Daily Weather Summaries for December 2023

If you have any questions or feedback about this product or wish to obtain further data please contact the Met Office.

This document contains daily weather summaries for each day of December 2023. The Met Office National Meteorological Library and Archive holds a continuous record of daily weather summaries or daily weather reports from 1860, and these daily weather summaries form a continuation of that series.

The purpose of each summary is to provide an overview of the weather conditions across the UK on that day, with the historical emphasis mainly based on observations from surface network of weather stations, although the format has varied over the decades. While the emphasis remains on observations from the surface network, the current daily weather summaries supplement these by including satellite and rain-radar imagery to provide a more complete overview. The current format of the daily weather summaries is as follows:

1. Text summary of the main characteristics of the weather during the day, written by an operational meteorologist in the Met Office operations centre.
2. Table of daily extremes for the UK for key climate variables including temperature, rainfall, sunshine and gust speeds.
3. Overview of the synoptic situation at 00 and 12 UTC comprising: analysis charts showing the surface pressure pattern and associated weather fronts; North Atlantic and European infra-red satellite images showing cloud-cover; combined infra-red and rain-radar images of the UK; maps of wind speed and direction at 00 and 12 UTC; observations of pressure, wind speed and direction, cloud cover, air and dewpoint temperature at selected UK and European stations in data tables.
4. UK maps of key climate variables from observing stations including maximum, minimum and grass minimum temperature, rainfall, sunshine, gust speed and snow.
5. Further guidance notes

