## Daily Weather Summaries for September 2017

**If you have any questions or feedback about this product or wish to obtain further data please contact the Met Office.**

This document contains daily weather summaries for each day of September 2017. The Met Office National Meteorological Library and Archive holds a continuous record of daily weather summaries or daily weather reports from 1860, and these daily weather summaries form a continuation of that series.

The purpose of each summary is to provide an overview of the weather conditions across the UK on that day, with the historical emphasis mainly based on observations from surface network of weather stations, although the format has varied over the decades. While the emphasis remains on observations from the surface network, the current daily weather summaries supplement these by including satellite and rain-radar imagery to provide a more complete overview. The current format of the daily weather summaries is as follows:

1. Text summary of the main characteristics of the weather during the day, written by an operational meteorologist in the Met Office operations centre.
2. Table of daily extremes for the UK for key climate variables including temperature, rainfall, sunshine and gust speeds.
3. Overview of the synoptic situation at 00 and 12 UTC comprising: analysis charts showing the surface pressure pattern and associated weather fronts; North Atlantic and European infra-red satellite images showing cloud-cover; combined infra-red and rain-radar images of the UK; maps of wind speed and direction at 00 and 12 UTC; observations of pressure, wind speed and direction, cloud cover, air and dewpoint temperature at selected UK and European stations in data tables.
4. UK maps of key climate variables from observing stations including maximum, minimum and grass minimum temperature, rainfall, sunshine, gust speed and snow.
5. Further guidance notes

If you spot any data errors or omissions in this product please contact the Met Office.

## Daily Weather Summary for Friday 01 September 2017

This day's summary created 25/10/2017 12:52

### Summary of the UK Weather for Friday 01 September 2017

Showers continued to ease away during the night, but a few lingered along the south coast, affecting places like Weymouth. There were also a few showers across Scotland. Many places saw a clear and cool night with temperatures widely in mid-single figures even in parts of the south. A few mist and fog patches formed by dawn too. Through the day many saw sunny spells, and in the sunshine it felt warm with temperatures slightly above average for the time of year. However, isolated convergence showers formed along the east coast of England, gradually drifting inland during the afternoon. One or two of these showers turned heavy and thundery. Otherwise, there were light winds across the UK throughout the day. Through the evening, showers in the east gradually faded away so all of the UK turned dry with some late sunshine. It quickly turned chilly after dark leading to a rather cold start to the night. Winds remained light leading to a few isolated mist or fog patches in places.

### Summary of the UK Weather for Saturday 02 September 2017

During the early hours of Saturday, any lingering showers tended to ease and clear away into the southern North Sea, with one or two showers clipping the east of Norfolk and Suffolk. Otherwise skies were largely clear across the UK and some mist and fog formed in a few areas. It was a chilly night with temperatures falling close to freezing across the Scottish glens. For many areas it was a fine morning on Saturday. Fog patches did persist in places though, mainly area Yorkshire, Lincolnshire and towards East Anglia. Through the afternoon showers affected parts of East Anglia with some of these fairly heavy in places. Elsewhere there was some warm sunshine, although with more cloud than during the morning. Through the day, cloud thickened across much of South West England, Wales and Northern Ireland, and it turned wet across parts of the Province by the evening.

Rain tracked eastwards through the evening, bringing heavy rain across Northern Ireland, and the far west of England and Wales by midnight. To the east it was dry, clear and rather cool.

### Summary of the UK Weather for Monday 04 September 2017

It was a misty and foggy start across the UK through the early hours, with extensive low cloud and outbreaks of rain and drizzle. This kept temperatures milder than average for the time of year, with humid conditions under all the low cloud.

During the day time it stayed rather cloudy across most of the UK. There were a few breaks in the cloud in the Midlands but not many. It was warm and muggy in many places, with temperatures higher than average for the time of year. A band of rain worked its way down from western Scotland into northern England, including some heavy bursts over the mountains. Behind it, brighter and fresher weather moved into northern Scotland.

