud cleared to the east by the morning, leaving a fairly dry theme with sunny spells, especially for southern areas. Temperatures were mostly below average, with freezing conditions over northeastern parts of Scotland. A largely dry day for most of the UK with some brighter spells and some isolated showers in north Devon and north Wales. However, a rain band began to move into the southwest around midday, bringing heavy rain to the southwest and Wales in the evening as the band moved into central UK. Showers at times heavy over northern England, Scotland and Northern Ireland. Patchy fog in prone areas in primarily western Scotland. Parts of northern Wales strong gusty winds over upland areas through the first half of the night. Clearer skies in the south.

Summary of the UK Weather for Sunday 19 November 2023

From midnight, heavy rain in Scotland and Wales and some showers in Northern Ireland. Spells of rain moved south into northern England and west across the UK but still focused across western upslope areas. Heavier rain approached Northern Ireland around 5am and the coasts of Wales by 7am. Drier in east and southern England with some clearer spells throughout the early morning. Strong winds around western coastal areas. Temperatures stayed consistent overnight into the early morning across the UK in mostly double digits, cooler in the north of Scotland. It was a widely cloudy day, though with occasional sunny spells in southern parts. Heavy rain progressed eastwards across north Wales and northwest England, crossing eastern England in the afternoon and became lighter and more scattered into the evening. Elsewhere there were some light showers, particularly across the Channel and Scotland. It was windy particularly across the Wales and the southwest and was particularly strong in Shetland. Another heavy band of rain began to approach south Wales by midnight, and there were stronger outbreaks across Scotland in the late evening. Overall temperatures were mild under cloudy conditions.

Summary of the UK Weather for Monday 20 November 2023

Monday started off to a wet windy start for some. Several occluded fronts hovering above the UK has brought plenty of rainfall over the early morning hours. Plenty of wet and rainy showery conditions was brought to the southwest of UK, also northern England and parts of Scotland. Some isolated showers also occurred over the evening for central areas. The winds were blustery. A heavy burst of showers associated with an occlusion cleared across the southeast through the morning. There were some lighter showers across parts of Wales, the southwest and the north, but these were isolated. Elsewhere it was largely dry, especially across central and eastern England, where there was mostly sunshine. Remaining blustery, especially around showers and coastal areas. Into the evening, cloud thickened in the south but skies cleared in the far north of Scotland. A relatively mild day but temperatures dropping into the evening in the far north of Scotland, under the clearer skies.

Summary of the UK Weather for Tuesday 21 November 2023

Rain and showery conditions continued, following on from Monday evening. These wet conditions eased off through the night into the early hours of the day. The heaviest showers were around northeastern England coastal areas. Some showers also lingered around the coastal areas in the southwest of England and there were a few isolated showers elsewhere around the country. Winds were light, blowing southerly. Tuesday was a fairly dry day, dominated primarily by high pressure to the southwest of the UK. The south saw showers in the southeast due to the passage of an occlusion, however it was dry with sunny spells for most southern parts. In contrast, the north saw a cloudier picture with outbreaks of rain which affected northwest Scotland from the afternoon and into the evening. Light to moderate northerly winds were predominant through the day. Temperatures remained close to or slightly below average, with frost and fog patches developing in places over northern areas.

Summary of the UK Weather for Wednesday 22 November 2023

A series of fronts made their way southeastwards through the early hours, bringing rain and drizzle mainly to northern England and western Scotland, the heaviest of which was over orography to the northwest of Scotland. It remained mostly dry to the south, and cloud built up overnight as the fronts made their passage. Winds were strong to the north, particularly southwesterlies around Scottish coasts. Temperatures were around average. Wednesday weather set was a north-south split, mainly governed by high pressure across southern England. Cloudy for most of the UK, with the wettest conditions over Scotland, north England and Northern Ireland, fairly dry everywhere else. Mild temperatures for most initially, but turning colder from the north throughout the afternoon. Westerly fresh winds, turning strong in places, where predominant through the day.

Summary of the UK Weather for Thursday 23 November 2023

There were rain and showers across northwest Scotland overnight, associated with a cold front, making its way south through the early hours. This was associated with some strong winds extending inland down to Yorkshire and some severe gales across exposed coasts and Shetland. Elsewhere it was a widely clear night, some patchy cloud and drizzle in spots. A mild night across the country, warmest to the north and coolest to the south. Showers in the north and Northern Ireland moved south throughout the day bringing cooler air and clearer skies. By midday showers moved into the midlands and some small showers in the far southwest. Rain showers mostly clear up and some sunny spells in the afternoon in the southern half of the UK. Wintery showers in the northeast this evening and strong winds in the north and eastern coasts.