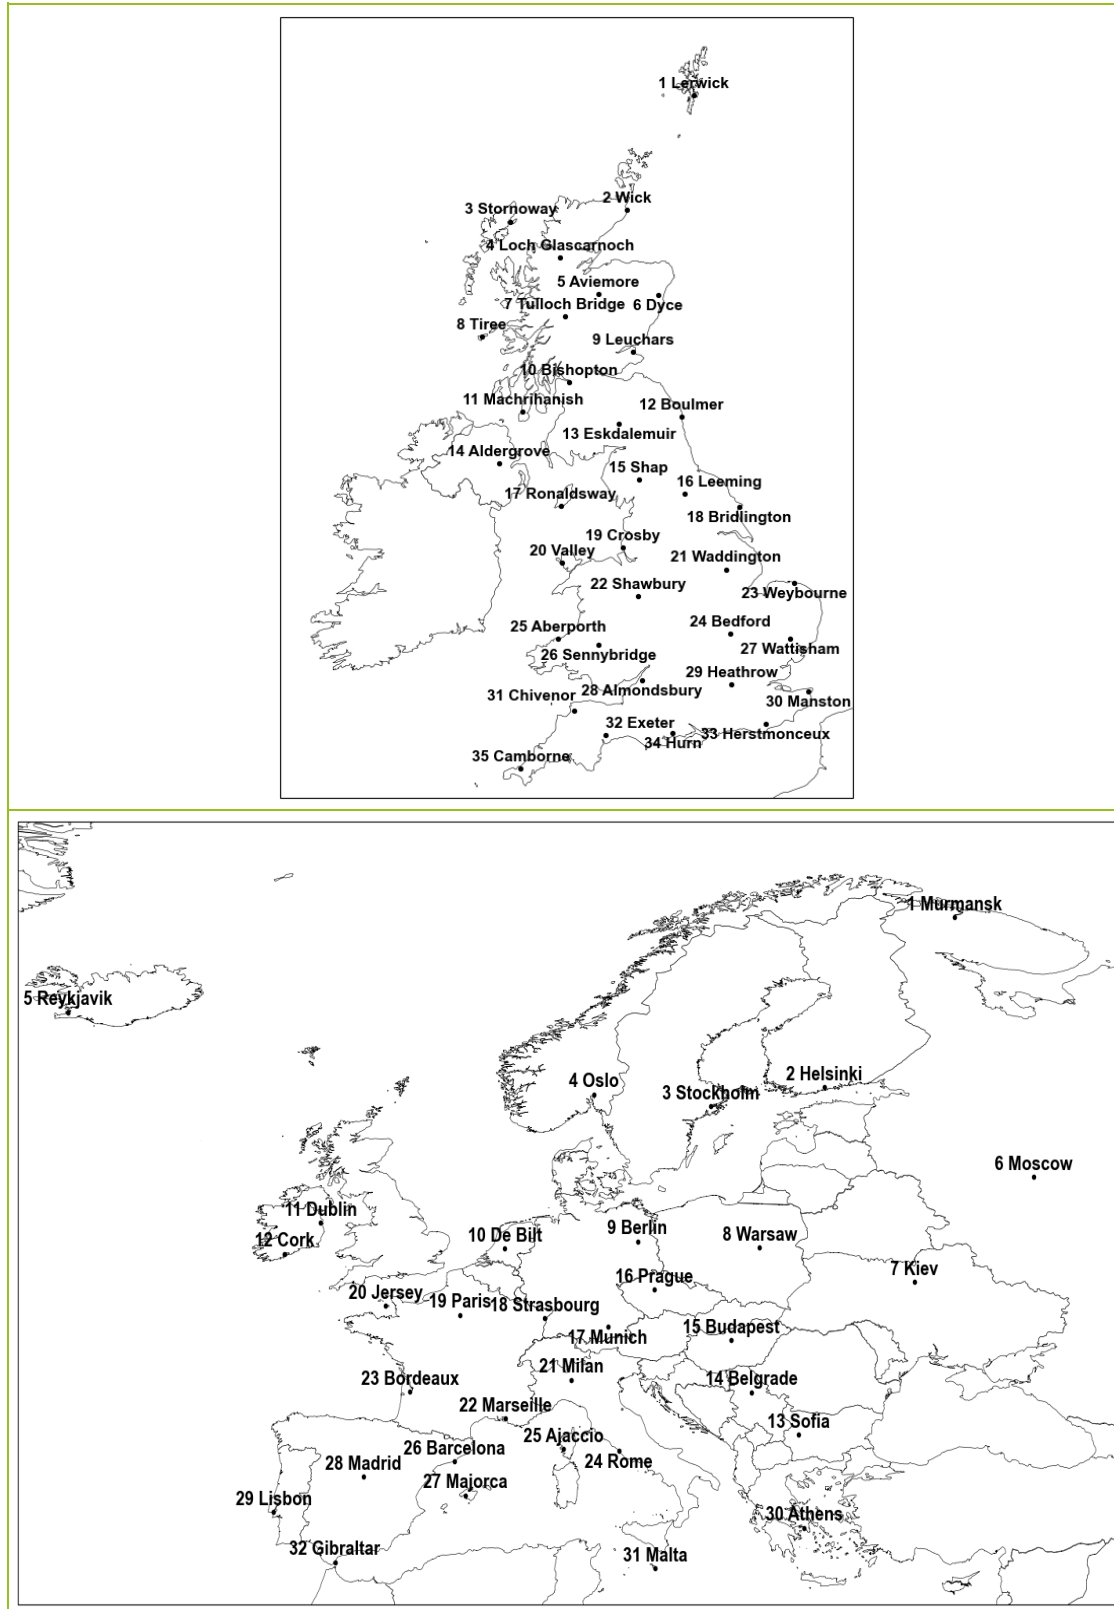

If you spot any data errors or omissions in this product please contact the Met Office.

Daily Weather Summary for Friday 01 December 2023

This day's summary created 08/12/2023 03:03

Summary of the UK Weather for Friday 01 December 2023

Scattered showers continued across most coastal areas including the eastern edge of the UK, northwest Scotland, Northern Ireland, and northwest Wales. Inland it was largely clear and dry although there were mist and large freezing fog patches across central southern England, with smaller patches further north. Winds were light and temperatures well below freezing for many, with the mildest conditions in the southwest where some cloud lingered. Cumbria. Friday was mostly dominated by Low pressure. A cold and fairly dry theme was observed through the day, with scattered showers across most coastal areas, especially the eastern coastline. Overall wintry with a mix of sunshine and below average temperature for time of the year, the best of any milder conditions was confined to the southeast. A cold night with frost and fog development, as well as snow over northern high ground. Winds were light and variable through the day.

Summary of the UK Weather for Saturday 02 December 2023

Overnight freezing fog/low cloud across central and southern areas persisting in places. Most of the UK was dry and cold with sunny spells in the morning. Wintery showers in northern coasts, were heavier inland southern Scotland and wintery over hills. Showers or rain moved into Wales and west midlands. Freezing temperatures across most of the UK with double digits in the far North. Saturday continued under a cold theme with plenty of clear skies. Fairly dry for most parts, with precipitation primarily happening along the western coastline. Wintry with snowfall over northern high ground. Low pressure was the dominant feature, resulting in several troughs, which generated few showers over the UK, especially along coasts. Winds were variable, but predominantly southwesterly, and light. Into the evening showers pushed from the west into land which brought some heavy snowfall into the northwest of England, in places such as Cumbria. Temperatures were below average for the time of the year.

Summary of the UK Weather for Sunday 03 December 2023

Wintry precipitation moved eastwards from the west through to eastern areas by dawn whilst, showers, heavy at times, moved into the southwest and south Wales. A severe frost affected some areas of northern and central Scotland. Sunny spells affected western Scotland and Northern Ireland too, however coastal showers affected parts of Scotland. Across much of England and Wales, it was cloudy with outbreaks of rain with sleet and snow affecting parts of north Wales and the south Pennines. Through the evening, rain continued and became heavier for parts of southern and south-west England and south Wales. In contrast, it was mainly dry with clear spells across Northern Ireland and western Scotland in particular, but wintry showers affected eastern parts, especially over hills. It became blustery across southern parts of England, especially along the English Channel coast as gradients increased here.

