## Daily Weather Summaries for January 2021

**If you have any questions or feedback about this product or wish to obtain further data please contact the Met Office.**

This document contains daily weather summaries for each day of January 2021. The Met Office National Meteorological Library and Archive holds a continuous record of daily weather summaries or daily weather reports from 1860, and these daily weather summaries form a continuation of that series.

The purpose of each summary is to provide an overview of the weather conditions across the UK on that day, with the historical emphasis mainly based on observations from surface network of weather stations, although the format has varied over the decades. While the emphasis remains on observations from the surface network, the current daily weather summaries supplement these by including satellite and rain-radar imagery to provide a more complete overview. The current format of the daily weather summaries is as follows:

1. Text summary of the main characteristics of the weather during the day, written by an operational meteorologist in the Met Office operations centre.
2. Table of daily extremes for the UK for key climate variables including temperature, rainfall, sunshine and gust speeds.
3. Overview of the synoptic situation at 00 and 12 UTC comprising: analysis charts showing the surface pressure pattern and associated weather fronts; North Atlantic and European infra-red satellite images showing cloud-cover; combined infra-red and rain-radar images of the UK; maps of wind speed and direction at 00 and 12 UTC; observations of pressure, wind speed and direction, cloud cover, air and dewpoint temperature at selected UK and European stations in data tables.
4. UK maps of key climate variables from observing stations including maximum, minimum and grass minimum temperature, rainfall, sunshine, gust speed and snow.
5. Further guidance notes

If you spot any data errors or omissions in this product please contact the Met Office.

## Daily Weather Summary for Friday 01 January 2021

This day's summary created 08/01/2021 03:00

### Summary of the UK Weather for Friday 01 January 2021

During the night, a band of cloud edged its way southwards across northern England, bringing some outbreaks of rain and sleet. There were some light scattered showers in northern Scotland, Northern Ireland, North Wales and over the West Midlands. Elsewhere across the UK it was a dry night with clear spells allowing for widespread fog patches, with freezing fog, some ice and a locally severe frost forming across the south of England. New Year's Day saw cloud and patchy rain, with some sleet move south across England and Wales, with frost and fog only slowly lifting. Wintry showers affected northern Scotland and Northern Ireland. Although most of the UK was covered with clouds, there were intermittent breaks of sunny spells especially for western areas. There were clear spells and a few wintry showers across northern and western areas during the evening, whilst further south it was cloudier with further patchy rain and local sleet. Some ice developed on the roads and pavements. A frost soon returned in the clearer areas.

### Summary of the UK Weather for Saturday 02 January 2021

The night was clear and dry for most of the UK. There was a band of cloud over the south, with precipitation in the southeast, which eased as the night progressed. There was also scattered precipitation in the north of Scotland, where it often fell as snow, and Northern Ireland, both of which moved southeast, spreading to south Scotland and western Wales. Generally cold, with overnight frost and patches of freezing fog. Into the daytime the showers over Scotland and Wales began to develop further, becoming more widespread as they spread southwards - giving showers over most of Wales in the morning that spread into the south west during the afternoon as well as more scattered showers in the north of England and southern Scotland. Some of these fell as snow, particularly over Wales and northern England. Then into the daytime showers began to dissipate, though some more organised showers of snow and sleet continued to fall across southern Wales and the West Midlands. Towards the later hours, some scattered showers began to approach the eastern coast, moving southwest. Skies were generally clear away from any showers, with the south west being an exception with cloudy skies through the day. Light winds generally across the UK. Another cold day, with temperatures remaining below average.

This day's summary created 10/01/2021 03:00

### Summary of the UK Weather for Sunday 03 January 2021

During the night, thick clouds covered most of the UK with wintry showers over eastern areas. The heaviest and most persistent rain occurred over northeastern England and Scotland, falling as sleet or snow in places. Elsewhere it was generally dry with the clearest skies across Northern Ireland and western Scotland. As the night progressed, wind started to build as the western coast experienced the strongest gusts. It was a cold start to the morning with frost in places. Rain moved west across the country as the day went on, becoming more showery as it did so, but remaining wintry over hills. By late afternoon only westernmost areas of the UK, and Northern Ireland, were unaffected by these showers, remaining largely dry until midnight. Overall it was rather breezy across much of the UK, more so along the Channel Coast, which also experienced the strongest gusts. Cloud lingered throughout much of the day, which, combined with the brisk winds and low temperatures, made it quite a cold and grey day for most.

