## Daily Weather Summaries for December 2017

**If you have any questions or feedback about this product or wish to obtain further data please contact the Met Office.**

This document contains daily weather summaries for each day of December 2017. The Met Office National Meteorological Library and Archive holds a continuous record of daily weather summaries or daily weather reports from 1860, and these daily weather summaries form a continuation of that series.

The purpose of each summary is to provide an overview of the weather conditions across the UK on that day, with the historical emphasis mainly based on observations from surface network of weather stations, although the format has varied over the decades. While the emphasis remains on observations from the surface network, the current daily weather summaries supplement these by including satellite and rain-radar imagery to provide a more complete overview. The current format of the daily weather summaries is as follows:

1. Text summary of the main characteristics of the weather during the day, written by an operational meteorologist in the Met Office operations centre.
2. Table of daily extremes for the UK for key climate variables including temperature, rainfall, sunshine and gust speeds.
3. Overview of the synoptic situation at 00 and 12 UTC comprising: analysis charts showing the surface pressure pattern and associated weather fronts; North Atlantic and European infra-red satellite images showing cloud-cover; combined infra-red and rain-radar images of the UK; maps of wind speed and direction at 00 and 12 UTC; observations of pressure, wind speed and direction, cloud cover, air and dewpoint temperature at selected UK and European stations in data tables.
4. UK maps of key climate variables from observing stations including maximum, minimum and grass minimum temperature, rainfall, sunshine, gust speed and snow.
5. Further guidance notes

If you spot any data errors or omissions in this product please contact the Met Office.

## Daily Weather Summary for Friday 01 December 2017

This day's summary created 08/12/2017 02:00

### Summary of the UK Weather for Friday 01 December 2017

It was a chilly day with lots of sunshine, especially across much of England and Wales. However, it turned cloudy in Northern Ireland and Scotland where there was also a little patchy rain. Elsewhere there was a good deal of dry weather away from the east and southeast of England, where showers continue throughout the day. Most of these showers fell as rain but there was some snow and sleet to start the day over high ground. Showers across Kent were especially heavy, with a couple of thunderstorms. Temperatures were below average for the time of year.

### Daily Extremes

<i>Highest Maximum</i>	<b>9.3°C</b> Scilly: St Marys Airport (Isles Of Scilly, 31 mAMSL)
<i>Lowest Maximum</i>	<b>2.3°C</b> Kielder Castle (Northumberland, 201 mAMSL)
<i>Highest Minimum</i>	<b>4.7°C</b> Camborne (Cornwall, 87 mAMSL)
<i>Lowest Minimum</i>	<b>-5.0°C</b> Katesbridge (Down, 91 mAMSL)
<i>Lowest Grass Minimum</i>	<b>-8.6°C</b> Velindre (Powys (south), 152 mAMSL)
<i>Most Rainfall</i>	<b>12.2mm</b> Resallach (Sutherland, 133 mAMSL)
<i>Most Sunshine</i>	<b>7.2hr</b> North Wyke (Devon, 177 mAMSL)
<i>Highest Gust</i>	<b>44Kt 51mph</b> Donna Nook No 2 (Lincolnshire, 8 mAMSL)
<i>Highest Gust (mountain)</i>	<b>50Kt 58mph</b> Cairngorm Summit (Inverness-shire, 1237 mAMSL)
<i>Greatest Snow Depth at 0900 UTC</i>	<b>12cm</b> Copley (Durham, 253 mAMSL)

mAMSL refers to station elevation in metres above mean sea level.

This day's summary created 09/12/2017 02:00

### Summary of the UK Weather for Saturday 02 December 2017

It was a largely cloudy start across the British Isles today, however some sunshine did emerge in areas such as eastern England as we went through the day. It was a slightly milder day than recent days, and many places across the country felt warmer, aside from the southeast of England where it still felt rather chilly. For most areas it was dry, but there were a few light showers in Wales, southwest England and Northern Ireland. A weather front sank south across northern Scotland too, bringing rain for much of the afternoon here. Temperatures were generally around average.

### Summary of the UK Weather for Sunday 03 December 2017

It was a fairly quiet picture across the UK through the early hours of Sunday with a weak weather front spreading southwards. This delivered rather cloudy skies as well as some patchy light rain and drizzle. With a fair amount of cloud around it was a less cold night than earlier in the week. However, behind the front skies cleared across Scotland and northern England allowing it to turn colder here later in the night with a few patches of frost. Through the day it remained quiet with variable amounts of cloud and a few bright or sunny spells. The best of the sunshine was across eastern parts of England, but most areas saw some brighter spells. In the west there were a few light showers, but on the whole it was mainly dry across the UK. Compared with recent days it was milder with temperatures a little above average for the time of year in many areas. Through the evening under clearer skies it started to turn cold, with some mist and fog developing for some.

