

THE DAILY WEATHER REPORT

BRITISH SECTION

1st April to 30th June

1932.

AIR MINISTRY. METEOROLOGICAL OFFICE, LONDON. W.C.2.

INTRODUCTION

The Daily Weather Report has been issued in three sections since April 1, 1919. The section of which this forms the Introduction is known as the "British Section."

NOTES REGARDING THE BRITISH SECTION.

Description of each issue:—The British section is issued daily by 12.30 p.m. (except that Sunday's issue is printed on Monday) and contains—

(a) On pp. 1 and 4 two tables of observations taken generally at 13h. and 18h. G.M.T. of "yesterday," and at 1h. and 7h. G.M.T. of "to-day" from about 45 stations in the British Isles, which regularly report to the Meteorological Office, and of the weather in the intervening intervals. These observations are telegraphed in a figure and letter code. The stations are arranged according to Forecast Districts as described at the foot of p. 2 of the report, and also on p. 4 of this Introduction. Whenever it is possible to do so without occupying too much space, the decoded values are set out in full in the table; in other cases, code figures are entered; these are interpreted by reference first to the number printed at the head of the column, and then to the Explanation printed at the foot of pp. 1 and 4, where the column numbers are shown in connexion with each of the separate classes of observation.

(b) Observations made at nine London Stations during the 24 hours ending 7h. or 9h.

(c) Table of atmospheric pollution for "yesterday" for South Kensington and Kew Observatory.

(d) Observations for "yesterday evening" and "this morning" from five capital cities on the Continent of Europe.

(e) On p. 2, a table of weather reports from British health resorts for the previous day, arranged under forecast districts.

(f) A weather chart (scale 1 : 10,000,000) for the British Isles and the neighbouring parts of the Continent and of the Atlantic. An explanation of the chart is printed below it.

(g) A "general inference" drawn up by the forecaster from all the weather charts available. This inference sets out the meteorological changes in progress and the deductions to be drawn from them.

(h) Weather forecasts for the 24 hours commencing 12 noon of the day of issue for 20 districts into which the British Isles are divided.

(i) A "further outlook," i.e. an indication of the changes to be expected after the expiry of the term of the forecasts, if the meteorological conditions are such as to warrant the issue of such an extension.

(j) On p. 3, a weather chart for the greater part of the Northern Hemisphere, including the whole of Europe, part of N. Africa, the Northern part of the N. Atlantic, N. America and usually a part of Russia in Asia.

The observations presented on this chart are not synchronous. Those for most of Europe (excluding Russia) and neighbouring countries refer to 7h. G.M.T., exceptions being:—Bulgaria (5h. G.M.T.) Austria, Hungary, Greece, Turkey, Egypt, Sudan, Cyprus, Palestine, Syria (6h. G.M.T.) Azores (8h. G.M.T.). The Greenland observations shown are made at 0h. G.M.T. with the exception of these for Mygbugten, which are for 7h. G.M.T., while those for North America are made at 1h. G.M.T.

In the case of ships at sea, the hour of observation for vessels east of 40° W. is 6h. G.M.T. while that for vessels west of 40° W. is 0h. G.M.T.

Thus, within each of the two sectors 40° W. to 170° W. and 30° E. to 40° W., the observations are approximately synchronous among themselves though most of those in the western sector refer to an epoch 6 hours earlier than do most of those in the eastern sector.

The observations shown for Russia and Siberia are especially to be noted from this standpoint of time. They are made at 7h. *local time* which implies that the absolute time to which they refer varies over a wide range, viz.: from 5h. G.M.T. in the longitude of Leningrad (35° E.) to 19h. G.M.T. of the *previous day* in longitude 180° E.

The map on the following page shows graphically the hours of observation over the various parts of the weather chart for the Northern Hemisphere.

Wind:—The force of the wind is indicated in each issue of the Report by figures on the Beaufort Scale. The equivalents between numbers of the Beaufort Scale and the indications of an anemometer when exposed at a height of 30 to 40 feet above the ground are set out at the foot of p. 2 of each issue. Stations where such anemometers are installed determine their Beaufort numbers from their anemometers by the use of this table. At stations where anemometers are not in use, the force of the wind is estimated by means of the specification set out below. All wind directions are "true" or geographical, as distinguished from "magnetic."