Summary of the UK Weather for Monday 04 December 2023

Low pressure moved across southern UK and pushed a warm front and occlusions northeastwards bringing heavy rain to parts of the south. Northeastern UK remained showery, while the northwest had the best of any drier conditions but snow occurred in parts of northern England and Scotland. It was mainly cloudy with near average temperatures in the south, however areas in the north and northwest remained cold. Sunny spells and showers affected parts of Northern Ireland and northern Scotland, these wintry at times. Across England and Wales, it remained cloudy with outbreaks of rain. A quasi-stationary occlusion brought persistent, heavy rain across the southwest Midlands, through south Wales and parts of the West Country with reports of flooding across Somerset and Dorset. Through the evening, outbreaks of rain continued across England and Wales with some heavy outbreaks across northeast England. It remained cold across Scotland with a frost in northern and inland parts.

Summary of the UK Weather for Tuesday 05 December 2023

Tuesday started broadly wet, as a low pressure centre moved eastwards across southern parts of the country. Three occluded fronts in association with this low centre, lingered across most of the UK, bringing rain for much of England and Wales, heavy in places. Scotland remained fairly dry where temperatures were generally near average, however, feeling cold across some Scottish regions. It was cloudy for most of the UK, with some clear spells in the northwest and often breezy, with moderate to fresh easterly winds being predominant. As the morning progressed, this large area of rain eased and cleared to the southeast during the afternoon, leaving behind scattered moderate showers across eastern parts, these heavy in places, along with a line of showers across the Irish Sea. As this rain cleared, cloud dispersed, leaving largely clear skies. It was a cold evening for many as temperatures began to drop, particularly across Scotland. High cloud began to spread across Northern Ireland overnight as a system approached from the west with winds strengthening here.

Summary of the UK Weather for Wednesday 06 December 2023

A slack pressure pattern allowed quiet, benign weather conditions overnight across the UK with mainly dry conditions prevailing. A widespread frost was reported across central and northern UK as areas of mist and freezing fog developed as skies cleared and gradients remained slack. Southern England and south Wales were affected by low cloud, mist and fog and rather murky conditions with less cold conditions here. A few showers drifted southwards across the Lincolnshire coast into parts of East Anglia whilst more general rain moved into the west of Northern Ireland as a frontal system approached. Patches of freezing fog and mist lingered through the day across parts of Scotland, and the south and west of the UK. Eastern areas were otherwise largely clear and cold. Across the western half it was milder, with winds increasing in strength as rain crossed Northern Ireland, southwest England, and Wales, heavy in places. This frontal system continued eastwards into the evening, with rain covering most western parts of the UK with milder air advancing.

Summary of the UK Weather for Thursday 07 December 2023

Cloudy skies with outbreaks of rain gradually edged eastwards across most of the UK overnight with some locally heavy bursts in places. It became windy across much of the UK with winds reaching gale force along some coasts, especially in the west as gradients steepened ahead of a deep Atlantic low. A series of fronts, associated with an Atlantic depression located to the west of the UK, moved steadily northeastwards across the country, bringing widespread, persistent rain to many. The heaviest rain fell over Northern Ireland and southwest England, with smaller areas in northwest England and southwest Scotland also seeing some heavy periods in the afternoon. Strong, gusty winds accompanied the rainfall, particularly in coastal areas. There were drier periods through the day as well, notably in the east and southeast during the morning before the rain arrived and in the west in the late afternoon once the rain had passed, but these periods remained cloudy for the most part. Temperatures were widely above average for the time of year, and noticeably milder than in previous days, particularly in the south and away from the rain.

This day's summary created 15/12/2023 03:05

Summary of the UK Weather for Friday 08 December 2023

Rain and strong wind from the previous day cleared northeast Scotland in the early hours, followed behind by patches of fog, low cloud and showers. These showers were heaviest over high ground, particularly across Wales and northwest England. Another showery band of rain swept across Northern Ireland, reaching western Scotland by dawn. Mist and fog persisted into the morning, particularly across eastern England. A much milder night than previous days. Rain and showers continued to sweep across Northern Ireland, Wales and western Scotland and England through the morning, while eastern areas, particularly the southeast remained mostly dry. Southeast England also saw plenty of clear spells, though it was cloudier further north. Further heavy rain fell across Northern Ireland during the afternoon, with widespread showers continuing to affect Wales, West Midlands, northwest England and much of Scotland. Temperatures were mostly above average for the time of year, though feeling less mild than might be expected due to strong westerly winds, particularly around exposed coastal areas.

Summary of the UK Weather for Saturday 09 December 2023

The remnants of a wrap-around occlusion moved across Scotland overnight. Elsewhere was mostly cloudy and dry to start the night, but to the southwest, a series of fronts moved quickly northeastwards, covering most of England, Wales and Northern Ireland with rain by dawn, with heavy bursts in places. A band of rain moved north-eastwards across Scotland this morning followed by another rain band across much of Wales and England. A yellow weather warning for rain was set for today for Northern Ireland, parts of eastern and central Scotland. Winds were particularly strong and gusty, with gales in the northeast, severe in coastal Northern Ireland and the Irish Sea coasts and the British Channel.. This evening, rain across the northern half of the UK became lighter and patchy across northeast England, also clearing from Northern Ireland.