### Summary of the UK Weather for Monday 04 January 2021

Showers affected eastern parts of the UK from midnight through to dawn, wintry over the high ground of northern England and the Scotland hills. A large area of rain also made its way into the southeast. Conversely, western parts of the UK were mostly dry through the night. Strong easterly winds affected coastal areas of England and Wales. It was a cold night and some areas in northern Scotland experienced freezing fog. The showers continued to affect eastern areas during the day and moved further inland into southern Scotland and northern England. The area of persistent rain stayed over the Southeast and spread along the southern counties during the afternoon, before it turned to showers in the evening. During the morning, freezing rain was reported in the Clyde Valley and fog affected coastal Moray. Western Scotland and Northern Ireland were initially sunny, but patchy cloud moved in from the rest of the UK later. It remained windy along the Welsh and English coasts and became windy inland after midday. The showers continued into the night while western areas stayed dry.

## Daily Weather Summary for Tuesday 05 January 2021

This day's summary created 15/01/2021 13:14

### Summary of the UK Weather for Tuesday 05 January 2021

The day began with showers, which were wintry at times to lower levels, moving into the east of the UK. Some of these showers penetrated inland, affecting some western areas, such as northwest England. Southeast England saw the most organised and persistent rainfall. It was a breezy night for much of the country, with little cloud, and the strongest gusts along the south coast. It was cold overnight. High pressure sat to the northwest of the UK, generating northeasterly winds, which continued to feed showers into the east of the UK through the day. These turned wintry over the hills of northern England. The heaviest of any showers occurred over the southeast, while more scattered showers affected eastern Scotland and, at times, the southwest. The showers continued into the night and remained heaviest in the east. Cold daytime temperatures meant that these showers caused icy conditions in eastern areas. Cloud cover was patchy, with western areas and Northern Ireland seeing some bright spells. Brisk winds through the day gave a wind chill.

### Summary of the UK Weather for Wednesday 06 January 2021

Eastern areas and the south coast received showers from midnight onwards, and an area of more persistent rain stayed over the southeast. Western Scotland and Northern Ireland had largely clear skies, while the rest of the UK received patchy cloud cover. Strong easterly winds affected southern coastal areas. It was a cold night, especially in northern Scotland. Icy conditions formed in the east and a few locations in Scotland reported freezing fog during the early hours. A band of cloud pushed into northwestern Scotland around dawn. During the morning, wintry showers tracked westwards to the southeast of England, and the Midlands. Snow was recorded in elevated southeastern parts, and further west along the south of England, as far as Gloucestershire. Through the afternoon, much of the UK remained dry, though a few showers remained around Wales, northeast England, and southern coasts. However, a front from the northwest reached Scotland by dusk, bringing with it rain, sleet, and snow; this progressed over Northern Ireland into the night. Much of the UK saw freezing fog patches and widespread frosts develop overnight.

### Summary of the UK Weather for Thursday 07 January 2021

Thursday began with some significant precipitation over Scotland and Northern Ireland, which lingered through into the morning. This often turned wintry, with freezing rain and snow being reported in many locations. Away from any precipitation there was minimal cloud coverage, with most places seeing clear skies and only small amounts of patchy cloud in the south east. Winds were light. Temperatures remained colder than average. Fog lingered around the West Midlands, Cotswolds, and Wiltshire. With light or calm winds, most of it remained into the evening. Freezing fog was reported in the northeast, and rime near Birmingham. A clear winter's day in the far southwest, southeast, and east England, remaining so into the evening as outbreaks of rain, sleet, and snow continued to affect other parts of England and Wales, whilst northern Scotland and Northern Ireland saw snow showers.

### Summary of the UK Weather for Friday 08 January 2021

The night started with outbreak of wintry precipitation across much of the UK, falling predominantly as rain in the south. Clearer skies occurred over much of Northern Ireland, northern and central Scotland, and parts of the southeast. Significant snowfall accumulations were reported in the northeast. Widespread frosts, and icy conditions, developed across much of the UK, with freezing fog patches, primarily in central and northern areas. Through the day the wintry showers slowly continued southwest into the northwest and then north Midlands and north Wales, slowly weakening and becoming patchy with accumulations mainly on higher ground. Heaviest precipitation lingered in the northeast where further snowfall occurred. Behind this feature skies cleared, with clearer skies also occurring in the southeast. Central and western areas stayed largely cloudy throughout the day. Central Scotland and the southeast remained the driest. Although a few outbreaks of rain later pushed into the far southeast during the afternoon. During the evening the feature bringing snow to north England lingered as winds converged. This brought increasing accumulations with reports of 15 to 25 cm in places.