This day's summary created 01/12/2023 03:03

Summary of the UK Weather for Friday 24 November 2023

Friday was primarily dominated by high pressure to the southwest of the UK. This, combined with a low pressure centre to the north of Scandinavia, created a synoptic set up that pushed northerly moderate to strong winds across the UK. Fairly dry for most, excluding northern areas and the eastern coastline which saw scattered showers. Cloudy with some clear spells over the southeast and central parts of England. Temperatures were close to above average for the time of the year, however freezing conditions over Scotland. A few showers this morning focused on the north, northwestern, eastern coasts and some central. This remained throughout the day but eased in the late afternoon and cleared away in the evening. Most clear skies inland, some sunny spells throughout the day along coastal areas, the north and Ireland. Clearer skies in the late afternoon. Cloud approached the far west by midnight.

Summary of the UK Weather for Sunday 26 November 2023

Little rain early this morning, some in the far southwest and Ireland, moving east throughout the day. A thick band of cloud moved into central UK this morning. Some freezing temperatures across inland UK overnight. Mostly cloudy skies affected much of the UK today as patchy outbreaks of rain and drizzle drifted across Northern Ireland and eastwards over much of Wales, southern and south-western portions of England. A few brighter spells affected parts of Scotland and more eastern parts of England. Throughout the evening, it remained cloudy with outbreaks of rain transferring eastwards with time, some moderate spells of rain affected southern counties of England whilst outbreaks of rain affected southern Scotland. Clear spells across central and northern parts of Scotland led to a frost here with isolated showers, wintry across higher ground.

Summary of the UK Weather for Monday 27 November 2023

A band of rain moved southwards gradually this morning, heavy over Wales then the southwest, and had moved into the east by 6am. There were a few showers over Scotland and Ireland this morning, but mostly no rain and a few sunny spells. Generally light winds through the night, though becoming breezy around coastal areas, and particularly strong and gusty over the Northern Isles. A fairly mild morning across the UK. The day started with showers clipping coastal parts of eastern Scotland, England and the southwest. Additionally a band of rain and drizzle over northern England moved southwards throughout the day, clearing Kent in the late afternoon, bringing heavy rain and poor conditions in some spots, especially eastern England. As this band of rain moved away, showers replaced it, pushing further inland across eastern parts of the UK. The west became widely dry and clear, but it was a cloudy day for most. Though the evening, showers eased for central and western areas, but continued for the east, feeding in off the North Sea.

Summary of the UK Weather for Tuesday 28 November 2023

Showers affected northern Scotland, wintry across higher ground whilst showers also affected windward coasts. It remained cold, particularly across parts of northern England and Scotland with a number of air frosts reported. Some early morning fog affected parts of central England, but cleared to leave a fine, cold day for most. Although inland was largely clear and dry, showers continued to impact northeastern parts of the country, particularly northeast Scotland, occasionally in the form of snow at elevation, with windy conditions across eastern coasts. Other showers associated with convergence lines located in a north-south orientation along the Irish Sea and northeast-southwest off the coast of Kent brought some heavy bursts, clipping coastal areas at times early on but shifting further southeast and dissipating throughout the day. Temperatures dropped into the evening under largely clear skies, and showers continued to affect eastern parts, though cloudier conditions lingered in the southwest, keeping temperatures milder.

Summary of the UK Weather for Wednesday 29 November 2023

Showers, some of these containing a wintry mix of rain, sleet and snow, continued to affect northern and northeastern parts of Scotland as well as North Sea coastal districts of Scotland and England, in association with a trough and an area of low pressure moving over the southern North Sea into the Low Countries. Cloudier skies affected parts of Wales, southern and southwestern parts of England with scattered showers here. Elsewhere, clear spells led to a widespread, locally sharp frost with freezing fog reported in one or two locations. Wednesday was a fairly dry day, with some showers across Scotland and the northeastern coastline. The southwest was affected by a band of rain in the afternoon and into the evening. Temperatures were cold, with frosty conditions developing in many places, the best of any mild weather confined to the far south. Fairly cloudy with sunny spells in western and southern parts of the country, where cloud tended to break up. Northeasterly light winds were predominant through the day, with low pressure being dominant over the UK, this causing cold air to spread across most regions from the north. The night was cold and frosty, accompanied with freezing fog and snow over northern uplands, primarily.