This day's summary created 25/10/2017 12:52

### Summary of the UK Weather for Tuesday 05 September 2017

Through the early hours, a band of heavy and persistent rain moved across parts of northern England, southern Scotland, Northern Ireland and Wales. Elsewhere across the southeast it remained humid, whereas to the northwest of the UK, fresher air started to move in. Heavy rain fell across north Wales and parts of northwest England through the morning, before pushing eastwards across the UK.

The rain weakened as it moved across the UK, but continued to give some occasional heavy bursts into the evening too. Behind, it turned fresher and clearer with sunny spells following for Wales, southwest England, Scotland and northern Ireland. However there were also a few showers across parts of Scotland and Northern Ireland too. Temperatures were around average for the time of year in the southeast, but slightly cooler than average elsewhere.

### Summary of the UK Weather for Wednesday 06 September 2017

The weather was mostly settled through the early hours of the morning, with much of the UK seeing dry conditions and clear spells. There were a few scattered showers around though, with the odd one or two heavy bursts.

Aside from a few showers across the northwest of Scotland, northern Ireland and parts of northern England, Wednesday was a fine day with sunny spells. It was breezy for many too, especially around western facing coasts and hills with a westerly wind. This also made for a fresher day for all.

This day's summary created 25/10/2017 12:52

### Summary of the UK Weather for Thursday 07 September 2017

Overnight, many saw rather cloudy skies, accompanied by occasional showers, mostly confined to the south and west. Some showers turned heavy and thundery in the west. Meanwhile, thicker cloud and rain began to spread across western Scotland towards dawn. Temperatures were on the mild side. Thursday daytime started with the clear skies in the southeast and a frontal band of rain and cloud across Northern Ireland and western Scotland. A few showers filtered into Wales and Devon/Cornwall. Frontal rain and cloud continued to push north-eastwards across N. I. and Scotland and into the North Sea. Across the southeast cloud cover gradually increased but it stayed dry by and large apart from the odd isolated light shower. Showers started to become more frequent in the west/southwest by early evening, with moderate showers and cloud moving across the north.

### Summary of the UK Weather for Friday 08 September 2017

Showers continued to affect Wales, western England and northern and western Scotland throughout the early hours. In the east it stayed drier, although even here there were a few showers too. Under some clearer skies, it turned chilly but it remained windy along the southern and western coasts. Through the day a band of rain pushed across southern England and then became parallel to the English Channel, giving some heavy rain along the south coast and over the Channel Islands. Showers followed on behind, turning torrential and thundery for some as they spread eastwards, particularly across the Midlands and East Anglia. In between there was some sunshine, the best of this across northern England. It was a rather windy day across the UK, particularly around western and southern coasts with some gusty winds in and around showers too. Temperatures were close to average for many, but it felt cooler under the cloud, rain and wind.

### Summary of the UK Weather for Saturday 09 September 2017

Showers continued for some through the early hours, with some heavy ones across southwest England, Northern Ireland and northwest England. Elsewhere, showers were fewer and further between and across parts of southeast England there were clearer skies. Where skies were clear it turned rather chilly, particularly in the east as winds were also lighter here. However, the winds remained brisk around western and some southern coasts, helping to keep the temperatures from falling. Saturday day, then saw a mixture of sunshine and showers, mainly in the west at first before becoming more widespread across many parts of the UK. The showers turned thundery across the Midlands, the Home Counties and East Anglia through the afternoon and these became slow moving as winds were light. In contrast, the showers moved through quickly in the west on a strong wind, although for many the winds eased into the evening. Temperatures were close to normal for early September across most parts, but with the sunshine and showers it felt quite autumnal for many.