This day's summary created 16/01/2021 03:00

### Summary of the UK Weather for Saturday 09 January 2021

During the early hours Northern Ireland and northern England saw clear skies, with low cloud and freezing fog over the UK; the densest across East Anglia. Some of this fog lingered through the day. The tail-end of a warm front swept over Scotland bringing clouds, and light rain as dawn approached. Whilst a few light wintry showers occurred in the southeast. Light winds for most of the UK, but north Scotland saw stronger gusts. Widespread low temperatures overnight. During morning cloud thickened over Scotland, spreading into Northern Ireland and northern England with outbreaks of rain and milder temperatures over west Scotland. Isolated rain showers occurred over the Dover straight, with some reaching the Kentish coast. In the afternoon, rain fell more heavily over western Scotland and spread over much of Scotland, with also the odd shower over northern England and Northern Ireland. During the evening the front bringing rain to Scotland spread south into northern England. Across much of central England and Wales it remained dry and clear with fog patches.

This day's summary created 17/01/2021 03:00

### Summary of the UK Weather for Sunday 10 January 2021

During the early hours parts of Wales, central England, and southern England saw a mixture of clear spells, low level cloud, and fog. Further north, across northern England, southern Scotland, and Northern Ireland cloud spread southwards, with a cold front producing outbreaks of rain and mountain snow. Behind this, frequent showers fed into the north of Scotland and across Shetland, wintry in nature with hill snow. Winds were generally light across the UK but somewhat blustery in the exposed far north. Further outbreaks of rain and drizzle affected northwest Scotland which slowly moved eastwards throughout the day, becoming more persistent and heavy. It turned milder here compared to the rest of the UK where it remained cold, particularly in the southeast where freezing fog was slow to lift during the day. Elsewhere, it was a largely dry but cloudy day with just a few patches of light rain affecting Northern Ireland and northeast England. Winds remained generally lighter in the south but strengthened somewhat in the north.

This day's summary created 20/01/2021 08:32

### Summary of the UK Weather for Monday 11 January 2021

Monday started off with widespread cloud cover across the UK with occasional clear spells confined to the south coast of England. There was rain over western Scotland, and scattered light showers over both Northern Ireland and the southwest of England. This rain continued through the early hours with further light showers breaking out over the north of England. It was a milder night than of late with temperatures largely staying above zero. Most of the UK saw light to heavy precipitation during the day, rain in most places but snow in northern Scotland. The precipitation in Scotland headed south and east, while the rain in north England developed and spread, producing heavy rain in north and central England and much of Wales. Northern Ireland also saw heavy rain coming in from the Atlantic. The southwest continued to see patchy drizzle and the east and south coasts remained largely dry. This rain continued moving south overnight, with Scotland and northeast England seeing some sleet and snow, especially in the hills.

This day's summary created 19/01/2021 03:00

### Summary of the UK Weather for Tuesday 12 January 2021

A wet start to Tuesday with several weather fronts bringing outbreaks of rain and drizzle across much of England, Wales and Northern Ireland into the early hours. Temperatures remained mild under the cloud cover but windy, especially along the coasts. Further north, a cold front tracked southwards overnight which gave way to clear skies across Scotland and later for northern England and Northern Ireland, producing cold conditions with ice patches. Sunrise saw ice in parts of Northern Ireland, Scotland and northern England whilst the rest of the country experienced milder weather conditions, especially in the south. It remained generally dry during the morning with scattered showers across Wales and the southern parts of England. The afternoon became drier, sunnier and cold across northern and central parts of the UK this afternoon. Outbreaks of rain remained across South Wales and southwest England through the afternoon. A cold and frosty night across northern and eastern parts of the UK under clear skies. Much of southwest England and South Wales had a mild, cloudy night with outbreaks of rain.

