Daily Weather Summaries for July 2021

If you have any questions or feedback about this product or wish to obtain further data please contact the Met Office.

This document contains daily weather summaries for each day of July 2021. The Met Office National Meteorological Library and Archive holds a continuous record of daily weather summaries or daily weather reports from 1860, and these daily weather summaries form a continuation of that series.

The purpose of each summary is to provide an overview of the weather conditions across the UK on that day, with the historical emphasis mainly based on observations from surface network of weather stations, although the format has varied over the decades. While the emphasis remains on observations from the surface network, the current daily weather summaries supplement these by including satellite and rain-radar imagery to provide a more complete overview. The current format of the daily weather summaries is as follows:

1. Text summary of the main characteristics of the weather during the day, written by an operational meteorologist in the Met Office operations centre.
2. Table of daily extremes for the UK for key climate variables including temperature, rainfall, sunshine and gust speeds.
3. Overview of the synoptic situation at 00 and 12 UTC comprising: analysis charts showing the surface pressure pattern and associated weather fronts; North Atlantic and European infra-red satellite images showing cloud-cover; combined infra-red and rain-radar images of the UK; maps of wind speed and direction at 00 and 12 UTC; observations of pressure, wind speed and direction, cloud cover, air and dewpoint temperature at selected UK and European stations in data tables.
4. UK maps of key climate variables from observing stations including maximum, minimum and grass minimum temperature, rainfall, sunshine, gust speed and snow.
5. Further guidance notes