Gale warnings:—A note regarding the meaning of gale warnings and the method of indicating in the Report to what districts warnings may have been issued is also shown below.

THE INTERNATIONAL AND UPPER AIR SECTIONS.

The other two sections of the Daily Weather Report are Royal quarto in size.

The International Section contains 4 pp. per day and is issued daily by 3.30 p.m., but the issues for Saturday and Sunday are made on Monday. The "International Section" contains information received from the Continent of Europe, the Mediterranean Basin, Iceland and the Azores, and from ships on the Atlantic, arranged as follows:—

(a) Two weather maps (Scale 1 : 20,000,000) for Europe, the Mediterranean and Eastern Atlantic for 18h. yesterday and 7h. to-day.

(b) Two inset maps (Scale 1 : 20,000,000) for Northwest Europe for 13h. yesterday and 1h. to-day.

(c) Table of meteorological observations taken at about 80 stations, mostly on the Continent of Europe (not for the British Isles).

(d) Table of meteorological observations received by Wireless Telegraphy from Ships on the Northern Atlantic.

This section is very useful to one who wishes to trace the passage of various weather systems, since the 4 charts for each 24 hours enable the reader to follow the course of events in detail.

Upper Air Section:—The third section, called the "Upper Air Section" consists of 2 pp. Royal quarto per day and is issued in the same manner as the International Section. It contains maps, diagrams and tables showing upper air currents and upper air temperatures over the British Isles and on the Continent of Europe; and the cloud forms observed at different heights over the British Isles.

GALE WARNINGS.

The Meteorological Office issues warnings to ports and fishing stations of gales on or near the coasts of the British Isles. When one of these notices has been received at a station a black canvas cone is hoisted. The Signals remain hoisted after the receipt of a warning telegram until danger of a gale is passed.

The *North Cone* (point upwards) is hoisted for gales commencing from a Northerly point.

For gales commencing from East or West the North Cone will be hoisted if the gale is expected to change to a Northerly direction.

The *South Cone* (point downwards) is hoisted for gales commencing from a Southerly point. Such gales often veer, sometimes as far as Northwest.

For gales commencing from East or West the South Cone will be hoisted if the gale is expected to change to a Southerly direction.