This day's summary created 17/12/2023 03:06

Summary of the UK Weather for Sunday 10 December 2023

Patchy rain and showers from the wrap-around occlusions associated with Storm Elin, located off the east coast of England at the start of the night, eased and cleared away from the UK early in the morning, lingering longest over central and north-eastern Scotland and parts of northern England. Elsewhere there were clear spells in the south, Northern Ireland and, closer to dawn, parts of western England. Central and eastern England saw strong winds early, but these eased over the course of the night from west to east as Storm Elin moved further into the North Sea. It remained above freezing for much of the UK with the south particularly mild. Storm Fergus moved east bringing further severe gales across parts of Ireland today. Fergus tracked to the UK early this afternoon, with the strongest winds on its southern flank affecting many western areas. There was heavy rain in central and southern Scotland which extended into northern England and northern Wales during the afternoon as Fergus moved southeast. There were strong westerly to south-westerly winds during the day.

Summary of the UK Weather for Monday 11 December 2023

Storm Fergus moved west to east across central England during the early hours, bringing strong winds to much of central and southern England and Wales. Rain and showers also affected parts of Wales and the East Midlands, easing later on. Northeastern parts of Scotland also saw rain throughout the night, which lingered into the morning. It was largely clear in the south and for parts of northern England and Scotland. Temperatures remained above average for much of England and Wales, but dropped to freezing levels in the north of Scotland. Mostly cloudy skies affected central areas of England and eastern parts of Scotland with showery rain in places. Either side, it was dry with some sunny spells. Through the evening, an active cold front moved in from the west, affecting Northern Ireland initially before moving eastwards across some western areas of England and Wales, with some heavy rain or showers and squally winds. It was chilly with clear spells across eastern portions of England.

Summary of the UK Weather for Tuesday 12 December 2023

A rain band moved eastwards across the UK in the early morning to south and central Scotland and the east of England by sunrise. Clear spells throughout the morning with showers focussed on Scotland and Northern Ireland. Low impact Yellow rain warnings were issued for Northern Ireland, southwest and central Scotland and southeast Scotland/northeast England. A band of heavy rain cleared eastern England at first but lingered across eastern parts of Scotland. Further south, a slack low and pool of unstable air covered much of England and Wales with numerous showers or areas of showery rain affecting southern and central areas, some were heavy with isolated thunderstorms reported across southern England. This evening, showers and longer spells of rain continued across southeast Scotland and eastern portions of England with occasional showers affecting parts of the west. An occlusion gave a thin band of showers across central England from east to west. Clear spells in western parts of Northern Ireland and far northwest of Scotland.

Summary of the UK Weather for Wednesday 13 December 2023

A low slowly moving to the east of the UK brought some showers and rain in central and western Scotland and parts of north-western England during the early morning which extended and was heavier in the south of Scotland and Northern England later in the early morning but steadily lost intensity. Throughout the morning were also showers and strong northerly winds down the Irish sea affected far west Wales and the far southwest. Strong north easterly winds affected northeast England. Clearer skies developed across north and west Scotland where there was patchy frost. During the day, showers continued to affect many eastern areas, merging into slightly longer outbreaks of rain in Lincolnshire and the southeast at times. Showers reduced in extent from eastern Scotland through the afternoon, and many central and western areas became dry apart from some showers clipping Pembrokeshire and western Cornwall. Central and eastern areas of England were mostly cloudy, while western areas saw some longer spells of sunshine, especially for Western Scotland and Northern Ireland which were mostly sunny. Winds were moderate for central and southern areas, light for Scotland, locally strong near the east coast.

This day's summary created 21/12/2023 03:04

Summary of the UK Weather for Thursday 14 December 2023

Thursday started dominated by high pressure, especially over the south. A warm front, followed by a cold front, moved southeastwards over western parts of the UK. This created a band of precipitation that affected Scotland North Ireland, Wales and western parts of England, as the couple of fronts pushed southeastwards. Cloudy under the fronts, clear skies with patchy cloud otherwise. Winds were light and westerly for most, but strong over the North. Temperature were above average for the time of the year. Through the day, the frontal system bringing cloud and patchy drizzly rain gradually sank southeast, becoming confined to the southeast through the afternoon. Many other areas became mostly dry with some sunny spells, especially to the lee of high ground. Southeast Scotland and Northeast England was one area that became mostly sunny, while western upland areas remained mostly cloudy. Some showers affected Scotland, mainly in the west, with a few showers seen over parts of Northern Ireland, northwest England, Wales, and southwest England. Winds were generally light, moderate in Scotland and Northern Ireland.