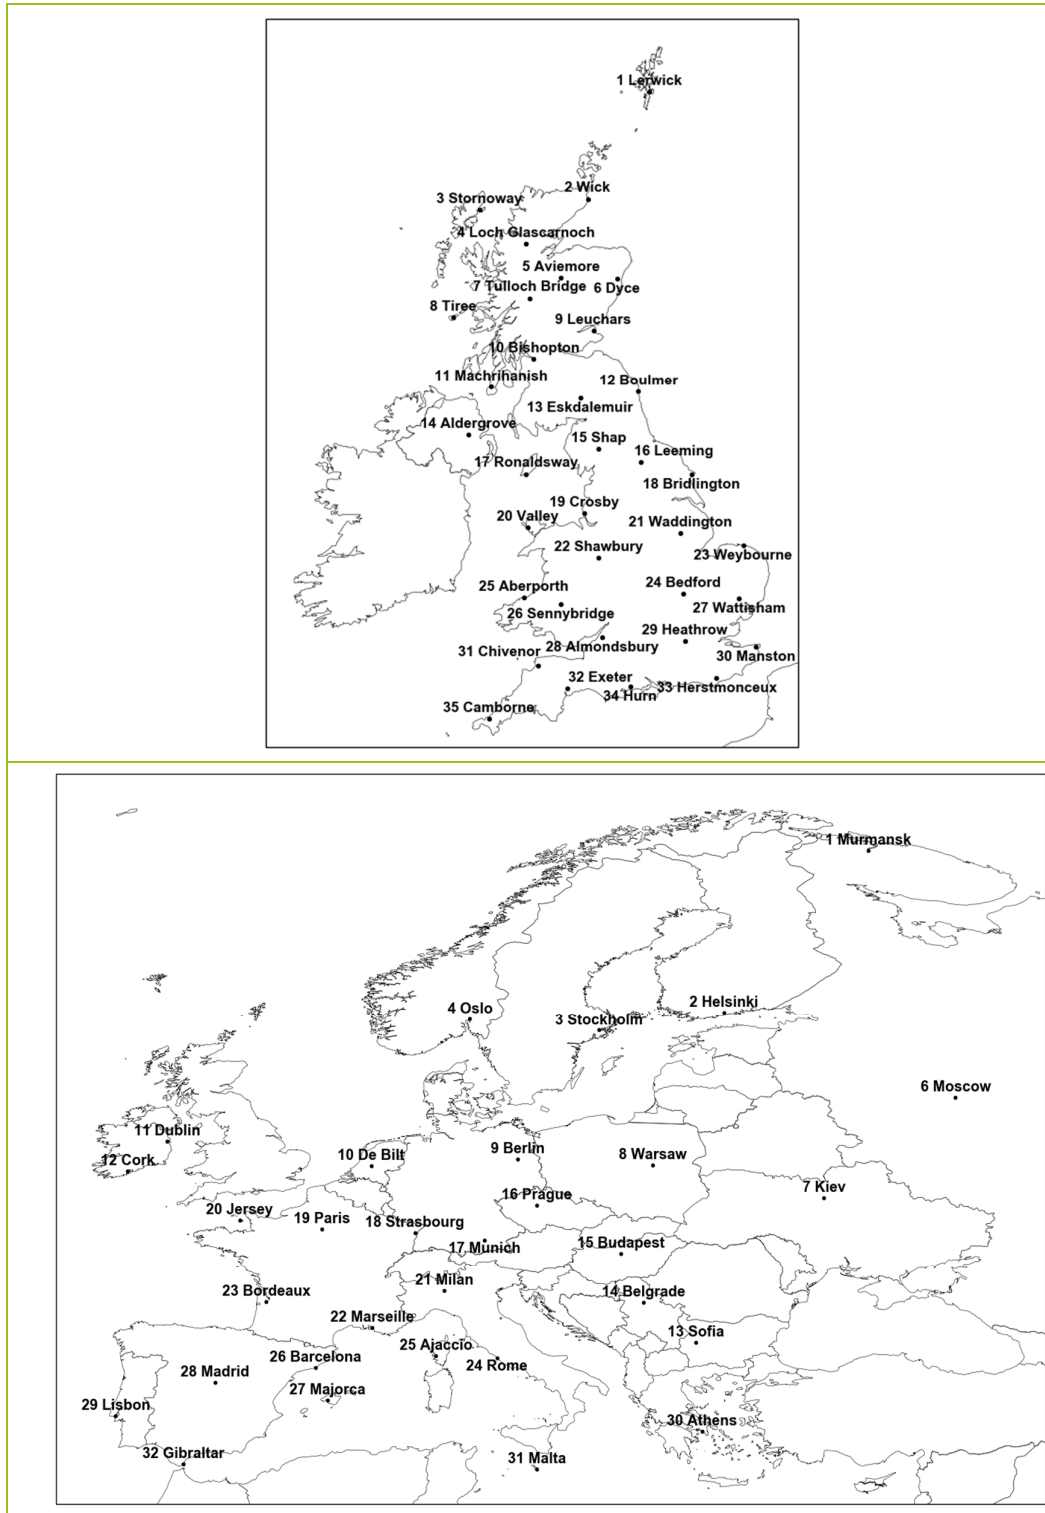

If you spot any data errors or omissions in this product please contact the Met Office.

Daily Weather Summary for Thursday 01 July 2021

This day's summary created 08/07/2021 03:03

Summary of the UK Weather for Thursday 01 July 2021

During the early hours it was largely dry across the UK due to influence from high pressure. North Scotland, south Wales and most of southern England saw some clear spells, but elsewhere cloud, mostly stratus, blanketed the country. Winds were light throughout, which allowed for some low cloud and fog patches to form mainly along the coast of Wales and the southwest along with areas along the east coast. Through the morning cloud across parts of southern Scotland, Wales and northern and central England gradually thinned and broke in places allowing for some brighter spells. Elsewhere there was plenty of sunny spells, however some low cloud persisted in coastal areas in the west and east. Through the afternoon showers developed across the far south into the far southeast, producing some localised heavy rain. Into the evening and early night, variable amounts of passing cloud and clear spells occurred with low cloud and fog patches becoming more extensive in the west of Wales and the southwest. Some more extensive cloud occurred over Southern Scotland giving some outbreaks of rain.

Summary of the UK Weather for Friday 02 July 2021

Through the early hours clear spells occurred towards the southwest and the far north of the UK, with variable cloud amounts through northern, central and eastern areas of England, along with southern Scotland. Some outbreaks of rain broke out over southern Scotland and into northern England with some patches of rain along the eastern coast. Low cloud and fog patches were observed near the coasts in the south. A cold night rurally in Scotland. Friday morning started largely dry across the UK, but with some rain around the English, Scottish border. This area of cloud and rain gradually broke to scattered heavy showers through the day. A band of cloud across northwest England and northern Wales, thinned through the day, with widely sunny spells through afternoon, along with a few daytime showers in inland areas. Meanwhile, an area of cloud approached from the southwest, which by mid-afternoon had reached central Wales and the southeast coast of England bringing outbreaks of rain to the far southwest. This rain spread further northeast, with heavier outbreaks over parts of southwest UK by midnight.

Summary of the UK Weather for Saturday 03 July 2021

An unsettled day throughout. During the early hours cloud with outbreaks of rain, at times heavy, spread from the southwest over the southern half of the UK. Further north, an area of cloud brought outbreaks of rain to northern parts of Scotland as it gradually progressed north. It was mostly cloudy but dry over Northern England and into southern Scotland. Saturday morning started cloudy across the UK with organised, heavy and persistent rain spreading across Wales, central and northern England and Northern Ireland. Moving into the afternoon, this band of rain approached the north of the UK with northern England and Scotland affected by some torrential downpours which were accompanied by thunder and lightning, easing through the evening. In the Southwest, Midlands, and Wales, a mixture of sunny spells and scattered showers developed in the early morning. These showers moved generally northeast, growing heavier with a few lightning strikes. During the late afternoon they gathered into an organised band, increasing in intensity to become torrential downpours in places, with many lightning strikes. Warm and humid overall.