## Daily Weather Summary for Tuesday 12 January 2021

## Daily Weather Summary for Wednesday 13 January 2021

This day's summary created 20/01/2021 03:00

### Summary of the UK Weather for Wednesday 13 January 2021

Wednesday started dry and fine for most, but with rain, often heavy, over Northern Ireland, most of Wales and far-west Scotland. The rain moved south and east through the early hours of the day, reaching parts of northwest, central and southern England by sunrise. Some fell as sleet and snow in Scotland, particularly on high ground. Dry areas of Wales and the southwest saw patchy fog. The day then saw the precipitation continue to migrate north eastwards, covering most of Scotland as well as north and eastern England. This frequently fell as wintry precipitation (snow, sleet, freezing rain) over Scotland and North east England, with the worst of any snow being on any hills. Low cloud and fog often sat on the western side of the band of precipitation, meaning parts of central England frequently saw fog through the day. Elsewhere was mostly dry and clear, though southwest England and Northern Ireland saw cloudy skies. Into the night precipitation, wintry at times over Scotland and northern England, continued and began to pivot and extend its reach to over Wales, most of eastern England, and parts of the south west. Elsewhere remained cloudy. The UK continued to be split temperature wise, with north areas remaining cold and southern areas remaining mild.

### Summary of the UK Weather for Thursday 14 January 2021

It was a wet, cold start to the day for most of UK with parts of Scotland and northern England covered with snow, especially in the east and over hills. Meanwhile a band of rain, heavy at times, pushed southeastwards over the country, heaviest in the east. As the night progressed, it passed over most of the UK, with wintry precipitation mainly over northern parts. Much of southwest England had a mild night under cloud cover. Western coasts also saw strong winds. As the day progressed, the band of rain that covered much of the eastern UK continued moving eastwards, heavy and wintry in places and only clearing the country late in the evening. Eastern Scotland and England saw rain throughout the day, with Northern Ireland being showery throughout. Western parts remained largely dry through afternoon, apart from the odd patchy shower. Wind speeds remained average for most, with western coasts seeing moderately strong gusts. It was quite a cold day in eastern parts, especially over any snow, while remaining quite mild in southern and western areas, and Northern Ireland.

This day's summary created 22/01/2021 03:00

### Summary of the UK Weather for Friday 15 January 2021

Friday started out dry across much of the UK, with a few remaining showers over eastern Scotland and south Wales quickly clearing. Low cloud and fog sat over the eastern coast, with freezing fog and fog patches being frequently recorded along eastern and central England, as well as over Northern Ireland where some thicker cloud began to move in from the west. Elsewhere saw patchy cloud cover. Cold, with the southwest remaining milder than the rest of the UK. During the day, most areas stayed dry, with only a few showers along the southeast coast of England. A veil of high level cloud thickened from the west, though it was bright at times. A band of rain moved eastwards into Northern Ireland in the afternoon and spread into Scotland, Wales and western England during the night. Only central and eastern England remained dry. Strong winds affected Northern Ireland and western Scotland, strengthened elsewhere as the rain moved in. Fog persisted throughout the day in Yorkshire, which kept temperatures close to or below freezing.

This day's summary created 29/01/2021 15:55

### Summary of the UK Weather for Saturday 16 January 2021

It was a wet, cloudy, start for western parts, as a band of precipitation moved overhead, bringing heavy downpours over western coasts of England, Wales, and Scotland. This slowly moved eastwards, having cleared Northern Ireland, leaving patchy showers in its wake. It was accompanied by strong winds along the Irish Sea and Scottish coasts. It was quite a cold night ahead of this precipitation, becoming warmer after its passing. During a morning, this band of precipitation reached southeastern UK and brought accumulations of sleet and snow across parts of London and East Anglia before eventually clearing in the early afternoon. Brighter conditions followed across southwestern UK, while showers fed into northwestern areas through the morning and afternoon, these wintry over the hills. It was also rather windy across these parts, particularly along coastal areas. Showers continued across northwestern UK during the evening, leaving some sleet and snow over high ground. Eastern areas were rather cold, particularly during the morning, whereas southwestern parts were milder than usual.