This day's summary created 07/12/2023 03:03

Summary of the UK Weather for Thursday 30 November 2023

It was cold and largely clear into the early hours of Thursday. Wintry showers continued to clip eastern coasts and northwest Scotland, coming further inland at times and bringing light precipitation in the form of sleet and occasionally snow. An occluded front slowly moved a band of rain towards the far southwest and south of England, some of this falling as snow. By dawn there were odd freezing fog patches and the rain to the southwest increased in intensity. Freezing fog patches lingered through the morning, struggling to clear particularly around Wales and southern England. The day remained very similar to the overnight period, with showers continuing around coastal parts of northwest Scotland the eastern edge of the UK. The occluded front stalled over southern parts, bringing rain, sleet and some snow to the far south of England, the heaviest of this over Cornwall to begin with. This was accompanied by some strong winds across parts of the southwest. The precipitation and wind eased by nightfall and the occlusion began to recede southwards, away from the coast, clearing by midnight. Elsewhere it was clear and dry, and it remained cold throughout the day, some places struggling to rise above freezing.

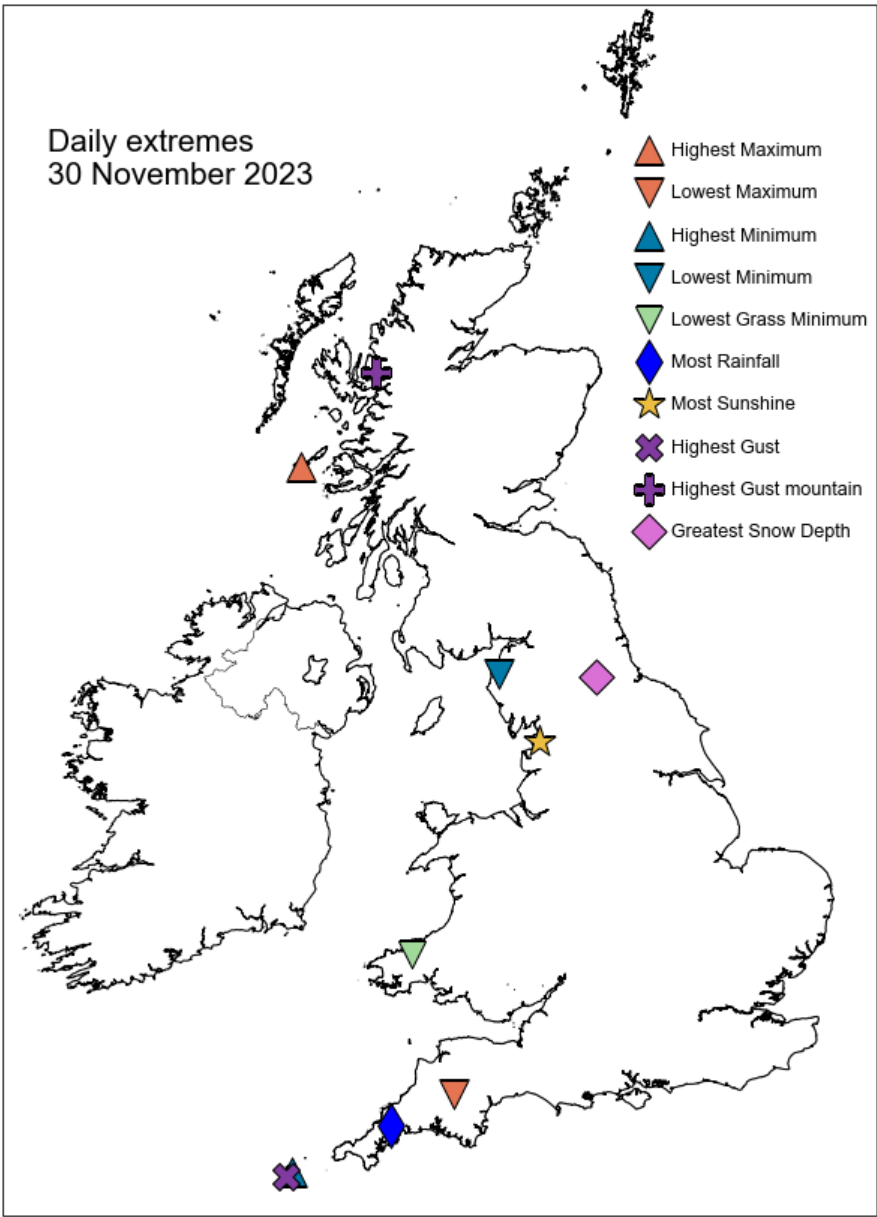

Daily Extremes

<i>Highest Maximum</i>	7.6°C Tiree (Argyll (in Strathclyde Region), 9mAMSL)