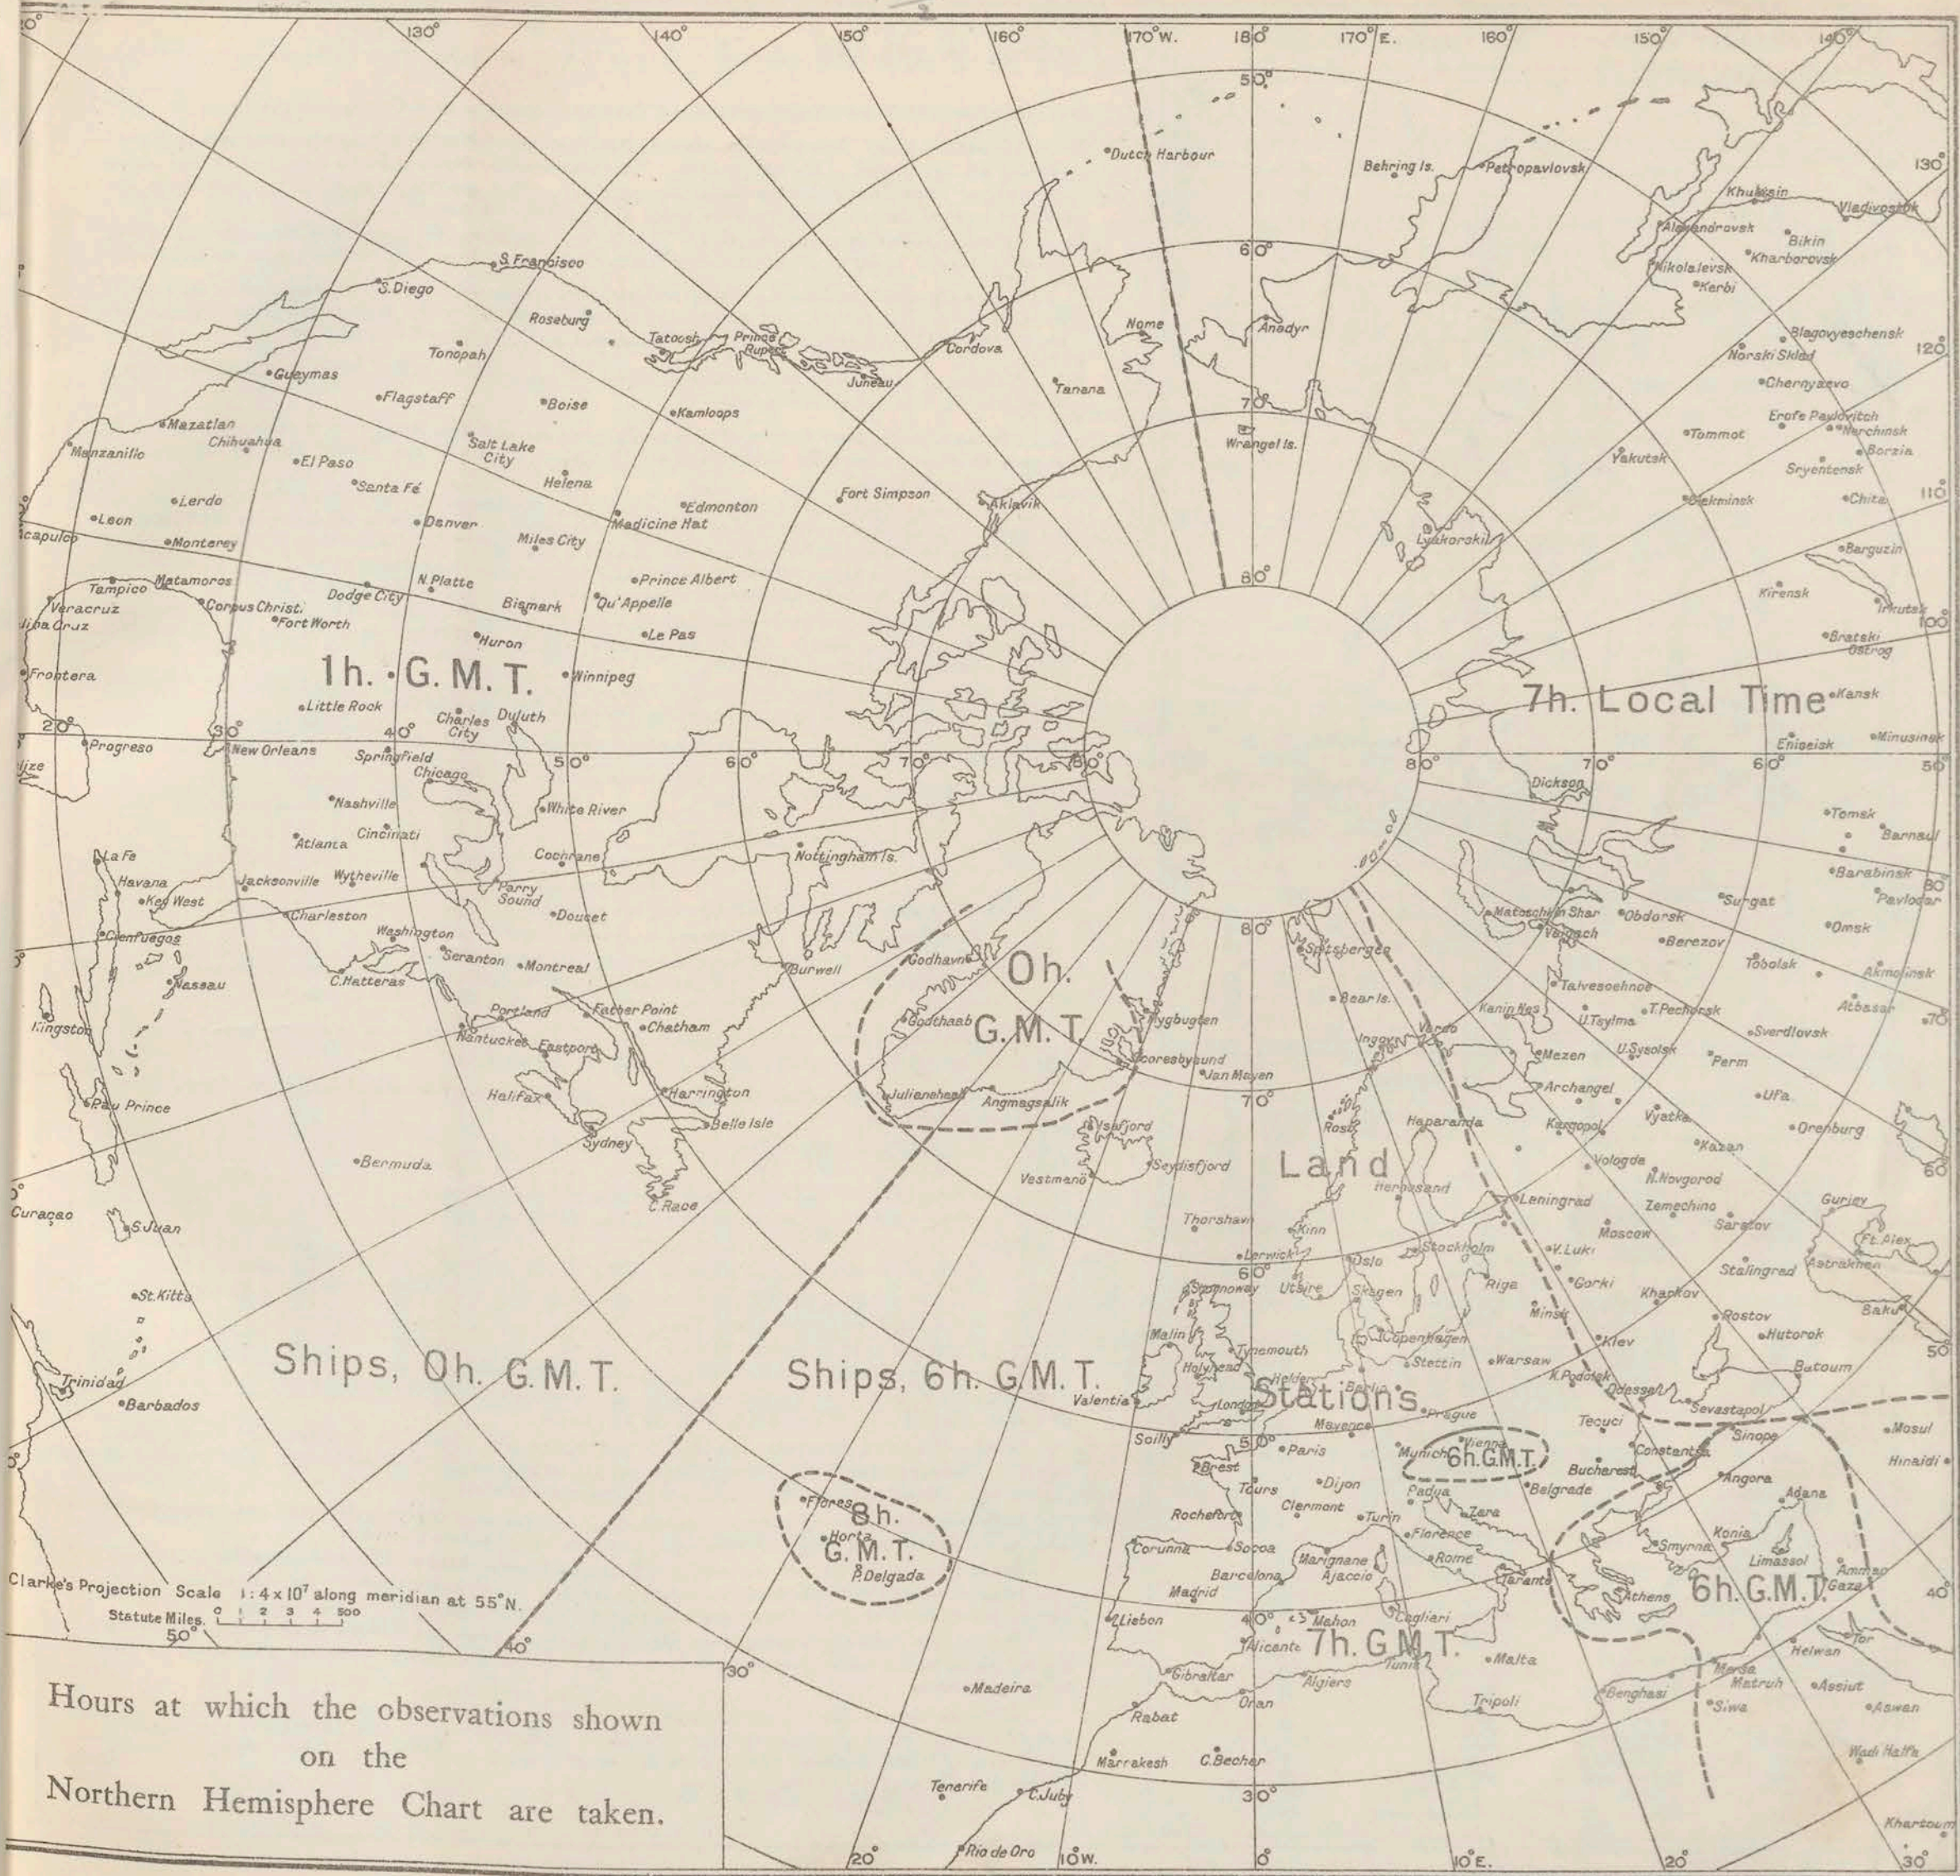

The districts to which warnings are sent are shown in the Report by the following symbols written on page 2 against the forecast districts to which they apply:—

▲ North Cone hoisted:

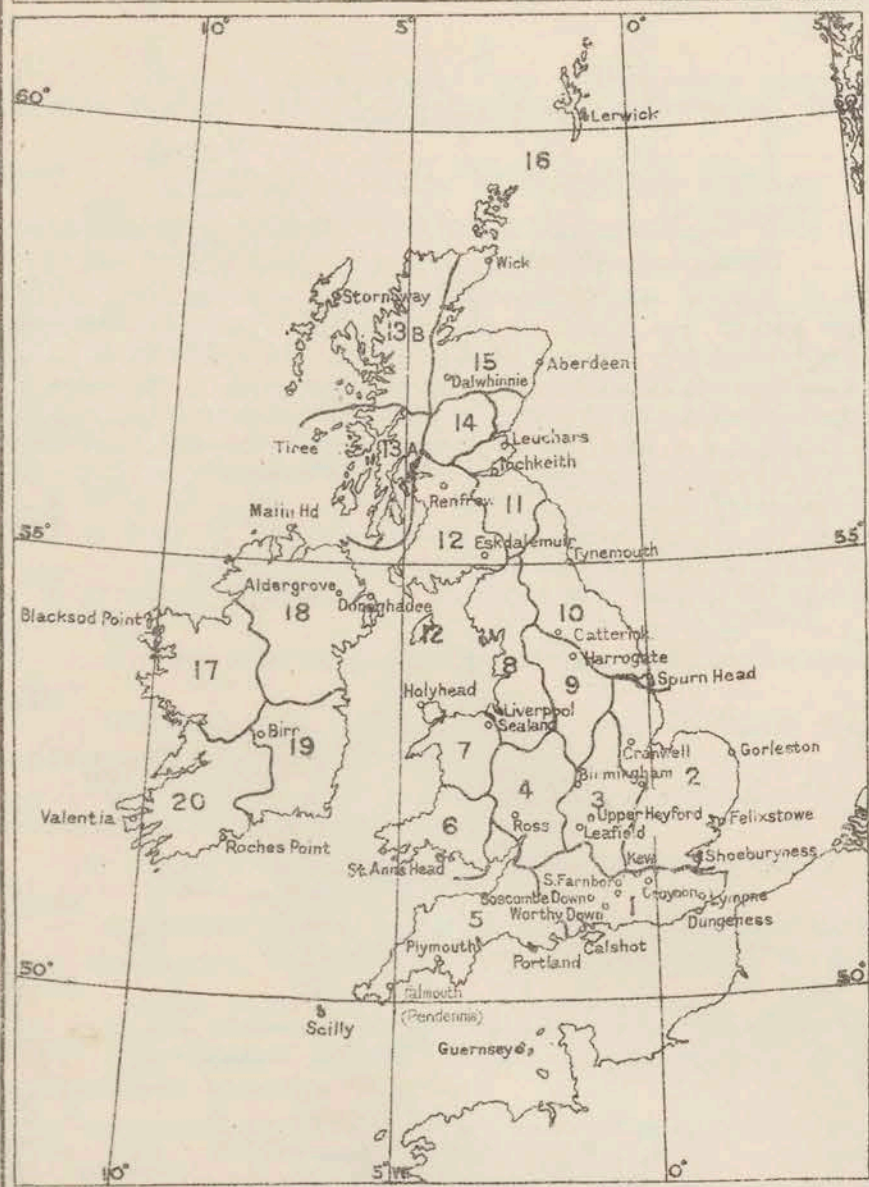

▼ South Cone hoisted:

The time or times of issue of the gale warning telegrams is shown below the further outlook" on page 2 of the Report.

NOTES ON THE INFORMATION CONTAINED IN THE DAILY WEATHER REPORT.

Standard of Time.—Greenwich Mean Time is exclusively used throughout the Report.

Stations.—*Kew.*—Temperature readings at Kew are taken in a large louvered screen placed against the north wall of the observatory. The thermometer bulbs are at a height of 10 feet above the ground immediately surrounding the building. This ground is raised a few feet above the general level of the Old Deer Park in which the observatory stands.

Valentia.—The observations at 1h. G.M.T. are taken at the Post Office Wireless Station on Valentia Island, those at all other hours at the Observatory near Cahirciveen on the mainland.

Falmouth and The Lizard.—Daily reports from Falmouth (Pendennis) ceased after 30th April. Reports from The Lizard, the prominent headland shown in the Map to the West of Falmouth, were arranged for in lieu of those from Falmouth, and commenced on 9th May.

Heights of Stations.—The heights of British Stations above M.S.L. refer to the plot of ground on which the rain gauge is situated.

Pressure.—The distribution of barometric pressure at Mean Sea Level is shown by means of isobars which are drawn for intervals of 2 millibars on page 2 of the Report and for intervals of 4 millibars on Page 3.

The wind at a height of 1,500-2,000 feet above ground usually blows along the isobars and, for the same temperature, pressure and latitude, the speed of the wind is inversely proportional to the distance between the isobars, e.g., for isobars 1 inch apart for the chart on Page 2 the speed of the upper wind is about 12 m.p.h. in latitude 55°, with a temperature of 50° F. and a pressure of 1,015 mb; if, however, the isobars are ½ inch apart the corresponding speed is 24 m.p.h.

The scale below can be used to determine the theoretical wind as deduced from the pressure distribution on either chart. On the assumption that the path of the air is straight this theoretical wind is called the Geostrophic Wind.

If the distance between consecutive isobars is measured along the scale from the left-hand extremity the geostrophic wind is shown by the scale in miles per hour.

GEOSTROPHIC WIND SCALE FOR

8 mb isobars on 1: 4 × 10⁷ Charts.
or 2 mb " " 1: 10⁷ " "

This scale applies under the following conditions:—

Pressure, 1,015 mb. Temperature, 50° F. Latitude, 55°.

Corrections.—For an increase of 10 mb pressure, subtract 1% from velocity; for an increase of 10° F. add 2%. From Latitude 55° to Latitude 65° subtract 1% for each degree above 55°. From Latitude 55° to Latitude 45° add 1½% for each degree below 55°.

Temperature.—Temperature is specified in degrees Fahrenheit, and is shown on the charts by means of figures written alongside the positions of the stations.