### Summary of the UK Weather for Sunday 17 January 2021

Brisk northwesterly winds brought a steady stream of showers into northern and western Scotland and Northern Ireland throughout the night. At midnight, a cluster of showers were positioned over northwest England and northern Wales. These tracked southeast across the Midlands and fizzled out over southeastern UK before dawn. Cloud covered much of the mainland initially, but this too cleared to the southeast, leaving clear spells in its wake. A few patches of fog formed in northern England. The morning began with scattered showers across Northern Ireland, western Scotland, and northwest England. By midday, widespread rain from the Atlantic reached northwestern Scotland, bringing extensive heavy downpours, notably in central and southern areas. Through the afternoon, the rain tracked further south, bringing substantial outbreaks of rain to northwest England. The remainder of the UK remained largely dry, besides Northern Ireland, where the showers were persistent. Into the night, outbreaks of rain also affected parts of Wales. A strong breeze could be felt throughout the UK, with northern Scotland seeing coastal gales.

This day's summary created 29/01/2021 15:55

### Summary of the UK Weather for Monday 18 January 2021

Rumbles of thunder were recorded around midnight in the northern Highlands as showers drifted southwards across northern parts of the UK, these falling as sleet and snow over high ground. Southern areas were largely dry, barring some scattered showers across Wales and the South West. The night was largely cloudy, although there were some clear spells over parts of northeastern Scotland, the Midlands, and over parts of southern England where some patches of mist and fog formed. The rest of the day continued to be cloudy, with an infrequent chance of clear skies for some. Showers continued and more popped up around the UK; lingering rain around Leeds saw around 30mm of rainfall. While the day started calm for most, the winds gradually picked up, with near gales along west and southwest coasts, as Storm Christoph approached. The showers continued throughout the evening, with parts of northern Wales and northern England seeing the heaviest and most persistent rain. The temperature sank over northern and central Scotland and a frost occurred.

### Summary of the UK Weather for Tuesday 19 January 2021

The night commenced with a warm front associated with 'Storm Christoph', bringing rain, often heavy across western parts and spreading across the majority of England, posing a flood risk. Cloud covered the majority of the UK with only northern and central Scotland witnessing largely clear skies. It was a mild night in the south but rather cold in the north. Further south it turned slightly drier but remained windy, with coastal gales. Cloud increased into central Scotland through the morning, staying dry, showers confined to the far north. Heavy rain continued through the day across north Wales and northern England with occasional outbreaks of lighter rain in the south. The late afternoon and through evening more heavy rain pushed eastwards across Wales and England, while the first front persisted in the north, heaviest and most persistent in the west. Across southern Scotland rain slowly transitioned into snow especially over high ground. Whilst over the rest of Scotland along with Northern Ireland it remained largely dry with frequent wintry showers on the north coast.

### Summary of the UK Weather for Wednesday 20 January 2021

Outbreaks of rain occurred widely over England and Wales associated with Storm Christoph, with the most heavy and continuous rain in the west over north Wales and northern England. Northern Ireland and Scotland remained predominately dry and bright, but the Scottish borders and showers over northeastern Scotland. Rain continued through the morning and into the afternoon with the associated feature slowly pivoting over the UK, producing high rainfall accumulations leading to flooding in parts. Across Scotland it was largely drier, although with heavy showers from the northeast. Through the later part of the afternoon as the front pivoted showers from the north continued over Northern Ireland and later into west Wales with temperatures dropping steeply in the colder air mass. Winds were strong, particularly around coasts. Later in the evening the rain slowly moved east-northeastwards which drew in colder air from the north allowing for precipitation to turn increasingly to snow over northern England and across Scotland. Colder clearer conditions with scattered showers occurred over Northern Ireland and into the west.

### Summary of the UK Weather for Thursday 21 January 2021

Thursday began with cloud and rain sweeping northeastwards over the UK, positioned over central, eastern and northern areas at midnight. Areas across Scotland, northern and central England experienced snow at times. Blustery showers formed over Northern Ireland, northern Scotland, and Wales causing ice in places. Elsewhere clearer spells developed. Rain cleared the east later, however, sleet and snow lingered over northeast England, and Scotland. Daytime itself saw a mixture of sunny spells and showers, with these showers mainly confined to southwestern England, western Wales, northwestern England, and Northern Ireland. Northwestern England saw the heaviest of these showers, wintry at times. Frontal bands associated with Storm Christoph continued to affect northeastern areas with heavy rain and snow gradually easing into rain showers by the evening. During the afternoon, it turned cloudier over southern England with coastal rain. This cleared by evening with the majority experiencing clear spells excluding some wintry showers over western areas. It was a cold day with strong winds throughout, especially in the northeast from Storm Christoph.