This day's summary created 25/10/2017 12:52

### Summary of the UK Weather for Sunday 10 September 2017

For most, showers faded through the night to leave many places dry with clear spells during the early hours, particularly in Northeast England and East Anglia, where mist and fog formed in the period before dawn. A few showers continued around western coastal fringes, primarily southwest England and western Wales at first, but mostly across Northern Ireland and western Scotland. The cloud thickened in the west with more persistent rain reaching the Western Isles towards dawn. Minimum temperatures were around average for the time of year, although perhaps a little lower in the east under the clearer skies. Through the daytime, the persistent rain and drizzle cleared to leave sunshine and blustery showers through the day. The general southwesterly wind began to strengthen through Sunday afternoon with a moderate to fresh southwesterly breeze for most during the late afternoon/evening with coastal gales in the far southwest. Showers continued to push across the UK from the west on Sunday night, some of which produced thunder and lightning over NW England and Wales.

### Summary of the UK Weather for Monday 11 September 2017

There were outbreaks of rain and showers across the northwest overnight. Occasional showers also persisted across the southwest. It was drier with clear spells across the southeast, although a few showers did make their way from the west into the North Sea. Winds were generally moderate for inland areas, but the south and southwest coasts saw gales through the early hours. Sevenstones lightship reported gusts of 53KT, Aberdaron 54KT and Mumbles Head 51KT. There were also gale force gusts around the coast of the Bristol Channel and western Wales. The clearest skies were across the southeast, and parts of Scotland where the lowest temperatures were recorded.

There continued to be plenty of blustery showers across the UK through the day, some were heavy at times with hail and thunder, especially across eastern parts. It continued to be windy with gale force gusts across western parts of the UK in particular, though not as strong as what was experienced overnight. Into the evening, the showers slowly became more confined to western areas. It was a cool feeling day for many.

### Summary of the UK Weather for Tuesday 12 September 2017

Showers eased across most parts of the UK overnight, although some persisted across western areas, especially in Cheshire and the coast of northwest England and Wales, where they were heavy at times. There were lighter showers which also persisted along the northern coasts of southwest England. There was a moderate to fresh northwesterly breeze across many areas, but winds were a little lighter across the south and southeast and also Northern Ireland. It was a fairly cool night. Many central and eastern parts saw a largely dry and bright start with plenty of sunshine. Meanwhile, western parts saw more in the way of unsettled weather, with scattered showers, some heavy. Through the rest of the day the showers crept eastwards, whilst cloud and rain spread (Storm Aileen) across western parts later on.

### Summary of the UK Weather for Wednesday 13 September 2017

Wednesday saw a windy start with the remnants of Storm Aileen continuing to clear eastern parts. Here, there were gales and severe gales at first, though the winds gradually eased through the day.

Elsewhere, Wednesday was a day of sunshine and scattered showers, with some showers turning heavy at times with occasional thunder and lightning too. Meanwhile, an occlusion brought showery rain to Scotland at first, though this wet weather gradually sank southwards into northern England as the day progressed. It was a breezy day for most.

### Summary of the UK Weather for Thursday 14 September 2017

Through the early hours of the day there were clear skies for many, which led to a chilly start to the day. There were frequent sporadic showers in the west, and a band of showers affecting Wales and Merseyside. Some persistent rain also fell in Yorkshire spreading southwards into Lincolnshire. Into the day times there were sunny spells and scattered showers, with some turning heavy and thundery in places. However, some of the showers merged into longer spells of rain across parts of Scotland, with this area of rain slowly sinking southwards through the rest of the day. It was a breezy day overall, especially in the far north and east, and temperatures were cooler than average for the time of year.

### Summary of the UK Weather for Friday 15 September 2017

A band of showers moved southwards through the early hours of the morning, giving heavy rain across southwest England, Wales, and northern England. Elsewhere there were clear spells and the odd shower at times.