Relative Humidity.—Relative Humidity at British stations is calculated from the following hygrometric formulæ:—

$$\text{Relative humidity} = \frac{100x}{F}$$

$$x = f - .444 (t - t') \text{ for wet bulb readings above } 32^\circ \text{ F.}$$

$$x = f - .400 (t - t') \text{ for wet bulb readings below } 32^\circ \text{ F.}$$

where x is the vapour pressure in mb.:

f the saturation vapour pressure at the temperature of the dry bulb;

f' the saturation vapour pressure at the temperature of the wet bulb;

t the dry bulb temperature; and

t' the wet bulb temperature.

The values printed in columns 7 and 21 always end with the figure 5. By this it should be understood that a value of 95, for example, stands for any one of the values 90 to 100; a value of 85 stands for any one of the values 80 to 89 and so on.

Wind.—All wind directions specified in the reports are "true," as distinguished from "magnetic." The arrows indicating wind direction are drawn to fly with the wind. The number of feathers on the arrows denotes wind force by Beaufort number.

Adjusted Readings.—Where an instrumental reading is found to be in error and some adjustment is necessary, such adjusted reading is published in brackets thus (59).

The entries in the British Section of the Report for the stations in the main tables on pages 1 and 4 are compared with those in the returns received from the stations at the end of the month and errors in the Report so found are noted in the monthly correction sheets.

The reports from the London Stations on page 1 and from the Health Resorts on page 2 are not subjected to the same close scrutiny, but if any errors are found these are also noted in the correction sheets.

N.B.—Readers of the Report who are unacquainted with the method of construction and the use of weather charts are recommended to read "The Weather Map: An Introduction to Modern Meteorology," (2nd Edition, 1930), to be purchased from H.M. Stationery Office, Adastral House, Kingsway, W.C.2, price 5s. 2d. post free.

Notes on the Weather of the Month.

In striking contrast to May, June 1932 was unusually dry until the 27th and in some parts sunny. At Cheltenham there was an absolute drought of 29 days from May 30 to June 27 inclusive, and at Harrogate and Dunbar one of 28 days, from May 30 to June 26 and May 29 to June 25 respectively.

At first pressure was high over the Greenland - Iceland area and a depression on the Atlantic moved southeast to the Bay of Biscay causing heavy rain locally on the south coast of England on the 3rd. During the 24 hrs. ending on the morning of the 4th Portland Bill had 30 mm. and Eastbourne 25 mm. About the 4th polar air down the North Sea brought a spell of cold weather and on that day temperature failed to pass 50° at Lympne and 51°F. at Leafield and Plymouth. The Iceland anticyclone then moved southward and finally eastward and temperature gradually rose. Little rain fell except in W. and SW. Ireland on the 8th and 9th. By the 10th the anticyclone was centred over Germany and a shallow trough of low pressure crossed the British Isles. Thunderstorms occurred locally particularly on the 11th. Aberystwyth recorded 24 mm. of rain.

A new anticyclone SW. of Iceland on the 12th moved eastward and dominated conditions over the British Isles for some days. Subsequently the Azores high moved northeast and prolonged the spell of anticyclonic weather. On the 17th temperature was very high in Western Scotland and touched 80°F at Renfrew. Sunshine was abundant. About the 19th a low spreading westward from the Baltic caused an incursion of cold North Sea air and a spell of cool weather ensued particularly in Eastern districts. At Kew day temperature fell from 77°F on the 16th to 58°F. on the 20th. A little rain fell on the east coast but measurements were small.

From the 22nd depressions moved eastward across Iceland and temperature rose again while weather became more unsettled in Northern districts. The fair spell broke in England on the 27th. when a secondary trough to a deep depression near the Faeroes moved eastward. Heavy rain and local thunderstorms occurred round the 27th. and 28th. In 24 hours 34 mm. were measured at Morecambe, 27 mm. at Berwick-on-Tweed and 25 mm. at Wallasey. Temperature rose to 79°F. at many places in E. and SE. England on the 27th. Heavy rain fell in the SW. on the 29th. and spread to all districts on the 30th (55 mm. fell at Stoner Hill, Petersfield, in 24 hours).