Daily Weather Summary for Thursday 30 November 2023

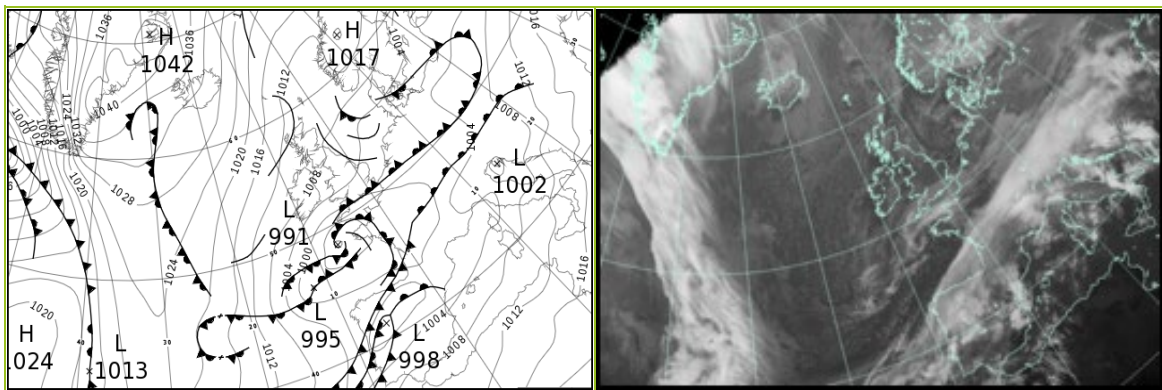

Daily Weather Summary for Thursday 30 November 2023

Guidance Notes

UTC = Universal Coordinated Time. For the UK UTC is the same as GMT (Greenwich Mean Time).

National boundaries shown on the European station map are for illustrative purposes only.

Daily extremes

- Daily extremes have been manually confirmed by Met Office Observations Quality Management as valid observations from the live database at the time of checking. However, more extreme values may still be possible if they occur after the time of production.
- Mountain stations above 500 masl are excluded from lowest temperatures, highest gust speeds and greatest snow depths at 0900 UTC. This is because they are not considered representative of low level areas.
- Counties quoted against each station are based on historical county boundaries pre-1974 and may not reflect current administrative boundaries.

Analysis charts and satellite imagery

- The satellite imagery is infra-red imagery from the geostationary MSG satellite.
- The rainfall image is derived from satellite data from MSG and rain-radar data. This represents a snapshot of instantaneous rain-rates at 0000 UTC and 1200 UTC and so does not necessarily reflect daily accumulations in the rainfall station map.
- Any analysis charts or satellite images which are unavailable will be displayed as white space.

Station maps

- The UK maps show station data for the same set of stations presented UK data table. These stations are selected to provide good spatial coverage across the UK; they represent only a fraction of the overall UK observing network.
- Wind speed maps show wind speed in Kt and direction both averaged over the hour up to the time of observation. 1 Kt = 1.151 mph.

Hourly station data

- The data tables provide spot hourly observations from synoptic messages at 0000 and 1200 UTC. Missing data are denoted by '-'.
- Pressures are mean sea level pressure in hPa.

- For UK stations, Gibraltar and Jersey, the wind speeds and directions are both averaged over the hour up to the time of observation. However, for European stations wind speeds and directions are both averaged over a 10-minute period up to the time of observation.
- Wind speeds are in Kt. Wind directions are stored in the database every 10 degrees and have been converted to the nearest point of the compass. These give the direction the wind is blowing from, not to.
- Cloud amounts are in Oktas from 0 (clear) to 8 (overcast). 9 indicates sky obscured (eg by fog).
- Air temperature and dew point temperature are in Celsius.

Temperature maps

- Daily maximum, minimum and grass minimum temperatures are in Celsius.
- The period for the daily maximum temperature is defined from 0900 UTC on the day in question to 0900 UTC the following day.
- The period for the daily minimum and grass minimum temperatures is defined as 0900 UTC the previous day to 0900 UTC on the day in question.
- On any given day the minimum will typically occur in the early hours of the morning and the maximum in early afternoon.

Rainfall, sunshine and max gust speed maps

- Daily rainfall is in mm from 0900 UTC on the day in question to 0900 UTC the following day.
- Daily sunshine is in hours from Kipp and Zonen CSD1 automatic sunshine records. Bright sunshine is defined as exceeding 120 W/m².
- Max gust speeds are the daily max gust in Kt from 0000-0000 UTC

Snow maps

- The day of snow falling map displays data from present weather sensors, showing stations which have recorded sleet or snow falling at any point in the day (0000-0000 UTC).
- The snow lying map shows level snow depth as recorded by the automatic snow depth sensors at 0900 UTC. These snow depth sensors do not record snow depth if this is less than 1cm.
- Snow depth sensors are normally operational from October to April, in the event of snow falling outside this period data availability may be limited.
- Snow maps will only be displayed if one or more of the selected stations on that date have recorded either snow falling or non-zero snow depths. If snow maps are not

displayed it is still possible that other stations in the network have recorded a day of sleet or snow falling or non-zero snow depth.