It was a chilly start at dawn, with showers scattered across Wales and parts of northeast Scotland and northeast England, but elsewhere it was dry and bright. By the afternoon, patchy cloud started to bubble up around the UK, with some producing showers across England. Northwest Scotland stayed relatively shower-free during Friday, but the showers across the rest of the UK were heavy and thundery at times, particularly in the south and east of England during the afternoon. There was a moderate to fresh northerly wind across coastal parts of northern Scotland and northeast England with near-gale force winds over the summits of the Highland mountains. Elsewhere, winds were light to moderate, and temperatures were a little cooler than average for the time of year.

### Summary of the UK Weather for Saturday 16 September 2017

There were a few heavy showers across southwest England, Wales and northern England through the early hours, with cloudier skies and some more persistent rain across northern Scotland. Elsewhere, skies were clear and with lighter winds it turned chilly with some patches of mist and fog, mainly across England and Wales. In the glens of Scotland there was a touch of grass frost as temperatures fell close to freezing. By dawn a frontal system started spreading in across northwest Scotland bringing outbreaks of light rain. This gradually spread southwards into Northern Ireland giving a cool and wet day here, before moving through the Irish Sea, with thicker cloud extending across Wales and parts of southwest England. Elsewhere, showers broke out again and these were heavy and thundery across southern parts of England and Wales. Across northern England there were fewer showers, and later it turned drier and sunnier across northern Scotland. For most winds were lighter than recent days, except for in the far southwest of England. After the chilly start, temperatures remained cooler than average for most and it was notably cold in showers.

### Summary of the UK Weather for Sunday 17 September 2017

Through the early hours, showers became confined to southwest England and parts of south Wales. A few showers also filtered in from the North Sea, across eastern Scotland and eastern England, but it was a quieter night elsewhere with clear skies. A lot of fog developed over much of East Anglia and eastern England, with pockets elsewhere too. It was a cold night for many - especially across Scotland.

Fog lifted into mist and low cloud and gradually cleared from East Anglia, Lincolnshire and the Vale of York through the morning. A few showers continued to feed southwestwards into Northeast England but it was drier and brighter elsewhere. By the afternoon showers developed across other parts of eastern England and became heavy and thundery in places. It remained mostly dry across the southwest, Northern Ireland and Central and Western Scotland with spells of sunshine, and it felt pleasantly warm in fairly light winds.

Through the evening, showers continued across many central and eastern parts but it remained drier further west and once again it turned chilly after dark.

### Summary of the UK Weather for Monday 18 September 2017

A few showers, some heavy at times, affected East Anglia overnight. Extensive low cloud and hill fog developed across eastern and southeastern areas and made for a rather mild night here. Further west, however, it was largely dry with clear spells and the odd patch mist and radiation fog. Under these clear skies, it was a chilly night, across western parts. In the morning mist and fog soon cleared away to leave fairly cloudy skies across England and Wales. Showers then developed across England and Wales that were heavy at times. By contrast, Scotland and Northern Ireland stayed dry with sunny spells. By the evening on Monday a more organised area of rain started to move southwards through southern Scotland and Northern England and continued to make southward progress into Tuesday. Winds were fairly light away from the North Sea coast.

### Summary of the UK Weather for Tuesday 19 September 2017

An area of rain slowly tracked across the southeast at the start of the night. This cleared away in the early hours to give a largely dry night across the UK with clear spells. Under the clear skies, it became chilly for many places, with widespread mist and fog patches across England and Wales. Dense fog patches took some time to clear on Tuesday morning, with some of them lingering for much of the morning in central parts of England. However, for most it was a fine day with some sunny spells and light winds. It was largely dry too, apart from one or two showers in East Anglia during the afternoon. Later in the afternoon it turned rather cloudy in Northern Ireland with one or two outbreaks of light and patchy rain, which spread into western parts of Scotland through the evening.

### Summary of the UK Weather for Wednesday 20 September 2017

England and Wales stayed largely dry overnight with some clear spells. It was a chilly night where the skies cleared. Some mist and fog patches also formed in light winds. Cloud thickened across Scotland, Northern Ireland, and parts of northern England with some light rain here at first. However, the rain turned heavier in the far northwest towards dawn.