Summary of the UK Weather for Sunday 04 July 2021

Sunday started with three areas of rainfall across the UK. In north and central Scotland, organised rain was easing and moving north. In south Scotland and north England, heavy rain and thunderstorms quickly dispersed, ending by sunrise. In Wales and the Southwest there was a band of rain, often heavy but gradually easing. East England was largely clear and dry, though cloud built from the south, and Northern Ireland was unsettled, with scattered showers. As the morning progressed, a variety of cloud layers were situated over the majority of the UK. Early showery rain across the southwest continued to spread eastwards over Wales, south England and the Midlands. Meanwhile, scattered showers were spotted in other parts of the country with the heaviest over Northern Ireland, north-western England and Scotland. Moving into the afternoon, outbreaks of showery rain became more extensive and occurred over most of the country, with some localised heavy bursts, thunder and lightning strikes, especially over east England. Into the evening and early night, thundery showers became less frequent for many areas and were confined over the north.

Summary of the UK Weather for Monday 05 July 2021

A wet start to Monday for many in the UK, with showery rain covering large portions of England, eastern Wales, south and central Scotland, and Northern Ireland. This rain was heavy in places, with occasional thunder and lightning. The rain moved largely northeast, clearing the southwest by morning but lingering over much the rest of the UK. Rain persisted across parts of Scotland throughout the day. Southern areas began bright and dry before cloud spilled in from the southwest. This was caused by an area of low pressure pushing in from the Atlantic, bringing a persistent and heavy rain with it. Winds increased along the south of England, with gales developing along coasts later. The low pressure system brought rain to Wales and the Midlands during the evening, as it moved along its track across the UK.

Summary of the UK Weather for Tuesday 06 July 2021

During the early hours, a slowly weakening cyclonic feature over the southwest of the UK gradually progressed north, bringing clouds and outbreaks of showery rain over central England and later onto north England. Further north, scattered showers, occasionally heavy, spotted over north Scotland whilst elsewhere remained dry and mostly cloudy. As the night progressed and rain approached northern England, showers occurred across the southwest of England, whilst clear spells developed over eastern parts of England. It was a windy night for southern areas with coastal gales. Into the morning, many areas saw showery outbreaks of rain, and a larger area of rain brought persistent downpours into northern England and eastern Scotland. Conversely, the west of Scotland remained largely dry and fine throughout the day. Winds were strong along areas in the south and east of the UK and a lightning strike was recorded in the south of England during the late afternoon. Into the evening, showers and longer spells of rain continued to break out for many as the depression affecting the UK lingered in the North Sea.

Summary of the UK Weather for Wednesday 07 July 2021

Wednesday started with a band of showery rain traversing England, moving eastwards and affecting most places. Meanwhile, northern England, Northern Ireland, and southern Scotland remained dry with variable cloud. During the early hours, spells of rain fell over northern Scotland, whilst the rain over England turned more showery in nature, turning heavy in places. Lightning strikes were recorded over south Wales. The cloud covering much of the UK broke up through the morning and was replaced by puffy cumulus clouds and sunny spells. The showers over England and Wales intensified and became aligned in bands, roughly southwest to northeast. Around midday, some of these became thundery, especially over the East Midlands, but also across the Borders. Eastern and central Scotland remained cloudier and received some showers. Northern Ireland and southeastern England stayed largely dry. Winds were generally weak, but strong gusts affected southern and southeastern coastal areas. The showers started to clear during the evening, but some lasted across eastern areas and the Midlands, and some continued producing lightning.

Summary of the UK Weather for Thursday 08 July 2021

Many areas were dry through the early hours of Thursday with occasional clear spells. There were just a few outbreaks of light rain and drizzle across southern and northwestern parts of the country. Visibility was also poor across some of these areas due to low cloud and patches of mist and fog. There were a few sunny spells over eastern Scotland in the morning, but otherwise Scotland and Northern Ireland experienced cloudy skies through the day. Further south, Wales and northern England had largely clear skies to start the morning while mid-level cloud covered the south. By midday, patchy convective cloud had developed over much of England and Wales and showers affected many areas through the afternoon. The heaviest of which affected East Anglia and the south of England. The showers over England eased through the evening and a few developed over the Grampians. Other areas of the UK were mostly dry, with some clear spells.