### Summary of the UK Weather for Friday 22 January 2021

Friday started largely clear and dry excluding a few snow or sleet showers over southwestern England, northern England, Northern Ireland, and the Inner Hebrides and for the continued influence of storm Christoph bringing thick cloud cover over most of Scotland, and snow over northeastern Scotland. The morning saw widespread frosts alongside icy stretches. Winds were strong along northeastern coasts but light elsewhere. As the day continued, the showers in Scotland, north England and Northern Ireland continued, becoming heavy and even thunderous at times. In the southwest the showers spread, producing a mix of rain and wintry hazards, including hail. They spread north and east, covering large parts of Wales and the West Midlands, and were heavy at times, particularly in the mid-afternoon, producing some thunderstorms. Through the late evening the storms began slowly clearing, leaving freezing fog and ice in places.

### Summary of the UK Weather for Saturday 23 January 2021

The early hours were cold for much of the U.K. on Saturday with largely clear skies that allowed for a widespread frost to develop and some freezing fog patches. However, a band of rain, sleet and snow moved across central England and into East Anglia, clearing by dawn. Further west scattered showers affected north Wales, Northern Ireland northwest England, and the north and west of Scotland. Elsewhere it remained largely dry with cloud building in the south. It was a very cold Saturday morning across the country with mist, fog patches and showers feeding through the Irish Sea. Wintry showers affected northern and western Scotland, parts of the midlands, Wales, and south-east England. There was plenty of sunshine through the afternoon, especially for south Wales and southwestern England but it remained cold and icy in places. Sleet and snow showers continued during the evening in east and southeast England with a few persisting in north Wales and the midlands creating some patches of ice. Elsewhere dry, clear and cold with frost forming. Wintry showers remained in north and west Scotland.

## Daily Weather Summary for Sunday 24 January 2021

This day's summary created 31/01/2021 03:00

### Summary of the UK Weather for Sunday 24 January 2021

Sunday started with a large band of precipitation over the southern region of Northern Ireland, stretching down to the west coast of Wales and southwest England, becoming sleet and snow as it moved inland. Wintry showers scattered across Scotland, particularly near the coasts. The rest of the country was dry and largely clear. Into the morning the band of precipitation continued further inland, rotating anticlockwise through the day until the band began to sit horizontally over central England. This precipitation often fell as snow and sleet, with central and south east England seeing most of the snowfall. Following this band of rain were showers, which mostly affected Wales and southwest England, these also fell as snow over any high ground. Showers also began to approach the northern coast of Scotland into the afternoon. Cloud was mostly isolated to areas of precipitation and ahead of the band of rain, meaning that the day started out cloudy for most of England but into the afternoon most places saw some periods of clearer spells including Scotland, Wales, and Northern Ireland. Fog was also commonly reported ahead of the band of the rain. Into the night the band of rain and any showers then began to move southwards, weakening and dying out as they did. Wintry showers remained over the north coast of Scotland. This left most of Wales, Northern Ireland and northern and Central England with clear skies and dry spells, low cloud being seen over south England. Another cold day, with mildest temperatures being seen to the south west.

## Daily Weather Summary for Monday 25 January 2021

This day's summary created 01/02/2021 03:00

### Summary of the UK Weather for Monday 25 January 2021

It was a very cold start with ice and frost nationwide. Snow accumulations were reported across the country, with wintry showers over the south east of England. As the night progressed a few mist and fog patches developed, though most places remained clear. Light winds were experienced by many, but breezy along some eastern and Scottish coasts. Showers persisted across western and central Scotland, and western Northern Ireland, throughout the day, extending down to northwest England at times. While calm for most, Scottish and North Sea coasts saw the strongest winds. Skies were quite clear for most throughout the day, with predominantly high cloud, and the south seeing the most low cloud. Due to these clear skies, and lying snow in parts, it was quite a cool day across the country, although the southwest saw some relatively mild temperatures at times. As the evening progressed, a band of rain was still affecting central Scotland, Northern Ireland, and the far north of England, wintry in places, with the rest of the country seeing drier conditions and largely clear skies.