This day's summary created 22/12/2023 03:03

Summary of the UK Weather for Friday 15 December 2023

Mostly cloudy skies occurred across England and Wales with a few clear intervals in places. It was chilly under any clear intervals with patchy mist and fog developing locally. Thicker cloud produced showery outbreaks across parts of western Scotland, Northern Ireland and northwest England whilst any showery rain over southeast England initially, cleared southeastwards. It was a dry day for most, but cloud became increasingly more widespread through the morning. The far north of Scotland saw some rain in the afternoon, at times turning heavier, with winds increasing here too, while there was also some lighter drizzle over parts of central and southern Scotland. A generally light southerly wind meant that temperatures stayed above average for the time of year in the south and north. Through the evening, further patchy rain and drizzle continued in western areas of Scotland, with drizzle also reported in parts of northwest England and Wales, but it remained dry elsewhere, with a few clear spells developing in the southeast.

Summary of the UK Weather for Saturday 16 December 2023

Mild southwesterly winds covered the UK, and many areas were cloudy. A few cloud breaks with lower temperatures in the south filled in during the night. Patchy drizzly rain continued to affect parts of western Scotland, and hill fog and patchy drizzle was reported around other western and southwestern coasts. Further outbreaks of rain began to affect the far northwest towards Dawn. Winds gradually increased to become strong in northwest Scotland.

Elsewhere winds were mainly moderate, and light further south. It was mild or very mild everywhere by the end of the night, especially in Scotland. Rain persisted across northwest Scotland throughout Saturday and into the night due a stalled frontal system. This rain was heavy at times, particularly over higher ground, and accompanied by strong winds across the wider area of Scotland. Elsewhere high pressure dominated, and it was mostly dry and cloudy, particularly in the south and west. A bright day in some central and eastern parts of England with clearer patches of sky, but cloud thickened into the evening, bringing a widely mild and cloudy night.

This day's summary created 24/12/2023 03:03

Summary of the UK Weather for Sunday 17 December 2023

Overnight into Sunday morning, persistent rain continued to affect the northwest of Scotland, this was heavy across hills and mountains with significant totals building up. Elsewhere, there was patchy drizzle and low cloud across some western hills and coasts. Many areas were cloudy, although with some cloud breaks to the northeast of high ground.

Southwesterly winds gradually strengthened, becoming strong towards the northwest of the UK, although light to moderate in the south. It was a mild night nearly everywhere. Heavy rain continued to fall over western parts of Scotland and Northern Ireland through the day, sinking southwards later as well to affect southern Scotland and northern England as well and continuing through the evening. Away from these areas, it was a cloudy day, with some brighter spells across eastern areas at times, and remained largely dry. It was another windy day, with the strongest winds in western Scotland and in coastal areas, but remained mild as with previous days, particularly in the northeast of Scotland.

Summary of the UK Weather for Monday 18 December 2023

Patchy light rain and drizzle fell over western parts of the UK, these areas drifting further south towards dawn, associated with a waving front across England and Wales and cold front further north across Scotland. Some areas of low cloud alongside these patches, particularly across northern England and Wales. Moderate winds through the early hours. It remained mild for most but some colder patches returned to the north. Heavy showers in the west of England and Wales this morning faded out throughout the day. A narrow band of rain in the North moved south and reduced. The southwesterly winds were overcome by the northwesterly/ westerly winds that came with the cold front as it moved into England tonight. Gusty winds up to 40mph. Local frost towards north Scotland overnight with showers continuing, some wintry.

Summary of the UK Weather for Tuesday 19 December 2023

A series of fronts progressed southeastwards through the early hours, bringing rain to large parts of England and Wales, this heavy at times, along with cloudy conditions. Southern Scotland remained mostly dry but further north there were blustery showers. Towards dawn, tightening pressure gradients brought strengthening northwesterly winds across the far northwest. Mild in the south but dropping below freezing in some Scottish spots. A double structured cold front across southern parts of the UK brought a broad area of rain here, clearing southeastwards with time with some heavy spells across the south. Within the post frontal air mass, brighter skies advanced southwards but some instability across Northern Ireland and Scotland resulted in locally heavy showers. Through the evening, it remained mostly dry with clear spells across southern England and Wales, but showers affected portions of northern England, Scotland and Northern Ireland, wintry across northern Scotland.

Summary of the UK Weather for Wednesday 20 December 2023

The early hours of Wednesday has seen some showery conditions lingering over Scotland and northern England due to a trough across the area. A warm front pushing in from the west has further pushed showery weather into the country ahead of clearer conditions behind it. Outbreaks of rain occurred further south into central areas of the UK and coastal areas of Wales and southwest England. Winds were blowing southeasterly. Areas of rain moved southeastwards across parts of the UK through the day, mainly across northern and western parts but some drier spells with limited brightness occurred towards southeast England. Into the evening, It was mainly dry but mostly cloudy with the odd spot of rain across eastern and southeastern portions of England, but further outbreaks of patchy rain and drizzle moved southwards across much of western UK, heavy across north and northwest Scotland. Widely windy across the UK but gales developed over northern Scotland. By midnight, a cold front began to approach from the south across Scotland.