Summary of the UK Weather for Friday 09 July 2021

Showers persisted through the early hours across western parts of the UK and east and northeast Scotland. Elsewhere was dry and mostly cloudy, although there were clear skies over some areas in the southern half of the country. Parts of central and eastern England were warm and humid. After an initially dry start across the UK, showers developed over northeastern England and eastern Scotland through the morning. Southwest England and Wales also saw showers forming by midday, with further showers across southeast England and East Anglia. Despite dry conditions elsewhere, it remained cloudy throughout, with only some sunny spells in central and southern parts where breaks in the cloud allowed. Several funnel clouds were recorded across northeast England, from Lincolnshire to as far north as County Durham. Deep convection led to some torrential outbreaks of rain in Norwich and other parts of East Anglia, with some thunderstorms developing towards the evening. Into the night, showers eased for most, with notable exception to eastern Scotland where these persisted. An occlusion approaching southwest England brought rain to Cornwall and Devon by midnight.

Summary of the UK Weather for Saturday 10 July 2021

Most of the UK was blanketed in low cloud through the early hours of Saturday, with only northern Scotland and the Borders experiencing a few clear spells. An area of rain slowly spread westwards across southern England and South Wales, and a few showery outbreaks fell over the Highlands, northern England and the East Midlands. Winds were light and fog was reported at many locations along the east of the country. Through the morning, rain continued westwards along southern stretches of England, lingering in the southeast for a time, before clearing easternmost areas in the early afternoon. Some scattered showers affected northern stretches of England and Wales, but cleared later in the day. Excluding southern areas, most saw dry but cloudy conditions through the day, with notable exception to northern Scotland, which saw persistent rain. In the evening, further showers developed across northern England, and along southwestern coasts of England and Wales. These were generally light and fleeting. Into the night, rain continued in northern Scotland, with the odd shower elsewhere but conditions remained generally dry throughout.

Summary of the UK Weather for Sunday 11 July 2021

Many areas stayed dry overnight, and central and southern England received the longest clear spells. Outbreaks of rain fell over a cloudy Scotland and a little pocket of heavy rain tracked northwards up western England. A band of thick cloud and rain gradually pushed northeastwards into the Southwest, Wales and Northern Ireland. North Sea coastal areas experienced foggy condition through the early hours and some fog patches formed across southern England around dawn, aided by light winds. Into the day an area of low pressure began to move eastwards over the south of England, and with it bands of rain pivoted around extending rainfall to over Wales, and central and southern England. This affected western areas in the day, but reached over into the east overnight. Lightning strikes were frequently recorded over Cornwall and then parts of northern Scotland later. Showers were also frequent up in Scotland and Northern Ireland, and it was generally a very cloudy day for most.

This day's summary created 23/07/2021 15:41

Summary of the UK Weather for Monday 12 July 2021

The early hours of Monday were cloudy for all and rain affected most parts of England; heaviest in the north at first, then strengthening farther south around dawn with some particularly heavy downfalls seen in Dorset. Scotland, Northern Ireland, and Wales received fewer outbreaks of rain, which had mostly cleared by dawn. Fog was reported at some coastal areas in northern Scotland and Northern Isles. Southwestern coasts were breezy, but winds were light elsewhere. Into the day, the showers held back for a time in the morning, though parts of northern England and southern Scotland continued to see some light rainfall. However, into the afternoon some showers, thundery in places, began to develop across Wales and England, with some particularly strong thundery showers in the southeast leading to flash floods. Into the evening, this began to slowly decay along with cloud, allowing for some clear spells to develop, though in the southeast the rain was slower to clear than elsewhere leading to further heavy showers into the later hours.

Summary of the UK Weather for Tuesday 13 July 2021

The night commenced with a veil of cloud across much of the UK, with clear spells in the breaks between. Isolated showers continued across southern stretches of the Pennines, and through eastern and southeastern England. These were largely light, and relatively fleeting in nature. The west of the UK saw driest and clearest conditions. It was a mild night for most. Through the morning showers drifted southwards over central England, the south, and Wales. Elsewhere saw some cloud cover with a good deal of sunny spells too. This largely continued throughout the afternoon with some showers also breaking out over northern and central Scotland. The sunniest conditions were found over the southwest and parts of Wales. Late into the evening these remaining showers eased to become generally clear and dry, with low cloud for some, especially around eastern coastlines.

Summary of the UK Weather for Wednesday 14 July 2021

The day began dry and with clear skies across central parts of the UK, though some sea fret from the North Sea gave some low cloud and fog along the north eastern coasts and the odd bit of drizzle. Low cloud and fog also affected Northern Ireland and some western coastal areas ahead of an occlusion. The morning was fine and dry for much of the UK with plenty of lengthy sunny spells across the country, although some areas along the east coast remained fairly grey with the cloud from earlier lingering. Cloud also moved over the very north of Scotland, accompanied by a few showers. Settled conditions continued through the afternoon with showers clearing over northern Scotland and some sunny spells developing too. Through the evening, low cloud moved in from the northwest to cover much of Scotland, parts of Wales, and northern England. This brought with it some drizzly patches, mainly concentrated over western Scotland. Despite this it remained mild.