This day's summary created 02/02/2021 03:00

### Summary of the UK Weather for Tuesday 26 January 2021

The day began with rainfall over southern parts of Scotland, and dry elsewhere. However, a low pressure system to the west soon began to introduce rainfall eastwards, giving showers over parts of Northern Ireland, Wales and the far southwest of England. Though initially there was relatively little cloud cover, thicker cloud soon moved in, covering most of the UK by dawn. It was another cold night, with the mildest of any temperatures being seen to the southwest. The band of rainfall continued to move eastwards though the day. It turned to snow down to modest elevations in eastern and southern Scotland, and northern England. The rain had cleared Northern Ireland, Wales and much of the Southwest by the afternoon, and cleared the UK by midnight, with just a small band of wintry showers remaining in southern Scotland. It stayed cloudy in all areas during the day, and in England and Wales the cloud lowered during the evening, producing hill fog. Coastal fog affected Cornwall throughout the afternoon. It was windy along the west and south coasts during the day.

This day's summary created 03/02/2021 03:00

### Summary of the UK Weather for Wednesday 27 January 2021

It was a cloudy start across much of the country, with rain moving eastwards across Wales, central and southern Scotland, and southern England. Winds were quite calm throughout, with the strongest occurring along channel coasts. By morning, the rain was largely over southeast England and northeast Scotland, and it was still cloudy for most of the UK. It was a mild night for all areas except the far north. The day started off mostly dry and rather murky for many with cloud prevailing across the country. In the south it was not as cold as recently, but there was still a frost in northern Scotland. Parts of northeast Britain experienced showers during the morning, and an area of light rain made its way southwards across areas in the south. A large area of rain arrived into the southwest of the UK and slowly moved northeastwards, persisting across parts of England, Wales and Northern Ireland during the afternoon. The contrast in temperatures continued as northern UK was cold and the south was mild.

### Summary of the UK Weather for Thursday 28 January 2021

A large band of rain and low cloud pushed northeastwards across the UK during the night, affecting all areas before dawn apart from northeastern Scotland. The rain turned to snow over the high ground of northern England, the Southern Uplands and the Scottish Highlands. Fog was widespread in central and southern England, and Wales. By dawn, most of the cloud and rain had cleared Wales and the south of England. Western and southern coastal areas experienced strong winds through the night. Southern areas experienced a very mild night whereas the north was cold. The band of rain across northern England and much of Scotland progressed eastwards during the morning hours. Through the afternoon, further rain swept across Northern Ireland, with patches of precipitation across areas of England and Wales, predominantly in southwestern and northwestern parts. Through the evening, a band of heavy rain from the Atlantic affected western areas of the UK. Into the night, the rain was heaviest over Wales and southwest England, and continued tracking eastwards.

This day's summary created 05/02/2021 03:00

### Summary of the UK Weather for Friday 29 January 2021

The night saw outbreaks of rain across central and southern Scotland, as a large area of rain extended all the way across eastern Britain, with its heaviest downpours being over southeast England. This rain continued pushing eastwards, eventually clearing England, yet persisting across central and northern parts of Scotland, falling as snow over the hills. Showers then moved into the southwest of the UK, heaviest across south Wales. In contrast, most of Northern Ireland remained dry through the night and rather cloudy. Conditions were windy across the South West and across south Wales, particularly along coasts. It was a mild and murky day for many, with low cloud, and temperatures in the low double figures. The patchy, wintry precipitation over southern Scotland and northern, bar northeast, England died out, leaving behind cloud and a few clear spots. Storm Justine (named by the Portuguese Met Office) pushed heavy rain moves towards Cornwall and further northeast.

This day's summary created 06/02/2021 03:00

### Summary of the UK Weather for Saturday 30 January 2021

Saturday commenced with a band of rain across southwest England and Wales, slowly moving northeast. Cloud from this feature spread over much of the UK with the clearest skies over the north, where temperatures were coldest. A cold, northerly flow brought wet or wintry showers over the north of Scotland and the east coast. From the early hours to the late afternoon, the heavy band of rain in the south progressed into Wales, the Midlands and the southeast, stalling here and colliding with a colder airmass that brought prolonged, static rain and snow over high ground. Winds were strong in the west with gales along the western coasts. Elsewhere across the UK it remained largely dry with sunny spells. A few showers continued in the far north and east. Through the late afternoon the rain band slowly weakened and moved southeast clearing the south coast during evening, with clear spells developing widely from the north. A cold evening and night ensued.