This day's summary created 28/12/2023 03:05

Summary of the UK Weather for Thursday 21 December 2023

A trough brought heavy showers to Scotland, mainly the northwest, then extended south across Scotland and the far north of England through the early morning. Some heavy showers also occurred in the north of England and the Midlands throughout the morning. Strong westerly winds across the UK with gusts to gale force in places. Storm force winds for a time this morning across far north/ northeast, especially Shetland with disruptive weather across many northern and central areas of the UK. Localised heavy showers with hail/isolated thunder affected northern Scotland, turned wintry over hills with snow across Shetland throughout the day. During the day it remained blustery with Storm Pia drifting slowly eastwards away from the UK. The passage of a couple of cold fronts brought bands of rain, as well as blustery showers, especially to western and northern parts of the UK, such as Wales, Northern Ireland and Scotland. It was cloudy for many. A northeast-southwest split was observed in terms of temperature, with milder conditions in the southwest while the northeast remained cooler.

Summary of the UK Weather for Friday 22 December 2023

Snow showers in Shetland, with an ice risk. A band of rain ran from the northwest to the southeast gradually moved eastwards, with showers and clearer skies following whilst heavier precipitation occurred amongst hilly areas to the west. North Scotland saw some hill snow whilst it remained drier across much of eastern of England and southern England. Windy for all areas with localised gales Cold in north and northeast Scotland, otherwise mild. Rain continued across northern Scotland, moving west to east through the morning and early afternoon, before a second front brought renewed heavy rain to the northwest mid-afternoon. Patchy bands of rain also affected parts of Northern Ireland, northern and western England and Wales through the day. Further south and east mostly remained dry, albeit cloudy. It was another windy day across the UK, with some local coastal gales in the west. Temperatures remained widely above average.

Summary of the UK Weather for Saturday 23 December 2023

Mostly dry conditions affected much of southern and southeast England but outbreaks of patchy rain affected Wales, the Midlands, northern England and Northern Ireland. A waving warm front brought a broad area of heavy rain across much of central Scotland, with heavy snow across northern and northeast portions of Scotland which brought an ice risk here. It was windy along coasts. Into the day time, it was mostly dry across most of England with showery conditions seen in the western coastal areas. In the north in Scotland, and parts of the Pennines, rainy conditions were affecting the areas. This was brought by the warm front over the area. Winds were moderate blowing easterly.

This day's summary created 31/12/2023 03:03

Summary of the UK Weather for Sunday 24 December 2023

Sunday started under the influence of a low pressure centre, to the northwest of the UK. This drove a breezy start, with a predominant westerly flow across the country. A warm front, followed by a cold front, slowly drifted across most areas, bringing rain, heavy at times, for Wales, as well as central, northern and south-western parts of England. At the same time a cold front arrived to northwestern parts of Scotland, bringing a large area of rain. Generally cloudy, with some cloud breaks in the north later on. Temperatures were above average for the time of the year. During the day, a double frontal feature travelling down south across the country brought showery rainy weather to England in the early parts of the day. Later, an occlusion arrived to the north of Scotland which brought further showery conditions to the area. These rainfall were heavy at times, easing off as the day went on. Elsewhere it remained generally cloudy with a strong westerly wind, especially in the south.

Summary of the UK Weather for Monday 25 December 2023

Christmas Day began cloudy across southern areas of the UK, with rain associated with a cold front affecting the southwest. Northern and eastern areas had some clear spells, which led to some ground frost in parts of Scotland. Through the night, patchy rain and showers affected parts of Northern Ireland and northwest England, while the rain in the southwest worked its way east, clearing by dawn. Winds were strong in the south, and eased later in the night, but much lighter in central and northern regions throughout the early morning. The cloud across the south also contributed to notably mild temperatures in these areas. During the morning, generally cloudy conditions continued in southern and central areas, with patchy drizzle or rain in places, mainly western hills. Through late morning and afternoon, more persistent rain set in across Wales, spreading east across the midlands and East Anglia, and later southwest England. Further north, showers continued, locally heavy, especially in Scotland. North Scotland and the highlands saw outbreaks of rain turn to snow in places, mainly over hills. It was cold with light winds here, and mild for the rest of the country with moderate southwesterly winds, stronger around coasts.

Summary of the UK Weather for Tuesday 26 December 2023

Boxing day started off with some showery and rainy weather clearing in the early morning due to the low pressure moving aside leaving the UK. This has brought clear skies during the early hours for most. Some showers and rainy weather were still seen in northern Scotland and some parts of the Pennines, along with the coasts. The wind was blowing from the west or northwest. The morning was generally quiet with moderate winds in the east easing, and light winds elsewhere. Showers affected northern and western Scotland, and the north coast of northern Ireland. These became increasingly confined to the far north of Scotland through the day. Elsewhere, it was dry, and the morning started sunny for many, although high cloud ahead of the next frontal system quickly spread northeast, covering many areas away from Scotland by the end of the day, however it remained generally dry and fine with light winds. The exceptions were the showers in the far north of Scotland, and outbreaks of rain moving into southwest England through the late afternoon. This rain spread into southern England and Wales through the evening