Summary of the UK Weather for Thursday 15 July 2021

The day began calm and settled, with clear skies across the majority of the UK. However, Northern Ireland, north Wales, the west coast of Scotland and the north west of England saw some low cloud approach from the west, and with it the odd bit of drizzle. As the morning progressed, cloud began to lift and clear southeastwards across the country, with western parts seeing largely clear skies by midday; the exception being Northern Ireland, which saw lingering low cloud. It was a dry day for most, with only some very patchy drizzle across western parts at times during the day. Through the afternoon, cloud continued to clear, leaving clear skies for most by the evening; only northern and western Scotland, and Northern Ireland, saw persisting cloud cover. It was a warm day across the country, with light winds for all, and the highest temperatures occurred for western parts.

Summary of the UK Weather for Friday 16 July 2021

Friday continued to be fine and settled, much like the last few days, with the majority of the UK dry under clear skies through the early hours. The exception to this was cloud seen over northern Scotland together with isolated drizzly patches, and also some low cloud seen for a time over East Anglia and Kent. It was a fairly mild night for most. As the morning progressed, low cloud over East Anglia cleared away, leaving largely clear skies and plenty of sunny spells across most of England and Wales; western Scotland, and parts of Northern Ireland, remained under low cloud for much of the day. Into the afternoon, most saw clear skies and patchy fair-weather cloud, with plenty of sunshine. These clear skies, and light winds, allowed for a very warm day, hot in places.

Summary of the UK Weather for Saturday 17 July 2021

It was a fine start to Saturday with the whole of the UK seeing settled conditions. Most of the country was under clear skies with the odd bit of low cloud in places, and some more extensive cloud over central Scotland associated with an occlusion. It was a mild night across the country. Saturday morning started fine and dry with plenty of lengthy sunny spells across most of the country. Cloud covered much of Scotland with showers and drizzle occurring over the northwest, with the far north seeing the heaviest of it. During the afternoon and under strong sunshine and blue skies, temperatures increased, with most of the country seeing very warm and, in a few places, hot conditions. Cloudier conditions continued over Scotland through the evening, accompanied by drizzle and cooler temperatures. Light winds occurred over most areas, but with the far north seeing some strong gales.

Summary of the UK Weather for Sunday 18 July 2021

It was a benign start to the day for much of the country, with widespread clear skies and light winds. The exception to this was Scotland, which saw a band of cloud slowly moving southwards across it through the early hours, with associated patchy light rain and drizzle across its northernmost parts; Northern Ireland also had some low cloud, to a lesser extent. It was another mild night for all, and quite warm in places. Sunday morning started with a high-pressure system lying across the UK, bringing settled and widely warm weather. Early morning mist cleared away with blue skies and sunshine to follow across the country. Meanwhile, clouds occurred over the far northern and western areas of Scotland, accompanied by light showers and drizzle. Through the afternoon, settled conditions continued with lengthy sunny spells for most of the country, allowing the temperature to increase to very warm and for some southern places hot. Into the evening, Scotland remained covered with cloud layers along with drizzle and cooler temperatures.

Daily Weather Summary for Monday 19 July 2021

This day's summary created 27/07/2021 13:30

Summary of the UK Weather for Monday 19 July 2021

The day began with clear skies across much of the country, except for a band of cloud, and some patchy light rain and drizzle, across much of Scotland and Northern Ireland, and fog near eastern coasts. This cloud progressed slowly southeastwards through the early hours, affecting some northeastern coasts of England. It was a warm night, especially in the south, with light winds. Generally, a cloud-free day followed for most as the early morning cloud and fog quickly faded away, bar some lingering stratus lying over northern Scotland, and mostly fair-weather cloud bubbling up elsewhere inland through the day. However, some cloud bubbled up so intently, in fact, it brewed a storm from Kent to East Sussex, producing some lightning and localised heavy downpours. As the intensity of the sun diminished into the evening, the storm died out over the Channel. It was a very warm or hot day for many, with little respite from light winds. Overnight, the low cloud in the far north continued to linger, and mist and fog developed under the clear skies elsewhere. With the high day time temperatures, the night was oppressively muggy for many too.