Heavy rain continued to affect Northern Ireland throughout the day along with Scotland and some parts of Northern England, with that rain pushing slowly eastwards through the day. Rain also arrived in parts of southwest England and Wales where there was extensive hill fog. It was a windy day in the west in particular. Further east across north east England, central England and the southeast of England, it was a dry day with some sunshine and light winds.

### Summary of the UK Weather for Thursday 21 September 2017

Much of the UK had a rather damp night with lots of low cloud giving extensive hill fog. However, as a result of the cloudy skies, it was much milder than recent nights. The main rain band moved from Northern Ireland into Wales, and the west of England by the end of the night. Some of this rain was rather heavy and the rain band was accompanied by stronger winds. During the day the cloud and rain continued to spread eastwards, bringing a wet and rather grey day to many parts of England in particular along with north and east Scotland. Further west it was drier and brighter, with some reasonable sunshine emerging once the rain had cleared through. However, there were some showers in the southwest, Wales and western Scotland. By the end of the day the rain band was confined to the far east of the UK, with clearer skies elsewhere.

### Summary of the UK Weather for Friday 22 September 2017

A band of rain cleared away to the east during the early hours of Friday morning, leaving a largely dry, and clear night across the UK. There were even a few patches of grass frost across Scotland. The low temperatures and damp surfaces allowed many fog patches to form, principally in central and eastern parts of England and Scotland. Across the west it became windy at the end of the night with a few outbreaks of rain moving into the far west of Northern Ireland. During the rest of the day, the band of rain in the west continued to make slow progress across the UK. By the early evening it was broadly covering The West Country, Wales, Northern England and much of Scotland. The South East of England remained clear and dry with some warm sunshine but it was chilly in the north and west under the cloud and rain. Winds were broadly southerly ahead of the front with westerly wind following on behind.

### Summary of the UK Weather for Saturday 23 September 2017

In the small hours of Saturday morning an old, weak, front cleared eastwards into the North Sea and a new front arrived in the far west and northwest of the UK. The old front gave a little light and drizzle across the southeastern counties of England, whilst the front arriving in the far west brought some patchy rain. With abundant cloud cover and a southerly flow it was a mild night across the UK with many urban areas remaining in double figures. A moderate southerly breeze developed across western parts, with light winds elsewhere. During the morning clear skies across Cornwall and Devon developed northward and eastward, reaching South Wales and Hampshire by midday. The cloud across Northern England gradually moved into Southern Scotland, although, by the late afternoon the cloud had become rather variable, but with the best of the sunny spells for eastern and southeastern parts of the UK. The front in the west made slow progress eastwards bringing another cloudy night across the UK with a few spots of rain for western parts where it remained breezy.

### Summary of the UK Weather for Sunday 24 September 2017

Through the early hours of Sunday, thickening cloud brought rain into many western parts of the UK, and it turned breezy in the northwest. Meanwhile, central and eastern parts of Wales, easternmost parts of Scotland, and most parts of England, bar the extreme west remained dry with some clear spells. It was another mild night everywhere, and temperatures held up in double figures for many.

Many central and eastern parts of England had a fine start to the day with plenty of sunshine. There was more cloud in the west, with patchy rain across N Ireland, W Scotland, W Wales and SW England. Through the day, this rain slowly moved eastwards and turned heavier in many areas, especially across Scotland and NW England. Ahead of the rain, it stayed dry across the east, but the sunshine turned hazier as cloud thickened through the afternoon. To the west of the rainband, it was a fine end to the day across much of Northern Ireland with only scattered showers. It was a warm day in the sunshine, and most places saw around average temperatures.

### Summary of the UK Weather for Monday 25 September 2017

Many places in Britain were cloudy overnight, with extensive drizzle, low cloud and hill fog. Some heavier rain fell across parts of the Midlands. Northern Ireland was under clearer skies which allowed for a chilly night and locally dense fog to form by dawn.