Summary of the UK Weather for Wednesday 27 December 2023

The night started off mostly calm for more northern and eastern areas; however, weather fronts ahead of Storm Gerrit brought wet and windy conditions spreading northeast the country. The rain was mostly light to moderate. Winds strengthened, blowing from the southeast and south. Temperatures were cold in the north, and increasingly mild in the south. During the morning, persistent rain over England and Scotland continued northeastwards, turning heavy in places, and falling as snow over high ground in Scotland. Further fronts and troughs moved eastward across Wales and southern England. Into the evening and overnight many of these features turned squally and thundery, particularly to the southwest and close to Shetland. Winds increased throughout the day, easterlies in the north, veering southwesterly further south. Severe gales and storm force winds occurred in places, especially coastal Scotland. Overnight it was cooler in the north and milder in the south with some drier interludes amongst outbreaks of showers. There were some organised, squally and thundery bands, particularly for Wales and northwest England later in the evening.

This day's summary created 04/01/2024 03:03

Summary of the UK Weather for Thursday 28 December 2023

During the early hours, squally, locally heavy and thundery showers continued to move east-northeast across many areas, clustering together at times over northwest England and Wales, although some eastern areas saw relatively fewer showers. Eastern Scotland and Northern Ireland was mostly dry through the early hours. England and Wales saw strong southwesterly winds, gusty around showers, while Shetland saw storm force winds with sleet and snow, though this eased and turned to rain by the end of the night. Heavy, blustery showers continued to progress eastwards across the UK during the day, with some thunder and squally conditions across Wales, northwest England, Northern Ireland and northwest Scotland. These showers were associated with occluded fronts and troughs across various parts of the UK. The most persistent showers affected western parts, and later included some longer outbreaks of rain in western and central Scotland. It remained windy for many, especially near western coasts, although a lighter northerly wind affected northern Scotland into the evening. Milder temperatures remained in the south but conditions were colder in Scotland.

This day's summary created 05/01/2024 03:52

Summary of the UK Weather for Friday 29 December 2023

Through the early hours, further showers continued to move eastwards across the UK, often loosely organised in bands or clusters, although with some significant dry gaps. The most frequent showers were towards western areas, some eastern areas stayed dry. Central and Southern Scotland, and Northern Ireland also saw some more organised bands of showery rain due to occluded fronts. Winds remained fairly strong for central areas of the UK, more moderate for central and southern England, and light in northern Scotland, where it was colder. Temperatures were mild in the south. During the day a couple of occlusions lingered across northern parts of the UK, these causing areas of precipitation, especially in north and western regions. These showers and rain tended to move eastwards affecting Northern Ireland and north England at first, but reaching Wales and Central parts of the UK. The far northeast of Scotland remained unsettled as a low centre was nearby, promoting wet and windy conditions. However, high pressure was not far away pushing dry and clear spells, over western and southern regions through the day. Light to moderate westerly winds were recorded through the day. Fairly cloudy with clear spells in the southeast and southern Scotland.

Summary of the UK Weather for Saturday 30 December 2023

A largely clear and dry night across the UK early on Saturday. There were some showers over northeast Scotland, brought by northerly winds, some also lingering across central areas, most of these light. A frontal system approached from the west overnight. By dawn, this system brought rain across Northern Ireland, Wales and parts of England, and winds started to pick up in strength. A widespread frost in Scotland, but the south holding on to milder air. During the day a low pressure centre approached the UK from the Atlantic. Therefore an unsettled theme was observed through Saturday, with a large area of rain moving south-westwards affecting most of the country, as well as showers especially over eastern coastal zones. Scotland saw a considerable amount of snowfall in northern and central regions, this generating several impacts. It was a breezy day, with strong winds across western areas. Cloudy and mild for many, however temperatures were slightly above average in the south.

This day's summary created 07/01/2024 03:04

Summary of the UK Weather for Sunday 31 December 2023

A cold front swept eastwards across southeast England, with line convection at its leading edge bringing squally conditions and some lightning strikes around midnight. Behind this front winds were lighter, though still breezy around coasts and some moderate rain remained for a time across southern England, briefly dry in the central areas. Into the early hours of New Year's Eve, blustery showers began to make landfall across western parts of the UK and progressed eastward into the morning. Temperatures around average or slightly cooler than average in the north. Clear spells throughout the day across the UK with scattered showers, heavy in the south of Northern Ireland, following into the north of England where an occlusion moved across from west to east. The heavy showers lightened into the evening; scattered showers continued across most of the UK. Scotland saw very few showers but had heavy showers focussed on the southwest coast. There was a yellow rain warning set for northwest England for this evening and night. Blustery winds throughout the day in the south and south Wales, where a yellow wind warning was set for south coastal areas and the southwest.