### Summary of the UK Weather for Monday 04 December 2017

Sunday night was mostly dry and cloudy across the UK, although some eastern parts did see clearer spells, leading to a touch of frost and some fog patches to form in places such as across eastern Yorkshire and in southern England. It was a much cloudier night across northern and western parts of the UK where there was some hill fog and one or two outbreaks of light rain or drizzle. Some more persistent outbreaks of rain affected the far north and west of Scotland. Under these cloudier skies, it was largely frost free. After a chilly start in some eastern parts of the UK, it was a decent day here, with plenty of sunshine and fairly light winds. However this was a complete contrast to northern and western areas, where it was a mostly cloudy day, with occasional brighter spells. For many it was a dry day with rain clearing away from the far north of Scotland, but where the cloud was thickest in the north and west there were a few light showers.

This day's summary created 22/02/2018 12:58

### Summary of the UK Weather for Tuesday 05 December 2017

It remained quiet through the early hours of Tuesday with largely dry, but fairly cloudy weather with a few outbreaks of rain across western parts. Winds were light and a few mist and fog patches developed across southern and eastern areas, although these were not widespread or particularly dense. Through the day it remained fairly dry and cloudy across many areas, with the best of any brighter spells to the east of higher ground, especially across northeast England. Some rain arrived across the north and northwest of Scotland, which turned more persistent through the day. Winds remained light across many central and southern parts, but a developing south-westerly wind, made for a breezier day across Northern Ireland, Scotland and parts of northern England. On the whole, temperatures were slightly higher than normal for early December, especially in the best of any brightness across the northeast of England. Despite this, it felt cooler under stronger winds and rain in the northwest.

### Summary of the UK Weather for Wednesday 06 December 2017

It was quiet and mild through the early hours with rather cloudy skies and some outbreaks of light and patchy rain on western up-slopes. Some of the heaviest rain was across northwest Scotland, where the winds also picked up through the day ahead of an approaching frontal system. Temperatures were mild with no frost in the UK.

It was a mostly cloudy and mild day across the UK, with a strengthening south-westerly wind. However, there have been some breaks in the cloud, giving some bright or occasional sunny spells, especially across parts of northeast England. Meanwhile, frontal systems moving in off the Atlantic have been bringing outbreaks of rain across western parts of Scotland, Northern Ireland and into parts of northern England as the day progressed. A very mild day for many, with a maximum temperatures well into double figures.

### Summary of the UK Weather for Thursday 07 December 2017

During the early hours Storm Caroline approached the UK, bringing winds in excess of 50mph to many places in Scotland. Elsewhere it was windy, and a band of cloud and rain cleared the northwestern half of the UK by dawn. There were some heavy bursts at times and over the high ground in Scotland there was some snowfall. Overnight minimum temperature however stayed above freezing.

Through the day time, the band of cloud and rain cleared the southeastern half of the UK, and temperatures dropped considerably across the UK as the front cleared. Brighter conditions followed, with showers filtering into northern areas in the morning, and into the rest of the UK later in the day. The showers fell as snow in Scotland, and later in the afternoon turned to sleet and snow across parts of Northern Ireland, northern England, and north Wales. Daytime high temperatures were found in the milder air along the south coast, some 5 degrees milder than average, which was a stark contrast with the colder conditions invading the north.

By the late evening colder conditions were in place across the UK, and showers from the north became increasingly wintry.

## Daily Weather Summary for Thursday 07 December 2017

## Daily Weather Summary for Friday 08 December 2017

This day's summary created 15/12/2017 02:00

### Summary of the UK Weather for Friday 08 December 2017

Throughout the day, snow showers fed in across northern and western parts of the UK. The north of Scotland saw frequent snow showers with widespread accumulations here. Northern Ireland also saw frequent snow showers and once again saw accumulations. Some parts of northwest England, the west Midlands and Wales also saw snow showers moving through leading to significant accumulations in some areas. It was also a windy day with gale force gusts in places. Away from the showers it was a dry and bright day with plenty of sunshine. However, temperatures across the UK were well below average, with the strong wind accentuating the cold feel. However across parts of Devon and Cornwall temperatures were around average for the time of year.

## Daily Weather Summary for Friday 08 December 2017

## Daily Weather Summary for Saturday 09 December 2017

This day's summary created 16/12/2017 02:00

### Summary of the UK Weather for Saturday 09 December 2017

It was a cold and dry night for most parts with plenty of clear spells. However, snow showers persisted across north and west Scotland as well as across north Wales and through the Cheshire Gap. These showers fell on areas of lying snow, adding to accumulations in places. It was particularly cold across areas of lying snow with many places falling several degrees below freezing.