Through the day the rain and drizzle, tended to fizzle out for many, although there were still some spits and spots through central swathes of the UK. The cloud was dense in places and over the hills there remained a fair amount of low cloud giving some mist and hill fog. To the west, across southwest Wales, southwest England, Northern Ireland and parts of western and northern Scotland it was a fine day with plenty of sunny spells, once any mist and fog cleared from Northern Ireland. There were some brighter spells across eastern England too, and in any sunshine it felt pleasantly warm.

### Summary of the UK Weather for Tuesday 26 September 2017

It was a mild night across much of the UK with widespread mist and fog. However, there were some clear spells too. Where the cloud thickened a few places saw some light drizzle.

After a misty and murky start across much of the UK it became brighter from the west with some bright and sunny spells developing widely. Some coastal mist and low cloud did linger along the east coast of Scotland and northern England. With generally light southerly winds and sunny spells it was a fairly warm day, particularly in southeast England. Through the evening, mist began to reform across many parts of central and southern England.

### Summary of the UK Weather for Wednesday 27 September 2017

Most places across the UK stayed dry overnight with light winds. Under clear spells, mist and fog patches formed across parts of England and Wales. However, strengthening winds across northern parts kept mist and fog at bay, with some patchy light rain arriving into Northern Ireland towards dawn. The stratus, mist and murk that formed across the southeast lifted slowly into scattered to broken stratocumulus with visibilities improving slightly, although some pockets of haze remained into the afternoon. The band of locally heavy rain that had made eastward progress overnight had reached Cornwall and Devon and Northern Ireland by midday with some strong and gusty southerly winds in the southwest. Rain began to clear Cornwall by the evening although with rain remaining across Northern Ireland where they saw 10-15 mm in 3 hours through the afternoon and 15-20 mm in 6 hours.

### Summary of the UK Weather for Thursday 28 September 2017

A band of rain spread eastwards across all parts overnight into Thursday morning, with some heavy bursts along the south coast of England and over the Scottish Highlands. By dawn the rain had cleared from all but the eastern fringes of England and Scotland, with clearing skies further west allowing areas of mist, patchy fog and low cloud to form. The day was generally fine and dry for many, with bright or sunny spells across most of the UK. However, the band of cloud and rain which had cleared mostly away into the North Sea continued to affect the far northeast of Scotland, particularly the Northern Isles, with brisk southerly winds. Meanwhile, the next Atlantic frontal system pushed in across Northern Ireland during the afternoon. By the evening rain continued to affect Northern Ireland and pushed into western parts of Scotland.

### Summary of the UK Weather for Friday 29 September 2017

Through the early hours, a weather front brought cloud and rain to western parts of the UK with some showery rain moving across the far southeast, but it was a dry and clear start across Northern Ireland.

The band of rain produced some heavy outbreaks at times, and moved from west to east across the UK. The rain gradually cleared away to the east, with the exception of the far northeast of Scotland, where it was a rather wet day across the Northern Isles, with strong winds. It was an improving picture from the west, with sunny spells developing across many western parts of the UK. However, there were some showers feeding into parts of Northern Ireland and western parts of Scotland during the afternoon, where they turned heavy and thundery in places.

Temperatures were around average for the time of year.

### Summary of the UK Weather for Saturday 30 September 2017

Through the early hours, it was cloudy across southern parts of the UK, with clearer skies further north. There were a few showers in western parts of Britain, which turned heavy for some.

Showers affected western parts of the UK throughout the day, including some heavy ones in Cumbria during the morning, with some localised flooding. Showers moved away from northwest England into northeast England and the East Midlands during the afternoon. Eastern Scotland and the southeast of England stayed mainly dry. Winds were light except in the far southwest and far northwest. Temperatures were round about average for the time of year.

## Daily Weather Summary for Saturday 30 September 2017

## Daily Weather Summary for Saturday 30 September 2017

None of the selected stations observed a day of sleet or snow falling or non-zero snow depth at 0900 UTC.