** In extremes of rainfall the short period returns from Inchkeith are supplemented by those from Leith, and extremes of rainfall and sunshine from Calshot by those from Southampton.

† Based in part on reports made by telegraph in which the day and night measurements are rounded off to the nearest whole millimetre. Small discrepancies may arise between these totals and those given in the Monthly Weather Report which are based on readings taken to 0.1 mm.

Observations Coast Guard began Sept. 1930. Normals and extremes for old Station.

PRESSURE: ICELAND TO GULF OF LIONS

JUNE, 1932.

ISOPLETHS* BASED ON SIX-HOURLY OBSERVATIONS.

* The diagram is obtained by drawing a line from Akureyri in Iceland to the south of France near Marseilles. The points at which the isobars drawn for 4 mb. pressure intervals intersect this line at 1h., 7h., 13h., and 18h. are plotted consecutively and joined to show the variation of pressure from day to day at any point in the line. The line terminates at Lat. 66° N., Long. 18° W. in the north; at Lat. 44° N., Long. 4° E. in the south.

GENERAL INFERENCE.

Pressure is high to the north of the British Isles. There is a depression west of France and an extension of a depression centred over Germany is moving southwards over the southern North Sea and the Netherlands. Wind will be northerly or easterly and weather mainly fair in Scotland and Ireland but occasional drizzle or slight rain will occur locally in England. Temperature is unlikely to rise appreciably above the normal.

FURTHER OUTLOOK. for the season.

Probably little change in the general situation.

— Fog — Mist — Thunder. — Thunderstorm.
SEA DISTURBANCE. — Rough. — High.
BAROMETRIC CHANGE from 4h. to 7h. in tenths of millibars is entered beneath the temperature.

GENERAL INFERENCE.

Pressure is now highest in a belt which extends from north of the Azores to Faeroes to Northern Scandinavia. A depression centred over the Baltic Area is spreading west. Weather will be fair or fine generally, and warm or very warm by day except locally in northern and eastern coastal districts.

AIR MINISTRY, METEOROLOGICAL OFFICE.

7th SUNDAY, 19TH JUNE, 1932.

The map displays the following features:

- Pressure Systems:** A "HIGH" is located over Scandinavia, and a "LOW" is situated off the west coast of Ireland. Isobars are drawn at intervals of 2 units, ranging from 1018 down to 1016.
- Handwritten Annotations:**
 - "Barometer falling slowly" is written across the top right.
 - "Barometer rising slowly" is written across the middle left.
 - "Barometric changes slight" is written near the bottom center.
- Geographical Labels:** "LYRA", "KUNGSBOLM", "D. OF ATHOLL", and "ARIADNE" are labeled on the map.
- Data Points:** Numerous circular symbols containing numbers (e.g., 55°, 54°, 53°, 52°, 51°, 50°, 49°, 48°) are plotted across the map, representing specific meteorological observations or station data.
- Scale and Orientation:** A scale bar at the bottom indicates distances up to 300 statute miles. Latitude and longitude markings are present along the edges.

Scale 1:10,000,000

BAROMETER. Isobars are drawn for intervals of two millibars.
WIND. Arrows fly with wind. Number of feathers indicate Beaufort Force. Calm is indicated by circle outside weather symbol :—  **TEMPERATURE** is given in degrees.
WEATHER SYMBOLS :—  Clear sky.  Sky less than $\frac{1}{10}$ clouded.  Sky $\frac{1}{10}$ to $\frac{3}{10}$ clouded.  Sky $\frac{3}{10}$ to $\frac{5}{10}$ clouded.  Overcast sky.  Rain falling. * Snow. * Sleet.  Fog.  Mist. T Thunder.  Thunderstorm.
SEA DISTURBANCE.  Rough.  High.
BAROMETRIC CHANGE from 4h. to 7h. in tenths of millibars is entered beneath the temperature.

An anticyclone centred between Scotland and Iceland is decreasing in intensity while a belt of low pressure connects depressions over the Baltic and Spain. In eastern districts weather will be rather cool and mainly fair apart from occasional coastal showers. Elsewhere conditions will continue fair with moderate or rather warm day temperature.

Probably similar.