During the daytime it was cold across the UK, with wintry showers feeding in across some parts of northwest England, including Cheshire, Lancashire, Merseyside and Staffordshire. There were also wintry showers across northern parts of Northern Ireland, north and west Scotland and in north Wales. Elsewhere there was a good deal of dry weather, with the best of the sunshine in southern Scotland, and northeast England. Compared with Friday, winds were much lighter. It became cloudier in the southwest through the afternoon with rain then spreading northeastwards through the evening.

## Daily Weather Summary for Sunday 10 December 2017

This day's summary created 12/12/2017 02:00

### Summary of the UK Weather for Sunday 10 December 2017

Snow showers persisted across northern and western Scotland overnight, elsewhere it was mainly dry with clear spells. However, rain in the far southwest steadily moved northeastwards through the night, reaching south Wales through the early hours where it quickly turned to snow. The snow then spread east and northeast to reach north Wales and Milton Keynes by morning.

Throughout the day the snow continued across Wales and many parts of England, including the Midlands, some parts of southwest England such as Bristol and also some parts of eastern and southeastern England. A large area of England and Wales saw significant accumulations of snow and some significant disruption. Further north across the far north of England, Scotland and Northern Ireland it was a drier day and it was very cold, but here there was some sunshine, despite a scattering of showers in northern Scotland. In the south west and far south of England it was a largely cloudy day with outbreaks of rain at times and it was very windy in places.

Through the evening, further snow affected many central areas of the UK but it was lighter than during the day. Wintry showers also affected many northwestern areas. It turned exceptionally cold after dark, especially across the snow fields of Scotland.

## Daily Weather Summary for Monday 11 December 2017

This day's summary created 13/12/2017 02:00

### Summary of the UK Weather for Monday 11 December 2017

Light snow fell across central parts of England and much of Wales through the early hours, although this gradually eased with a lot of lying snow left on the ground from what had fallen on Sunday. A few wintry showers also affected Northern Ireland and parts of Scotland. Elsewhere, it was drier with some dense patches of freezing fog across southeast England. A severe frost developed across many northern and central parts, although in the south it was slightly less cold as cloud thickened with some rain, sleet and snow arriving around dawn. This then continued through much of the day across southeast England, with some accumulations of snow over the hills, accompanied by strong to gale force north- easterly wind. It gradually cleared eastwards through the afternoon. Elsewhere, it was a fine day with plenty of sunshine, although a scattering of wintry showers affected coasts of Scotland, Northern Ireland and parts of Wales and the far southwest, with a brisk northerly wind. All parts were cold, with temperatures below average, especially where there was snow cover on the ground. Temperatures rapidly dropped through the evening.

This day's summary created 19/12/2017 02:00

### Summary of the UK Weather for Tuesday 12 December 2017

Temperatures continued to plummet through the early hours of Tuesday, especially under clear skies and snow covered fields. Some of the coldest areas were mid and east Wales as well as parts of the midlands, where we saw a severe frost and widespread ice. Showers fed in across eastern parts of England and Scotland, falling as a mixture of rain, sleet and snow. A few showers also affected Pembrokeshire, Cornwall and Devon, but these were mostly of rain. Some patches of freezing fog developed through the early hours under light winds, and these were slow to clear in places through the morning. Otherwise most parts had a very cold but sunny start to the day. Cloud gradually spread in to the west through the morning, with rain reaching Northern Ireland late morning. This then spread into Scotland and northwest England with a mixture of rain and hill snow. Further south and east, it remained sunny, but cold with frost and ice lingering all day, especially where lying snow remained. Temperatures stayed below average for most parts, but it turned less cold in the far southwest.

This day's summary created 20/12/2017 02:00

### Summary of the UK Weather for Wednesday 13 December 2017

Showery rain pushed eastwards during the night with some heavy bursts in places, before clearing to leave clearer skies. This caused some mist and fog to form in places, especially across eastern parts of England. Elsewhere, winds began to strengthen and it turned showery in the north and west with some heavy, blustery showers packing in during the early hours. Any mist or fog cleared early in the morning. Showery outbreaks of rain continued to push southeastwards during the rest of the day with some sunny spells in between. It felt cold in most places in a keen breeze. Showers were blustery with the odd rumble of thunder across Northern Ireland. The rain fell as sleet and snow over higher ground giving some accumulations, mainly across northern parts. Sleet and snow also fell to lower levels at times towards the end of the day. Temperatures fell quickly after dark, with icy stretches forming across parts of the country.