## Guidance Notes

UTC = Universal Coordinated Time. For the UK UTC is the same as GMT (Greenwich Mean Time).

National boundaries shown on the European station map are for illustrative purposes only.

### Daily extremes

- Data in the table have been manually checked unless denoted by an asterisk.
- Checked values have been manually confirmed by Met Office Observations Quality Management as valid observations from the live database at the time of checking. However, more extreme values may still be possible if they occur after the time of production.
- Asterisked values have been automatically extracted from the live database with no further quality control carried out beyond normal Met Office procedures. This means that some suspect data are possible.
- Duplicate values will be presented if these occur, allowing for up to 10 duplicates.
- Mountain stations above 500 masl are excluded from lowest temperatures, highest gust speeds and greatest snow depths at 0900 UTC. This is because they are not considered representative of low level areas.
- Counties quoted against each station are based on historical county boundaries pre-1974 and may not reflect current administrative boundaries.

### Analysis charts and satellite imagery

- The satellite imagery is infra-red imagery from the geostationary MSG satellite.
- The rainfall image is derived from satellite data from MSG and rain-radar data. This represents a snapshot of instantaneous rain-rates at 0000 UTC and 1200 UTC and so does not necessarily reflect daily accumulations in the rainfall station map.
- Any analysis charts or satellite images which are unavailable will be displayed as white space.

### Station maps

- The UK maps show station data for the same set of stations presented UK data table. These stations are selected to provide good spatial coverage across the UK; they represent only a fraction of the overall UK observing network.
- Wind speed maps show wind speed in Kt and direction both averaged over the hour up to the time of observation. 1 Kt = 1.151 mph.

## Hourly station data

- The data tables provide spot hourly observations from synoptic messages at 0000 and 1200 UTC. Missing data are denoted by '-'.
- Pressures are mean sea level pressure in hPa.
- For UK stations, Gibraltar and Jersey, the wind speeds and directions are both averaged over the hour up to the time of observation. However, for European stations wind speeds and directions are both averaged over a 10-minute period up to the time of observation.
- Wind speeds are in Kt. Wind directions are stored in the database every 10 degrees and have been converted to the nearest point of the compass. These give the direction the wind is blowing from, not to.
- Cloud amounts are in Oktas from 0 (clear) to 8 (overcast). 9 indicates sky obscured (eg by fog).
- Air temperature and dew point temperature are in Celsius.

## Temperature maps

- Daily maximum, minimum and grass minimum temperatures are in Celsius.
- The period for the daily maximum temperature on day D is defined from 0900 UTC day D to 0900 UTC day D+1.
- The period for the daily minimum and grass minimum temperatures on day D is defined as 0900 UTC day D-1 to 0900 UTC day D.
- On any given day D the minimum will typically occur in the early hours of the morning and the maximum in early afternoon.

## Rainfall, sunshine and max gust speed maps

- Daily rainfall is in mm from 0900 UTC day D to 0900 UTC day D+1.
- Daily sunshine is in hours from Kipp and Zonen CSD1 automatic sunshine records. Bright sunshine is defined as exceeding 120 W/m<sup>2</sup>.
- Max gust speeds are the daily max gust in Kt from 0000-0000 UTC

## Snow maps

- The day of snow falling map displays data from present weather sensors, showing stations which have recorded sleet or snow falling at any point in the day (0000-0000 UTC).
- The snow lying map shows level snow depth as recorded by the automatic snow depth sensors at 0900 UTC. These snow depth sensors do not record snow depth if this is less than 2cm.

- Snow depth sensors are normally operational from October to April, in the event of snow falling outside this period data availability may be limited.
- Snow maps will only be displayed if one or more of the selected stations on that date have recorded either snow falling or non-zero snow depths. If snow maps are not displayed it is still possible that other stations in the network have recorded a day of sleet or snow falling or non-zero snow depth.