Summary of the UK Weather for Tuesday 20 July 2021

It was a fine start to Tuesday with the whole of the UK seeing settled conditions. Most of the country was under clear skies with the odd bit of low cloud and fog in places, and some more extensive cloud over Scotland, which was slowly moving southwards through the early hours; Northern Ireland also had some low cloud, to a lesser extent. It was a warm night for most places. The day carried on in much the same manner as the morning: clear skies as the low cloud and fog burnt away by dawn. It was a hot and sunny day for many, and the heat encouraged some cloud to bubble up. While most clouds remained in their benign and fluffy fair-weather state, some grew and gained enough energy to bring lightning and heavy downpours, particularly where they became slow moving in the light winds. The thunderstorm focus in the afternoon to evening was across the east Midlands, although some broke out elsewhere across the east and southeast of England and a few also affected Wales. Through the evening, the heavy showers and thunderstorms slowly faded away. A clear, dry and warm night followed, except for low cloud and hill fog over northeast England and the north and east of Scotland.

Summary of the UK Weather for Wednesday 21 July 2021

Wednesday continued to be fine and settled, with widespread clear skies and light winds. The exception to this was northeastern parts of England and most areas in Scotland, which saw a band of low cloud and fog patches slowly moving westwards across it through the early hours, with associated drizzly patches. Low clouds were also spotted across Northern Ireland. It was a warm night for most places. As high pressure continued to dominate across the UK, many places experienced a dry day with hot temperatures and plenty of sunshine. During the afternoon, isolated showers with some thunder affected Northern Ireland, the northwest of the UK and parts of East Anglia. These showers quickly faded away by evening to leave a dry and clear night with high temperatures for many.

Summary of the UK Weather for Thursday 22 July 2021

The winds were light through the small hours, with southern and western areas seeing largely clear skies. However, low cloud and fog rolled in along the eastern coasts, and further fog developed into central parts, as well as Liverpool Bay and northern Scotland. Far southwest Cornwall saw cloud and a little bit of light rain, but overall, it was a dry, uncomfortably warm night, with a few places on western coasts not dropping below 20 C making it a tropical night. It was another fine and dry day for many as high pressure continued to dominate across the UK. Isolated showers developed during late afternoon in the Midlands, northwest England and the far west of Wales. Some of these turned heavy with thundery downpours. These showers soon ease by evening to leave a dry night for most with some patchy high cloud in places.

Summary of the UK Weather for Friday 23 July 2021

The dominance of the heatwave-causing high pressure over the UK began to wane through the small hours. Through the cloudy morning, most of the winds were light which allowed pocket of fog and mist to form. Low stratus and a little bit of light drizzle rolled inland from the North Sea to stretch from east to central UK, with just the southeastern quadrant seeing clearer skies. Higher, broken cloud covered the western half and offered some beautiful sunrises. Friday was pleasant for many areas. Cirrus and Altocumulus Castellanus spread in from the south through the day giving some interesting skies, with some low cloud affecting the West Midlands in the morning. A more extensive area of low cloud had spread quite a way inland off the North Sea, and only slowly burned back to the coast. Unseasonably strong winds affected the winds South Coast and gradually moved inland later. Thunderstorms moved northwards from the Channel through the afternoon and reached the southern coast of England during the evening. Elsewhere stayed dry into the evening with clear spells in the west.

This day's summary created 31/07/2021 03:04

Summary of the UK Weather for Saturday 24 July 2021

It was an unsettled start for the southern half of the UK as a band of heavy rain gradually edged northwards throughout the early hours. Heavy downpours turned thundery at times and were accompanied by gusty winds, with parts of Dorset and Hampshire seeing the heaviest bursts. By dawn, a further organised band of heavy thundery showers from south Wales to Kent slowly moved northwards. Elsewhere, it remained dry with the clearest skies further north, another mild night for many. Through the morning low cloud covered southern and eastern parts, with coastal mist and fog patches. The band of thunderstorms gradually eased throughout the morning. Low cloud burnt back towards the east coast leaving sunny, dry and warm conditions across much of Scotland and Northern Ireland. Further south it stayed generally cloudy with occasional outbreaks of rain and thundery showers along southern coasts. Into the evening, low cloud moved back into eastern areas, bringing some fog and drizzle to some coastal areas. Showers headed northwards off the south coast, continuing throughout the evening. Elsewhere it stayed dry with clear spells.

Summary of the UK Weather for Sunday 25 July 2021

Sunday began cloudy for many areas, with some clear spells, particularly across Scotland and northern England where it remained dry. During the early hours, there were some heavy showers in England, especially over Devon, these gradually eased. By dawn, some sporadic outbreaks of light rain affected some southern and central areas of England, with heavier rain approaching the south coast. Low cloud moved into the east coast and it was a mild night for many. Through the morning cloud thinned across much of Scotland along with parts of northwest England, with lengthy sunny spells developing. Further south it remained largely cloudy with some brighter spells towards the west. Into midday showers started to become heavy and thundery towards the southeast especially over parts of London, Essex and Kent. Showers locally heavy and thundery continued through the afternoon and into evening over the far southeast of the UK. Further north and west, sunny spells continued with lengthy clear spells into the night. However, cloud remained in the southeast and central areas with low cloud increasing along the east coast.