This day's summary created 07/02/2021 03:00

### Summary of the UK Weather for Sunday 31 January 2021

It was a dry night for much of the UK apart from some wintry showers occurring over the far north and showers along the northeast coast in a cold northerly flow. Temperatures dropped widely below freezing away from the far south with the joint coldest overnight temperature of the season so far. Winds were generally light apart from Northern Ireland and some western coasts. Cloud cover gradually increased in the west through the late night, ahead of an occlusion bringing heavy rain. A band of heavy rain moved into Northern Ireland and into the southwest of England and Wales through the morning. As it moved northeast into the colder air the leading edge increasingly fell as sleet and snow especially over the higher ground and in heavier bursts. Elsewhere conditions remained largely dry and cloudy, with any sunny spells confined to the far north, along with the remaining wintry showers. Precipitation increasingly became light and patchy inland, and through the evening and night the band of precipitation slowly moved southeast, gradually weakening further with clearer spells developing from the north.

## Daily Weather Summary for Sunday 31 January 2021

## Daily Weather Summary for Sunday 31 January 2021

## Guidance Notes

UTC = Universal Coordinated Time. For the UK UTC is the same as GMT (Greenwich Mean Time).

National boundaries shown on the European station map are for illustrative purposes only.

### Daily extremes

- Daily extremes have been manually confirmed by Met Office Observations Quality Management as valid observations from the live database at the time of checking. However, more extreme values may still be possible if they occur after the time of production.
- Mountain stations above 500 masl are excluded from lowest temperatures, highest gust speeds and greatest snow depths at 0900 UTC. This is because they are not considered representative of low level areas.
- Counties quoted against each station are based on historical county boundaries pre-1974 and may not reflect current administrative boundaries.

### Analysis charts and satellite imagery

- The satellite imagery is infra-red imagery from the geostationary MSG satellite.
- The rainfall image is derived from satellite data from MSG and rain-radar data. This represents a snapshot of instantaneous rain-rates at 0000 UTC and 1200 UTC and so does not necessarily reflect daily accumulations in the rainfall station map.
- Any analysis charts or satellite images which are unavailable will be displayed as white space.

### Station maps

- The UK maps show station data for the same set of stations presented UK data table. These stations are selected to provide good spatial coverage across the UK; they represent only a fraction of the overall UK observing network.
- Wind speed maps show wind speed in Kt and direction both averaged over the hour up to the time of observation. 1 Kt = 1.151 mph.

### Hourly station data

- The data tables provide spot hourly observations from synoptic messages at 0000 and 1200 UTC. Missing data are denoted by '-'.

- Pressures are mean sea level pressure in hPa.
- For UK stations, Gibraltar and Jersey, the wind speeds and directions are both averaged over the hour up to the time of observation. However, for European stations wind speeds and directions are both averaged over a 10-minute period up to the time of observation.
- Wind speeds are in Kt. Wind directions are stored in the database every 10 degrees and have been converted to the nearest point of the compass. These give the direction the wind is blowing from, not to.
- Cloud amounts are in Oktas from 0 (clear) to 8 (overcast). 9 indicates sky obscured (eg by fog).
- Air temperature and dew point temperature are in Celsius.

### **Temperature maps**

- Daily maximum, minimum and grass minimum temperatures are in Celsius.
- The period for the daily maximum temperature on day D is defined from 0900 UTC day D to 0900 UTC day D+1.
- The period for the daily minimum and grass minimum temperatures on day D is defined as 0900 UTC day D-1 to 0900 UTC day D.
- On any given day D the minimum will typically occur in the early hours of the morning and the maximum in early afternoon.

### **Rainfall, sunshine and max gust speed maps**

- Daily rainfall is in mm from 0900 UTC day D to 0900 UTC day D+1.
- Daily sunshine is in hours from Kipp and Zonen CSD1 automatic sunshine records. Bright sunshine is defined as exceeding 120 W/m<sup>2</sup>.
- Max gust speeds are the daily max gust in Kt from 0000-0000 UTC

### **Snow maps**

- The day of snow falling map displays data from present weather sensors, showing stations which have recorded sleet or snow falling at any point in the day (0000-0000 UTC).
- The snow lying map shows level snow depth as recorded by the automatic snow depth sensors at 0900 UTC. These snow depth sensors do not record snow depth if this is less than 1cm.
- Snow depth sensors are normally operational from October to April, in the event of snow falling outside this period data availability may be limited.
- Snow maps will only be displayed if one or more of the selected stations on that date have recorded either snow falling or non-zero snow depths. If snow maps are not

displayed it is still possible that other stations in the network have recorded a day of sleet or snow falling or non-zero snow depth.