Daily Weather Summary for Sunday 31 December 2023

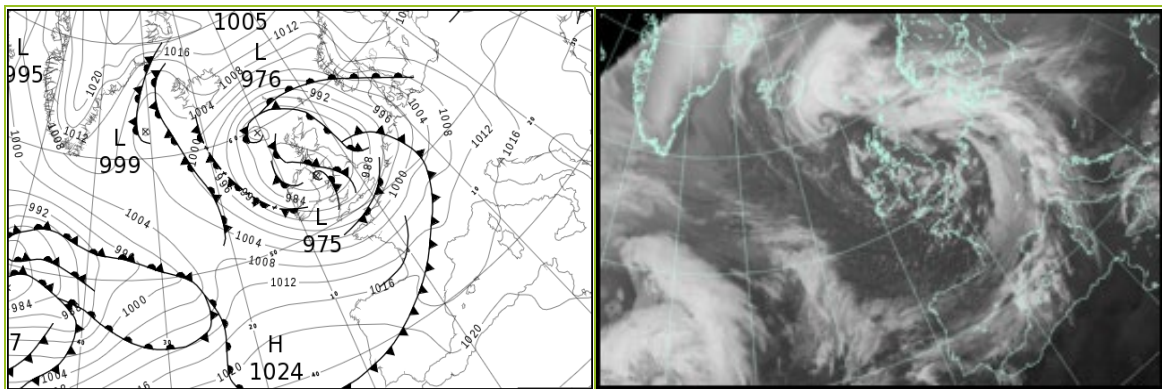

Daily Weather Summary for Sunday 31 December 2023

None of the selected stations observed a day of sleet or snow falling or non-zero snow depth at 0900 UTC.

Guidance Notes

UTC = Universal Coordinated Time. For the UK UTC is the same as GMT (Greenwich Mean Time).

National boundaries shown on the European station map are for illustrative purposes only.

Daily extremes

- Daily extremes have been manually confirmed by Met Office Observations Quality Management as valid observations from the live database at the time of checking. However, more extreme values may still be possible if they occur after the time of production.
- Mountain stations above 500 masl are excluded from lowest temperatures, highest gust speeds and greatest snow depths at 0900 UTC. This is because they are not considered representative of low level areas.
- Counties quoted against each station are based on historical county boundaries pre-1974 and may not reflect current administrative boundaries.

Analysis charts and satellite imagery

- The satellite imagery is infra-red imagery from the geostationary MSG satellite.
- The rainfall image is derived from satellite data from MSG and rain-radar data. This represents a snapshot of instantaneous rain-rates at 0000 UTC and 1200 UTC and so does not necessarily reflect daily accumulations in the rainfall station map.
- Any analysis charts or satellite images which are unavailable will be displayed as white space.

Station maps

- The UK maps show station data for the same set of stations presented UK data table. These stations are selected to provide good spatial coverage across the UK; they represent only a fraction of the overall UK observing network.
- Wind speed maps show wind speed in Kt and direction both averaged over the hour up to the time of observation. 1 Kt = 1.151 mph.

Hourly station data

- The data tables provide spot hourly observations from synoptic messages at 0000 and 1200 UTC. Missing data are denoted by '-'.

- Pressures are mean sea level pressure in hPa.
- For UK stations, Gibraltar and Jersey, the wind speeds and directions are both averaged over the hour up to the time of observation. However, for European stations wind speeds and directions are both averaged over a 10-minute period up to the time of observation.
- Wind speeds are in Kt. Wind directions are stored in the database every 10 degrees and have been converted to the nearest point of the compass. These give the direction the wind is blowing from, not to.
- Cloud amounts are in Oktas from 0 (clear) to 8 (overcast). 9 indicates sky obscured (eg by fog).
- Air temperature and dew point temperature are in Celsius.

Temperature maps

- Daily maximum, minimum and grass minimum temperatures are in Celsius.
- The period for the daily maximum temperature is defined from 0900 UTC on the day in question to 0900 UTC the following day.
- The period for the daily minimum and grass minimum temperatures is defined as 0900 UTC the previous day to 0900 UTC on the day in question.
- On any given day the minimum will typically occur in the early hours of the morning and the maximum in early afternoon.

Rainfall, sunshine and max gust speed maps

- Daily rainfall is in mm from 0900 UTC on the day in question to 0900 UTC the following day.
- Daily sunshine is in hours from Kipp and Zonen CSD1 automatic sunshine records. Bright sunshine is defined as exceeding 120 W/m².
- Max gust speeds are the daily max gust in Kt from 0000-0000 UTC

Snow maps

- The day of snow falling map displays data from present weather sensors, showing stations which have recorded sleet or snow falling at any point in the day (0000-0000 UTC).
- The snow lying map shows level snow depth as recorded by the automatic snow depth sensors at 0900 UTC. These snow depth sensors do not record snow depth if this is less than 1cm.
- Snow depth sensors are normally operational from October to April, in the event of snow falling outside this period data availability may be limited.

- Snow maps will only be displayed if one or more of the selected stations on that date have recorded either snow falling or non-zero snow depths. If snow maps are not displayed it is still possible that other stations in the network have recorded a day of sleet or snow falling or non-zero snow depth.