Summary of the UK Weather for Monday 26 July 2021

It was mostly dry with variable amounts of cloud across the UK through the early hours. However, some showers lingered in the far southeast with outbreaks of cloud and rain moving into Orkney overnight. Low cloud and fog formed along the Western Isles along with some patches over East Anglia. It was a cool night where clear spells formed in northern England and western Scotland. Elsewhere it was milder and stayed cloudier. Through the day a front progressed gradually eastwards, producing cloud over Northern Ireland and western Scotland with some patchy outbreaks of rain later. Variable cloud amounts and sunny spells occurred over northeastern areas, and outbreaks of rain continued over Orkney and Shetland. Further south, sunny spells occurred over Wales and western England, with cloud and a few showers occurring towards the southeast. Through afternoon, heavy daytime showers occurred over central and eastern Scotland with a few showers forming over south Wales and southwest England. During evening, cloud spread into western areas followed by outbreaks of rain, locally heavy, with clearer spells occurring over central and eastern areas.

This day's summary created 03/08/2021 11:53

Summary of the UK Weather for Tuesday 27 July 2021

Outbreaks of rain across Northern Ireland and the Hebrides. Showers in Aberdeenshire eased through the early hours. Mixture of heavy thundery showers and light rain spread eastwards across southern England and Wales. It was cloudy for most, though Scotland and northern England saw some early clear spells. The Northern Isles experienced fog. Low pressure dominated much of the weather over the UK today, bringing widespread showers to the south of the country from early morning. These showers progressed northwards during the day through the Midlands, and into the north of England and Scotland into late afternoon, with further showers developing in the south. Some of these showers were locally heavy and thundery, continuing through afternoon and into evening. Amidst the showers, some sunny spells occurred. Feeling cooler and fresher in some areas compared to recent weeks. During the evening, some clear spells developed towards the far south, with a few showers persisting. Heavy showers remained in central and northern England into Scotland, some thundery.

Summary of the UK Weather for Wednesday 28 July 2021

During the early hours, a front progressed eastwards over western areas, bringing cloud and outbreaks of rain from north Wales northwards, and across Scotland. In front of this some heavy showers, at times thundery continued over central and eastern Scotland associated with a trough. Further south over most of central and southern England it was mostly cloudy with limited clear spells and some passing showers. Later in the night an area of cloud and rain advanced eastwards into Northern Ireland. Showery conditions dominated across the UK through Wednesday. Scotland and North East England experienced frequent showers merging to longer spells of rain through the day, locally heavy, leading to large rainfall totals. Showers readily developed through the morning across most of England and Wales, becoming heavy and thundery in places. Northern Ireland experienced continued heavy showers. Further south showers were more localised with lengthier sunny spells through afternoon, however rather blustery, particularly at coastal locations. Cloud thinned in the Midlands and the south into the evening, with a few scattered showers and plenty of clear spells. Feeling cool and fresh.

Summary of the UK Weather for Thursday 29 July 2021

Outbreaks of rain, at times heavy continued over parts of Scotland through the early hours whilst spreading southwards into Northern Ireland. Cloud occurred widely across the north of the UK with showery areas of rain in parts of northern England and north Wales. Further south, it was largely dry with clear spells, although some isolated showers fed eastwards into South West England. Clouds rolled in from the east to cover southwest England and Wales, followed by a heavy band of rain as Storm Evert approached. Elsewhere, there were patches of rain over the north of Scotland and northwest England. The rain from the southwest continued into the evening spreading north eastwards across the Midlands and into parts of northern England. Severe gales were reported along the southwest of England and Wales and the Isles of Scilly. Further north, the early evening showers dissipated. A cooler day for most.

Summary of the UK Weather for Friday 30 July 2021

Named Storm Evert, the first storm to be named this summer, dominated the weather picture in the UK from the early hours of this morning. It tracked northeastwards towards the UK, making landfall in southwest England, bringing strong winds, notably across Cornwall. Rain accompanied these blustery conditions, with the heaviest rainfall experienced along southern coasts of Wales. Persistent showers also affected southwest coasts of England, some locally heavy and thundery in places. The storm continued tracking northwards in the early hours. Elsewhere, conditions remained relatively dry and clear, with some isolated showers in northern Scotland. Storm Evert continued to track across central England through the day, bringing further heavy rain and showers to affected areas. There were a few thunderstorms in the East Midlands, particularly Lincolnshire. Southwest England saw the most sunshine, with Scotland and Northern Ireland having a mainly cloudy day with some light showers. It was a windy day throughout much of England and remained cool throughout. Through the evening, the precipitation continued to pull away to the east, with a few showers affecting southern and western areas.

Summary of the UK Weather for Saturday 31 July 2021

A drier start to Saturday night as the low pressure system associated with storm Evert moved eastward away from the mainland. Showers overall eased into the early morning despite some localised outbreaks. A band of showery rain moved southwards across east Scotland into northeast England and some residual showers across north Wales and the southwest continued. It generally remained cloudy across the UK throughout the early morning with light winds. Temperatures were cooler than yesterday morning. Earlier showers from northeast England persisted throughout the day, becoming heavier towards the later evening near the coast. Additional showers across the east, southwest, and southern England were widespread and patchy though sometimes heavy. Thundery showers occurred in the southeast around mid-afternoon, bringing some lightning. These daytime showers eased throughout the evening for most of the country with the exception of northeast England. Cloud covered most of the UK throughout the whole day, which thickened into the evening, bringing patchy light rain to the West Midlands. Low cloud in parts of southern Scotland, northeast and southwest England gradually eased in later.

Daily Weather Summary for Saturday 31 July 2021

Daily Weather Summary for Saturday 31 July 2021

None of the selected stations observed a day of sleet or snow falling or non-zero snow depth at 0900 UTC.

Guidance Notes

UTC = Universal Coordinated Time. For the UK UTC is the same as GMT (Greenwich Mean Time).

National boundaries shown on the European station map are for illustrative purposes only.

Daily extremes

- Daily extremes have been manually confirmed by Met Office Observations Quality Management as valid observations from the live database at the time of checking. However, more extreme values may still be possible if they occur after the time of production.
- Mountain stations above 500 masl are excluded from lowest temperatures, highest gust speeds and greatest snow depths at 0900 UTC. This is because they are not considered representative of low level areas.
- Counties quoted against each station are based on historical county boundaries pre-1974 and may not reflect current administrative boundaries.

Analysis charts and satellite imagery

- The satellite imagery is infra-red imagery from the geostationary MSG satellite.
- The rainfall image is derived from satellite data from MSG and rain-radar data. This represents a snapshot of instantaneous rain-rates at 0000 UTC and 1200 UTC and so does not necessarily reflect daily accumulations in the rainfall station map.
- Any analysis charts or satellite images which are unavailable will be displayed as white space.

Station maps

- The UK maps show station data for the same set of stations presented UK data table. These stations are selected to provide good spatial coverage across the UK; they represent only a fraction of the overall UK observing network.
- Wind speed maps show wind speed in Kt and direction both averaged over the hour up to the time of observation. 1 Kt = 1.151 mph.

Hourly station data

- The data tables provide spot hourly observations from synoptic messages at 0000 and 1200 UTC. Missing data are denoted by '-'.

- Pressures are mean sea level pressure in hPa.
- For UK stations, Gibraltar and Jersey, the wind speeds and directions are both averaged over the hour up to the time of observation. However, for European stations wind speeds and directions are both averaged over a 10-minute period up to the time of observation.
- Wind speeds are in Kt. Wind directions are stored in the database every 10 degrees and have been converted to the nearest point of the compass. These give the direction the wind is blowing from, not to.
- Cloud amounts are in Oktas from 0 (clear) to 8 (overcast). 9 indicates sky obscured (eg by fog).
- Air temperature and dew point temperature are in Celsius.

Temperature maps

- Daily maximum, minimum and grass minimum temperatures are in Celsius.
- The period for the daily maximum temperature on day D is defined from 0900 UTC day D to 0900 UTC day D+1.
- The period for the daily minimum and grass minimum temperatures on day D is defined as 0900 UTC day D-1 to 0900 UTC day D.
- On any given day D the minimum will typically occur in the early hours of the morning and the maximum in early afternoon.

Rainfall, sunshine and max gust speed maps

- Daily rainfall is in mm from 0900 UTC day D to 0900 UTC day D+1.
- Daily sunshine is in hours from Kipp and Zonen CSD1 automatic sunshine records. Bright sunshine is defined as exceeding 120 W/m².
- Max gust speeds are the daily max gust in Kt from 0000-0000 UTC

Snow maps

- The day of snow falling map displays data from present weather sensors, showing stations which have recorded sleet or snow falling at any point in the day (0000-0000 UTC).
- The snow lying map shows level snow depth as recorded by the automatic snow depth sensors at 0900 UTC. These snow depth sensors do not record snow depth if this is less than 1 cm.
- Snow depth sensors are normally operational from October to April, in the event of snow falling outside this period data availability may be limited.
- Snow maps will only be displayed if one or more of the selected stations on that date have recorded either snow falling or non-zero snow depths. If snow maps are not

displayed it is still possible that other stations in the network have recorded a day of sleet or snow falling or non-zero snow depth.