## Daily Weather Summary for Thursday 14 December 2017

This day's summary created 21/12/2017 02:00

### Summary of the UK Weather for Thursday 14 December 2017

Showery outbreaks continued to feed in across western parts of the UK through the small hours and into the morning on Thursday, with a strong westerly or northwesterly wind, especially on western coasts and across the south and southwest of England and Wales. Gusts of up to 64 knots were recorded at Seven Stones lightship just to the west of Land's End in association with showers, although more broadly along western coasts gusts did not reach these high values. Showers fell and sleet or snow over high ground, especially in the north. Showers and bands of showers continued to feed in from the north and west across the UK, but much of the Midlands, and east and southeast England remained dry and saw some good sunny spells. Winds eased gradually for some although they stayed near to gale force across the far southwest.

This day's summary created 22/12/2017 02:00

### Summary of the UK Weather for Friday 15 December 2017

The early hours of Friday saw further bands of showery rain, sleet and snow drift their way southwards across many parts of the UK. Most of the snow was confined to the hills, but falling snow was reported across parts of the Midlands and into the London area. Where skies cleared, ice formed, making for another tricky commute for some, and indeed there was quite a sharp frost across eastern Scotland during the first part of the night. Things became a little more straightforward during the day as a northerly breeze developed across all parts. Initially this was strong across southwestern areas, but it did moderate through the day. Showers became focussed across northern Scotland, around some western coasts and across eastern counties of England. Again, there was some wintriness in the showers, chiefly across the mountains of Scotland. Many inland areas became dry with increasing amounts of sunshine. Wherever you were, it was another cold day, with temperatures widely below normal and in the breeze it felt colder still. As the sun set, it started to turn frosty again.

## Daily Weather Summary for Saturday 16 December 2017

This day's summary created 23/12/2017 02:00

### Summary of the UK Weather for Saturday 16 December 2017

A ridge of high pressure was centred to the west of the UK and Ireland bringing a polar maritime air mass across the country on a northwesterly or northerly wind. Most places across the UK were clear and cold through the early hours. Although showers continued to affect those coastal areas exposed to the wind, such as Northern Ireland, North Wales and parts of northwest England. A widespread frost formed across much of the UK. Through the daytime it stayed clear and dry for most places, with plenty of blue sky and crisp winter sunshine; although it remained cold. A plume of showery weather sank southwards across Wales, the Midlands, southwest England, as well as south and southeast England during daylight hours, mostly clearing into the English Channel by dark. The night saw a few mist and fog patches developed through the early part of the evening where the showers had been. Many parts of the UK saw clear skies, with just a few remnant showers across Wales and the Southwest. It became cloudier across Northern Ireland.

This day's summary created 24/12/2017 02:00

### Summary of the UK Weather for Sunday 17 December 2017

It was a generally dry night across the UK with plenty of clear spells, especially in eastern areas. The wind gradually eased through the night with many central, southern and eastern areas becoming light and variable through the early hours. Due to the clear skies and light winds, fog patches formed quite widely through the early hours across central, southeastern and northern England. A band of cloud and rain then approached the far northwest of the UK towards morning. It was a chilly night for many, especially under the clearer skies.

The band of cloud and rain moved southeastwards through the day, clearing much of the fog as it progressed. The rain was heavy at times, and it only cleared the far southeast by early evening. Following the main band of rain there were areas of mist and drizzle across much of England and Wales, but across Scotland and Northern Ireland the skies cleared in most places by the evening. Temperatures were noticeable milder than on recent days, but quickly fell away again in the clearer conditions in the north.

This day's summary created 25/12/2017 02:00

### Summary of the UK Weather for Monday 18 December 2017

It was dry through the early hours across the UK, with only a little patchy drizzle affecting western and northwestern coasts at times. There were variable amounts of cloud and clear skies across most areas, and away from the far northwest, winds were light. The clear skies and light winds allowed temperatures to fall away quickly, so many places had a rather chilly start to the day, away from the west coast. Some mist and fog also formed through the early hours, but this was rather patchy and mainly confined to the far south and northwest England.

Throughout the daytime there was plenty of sunshine across the UK, however some fog did linger across parts of northwest England and the west Midlands too. Gradually thicker cloud spilled into parts of western Scotland and Northern Ireland and there was also some light and patchy rain across the far west of Scotland and also the Northern Isles. Temperatures were around average in the west, but colder than average in the east.

### Summary of the UK Weather for Tuesday 19 December 2017

There was a large contrast in the weather across the UK overnight with cold and frosty conditions across the southern half of the UK, and very mild conditions across parts of northern and western Scotland. Areas of dense fog developed across Central and Southern England while further north it was rather cloudy, with low cloud bringing extensive hill fog to the northwest, and with some patchy rain continuing over western and northern parts of Scotland. Any lingering patchy fog lifted by mid morning and then many central and eastern areas had a dry day with some sunny spells. Western and northern areas were cloudier, with low cloud bringing areas of mist and fog over windward coasts and hills. It became breezy in the far north, and outbreaks of rain spread into Scotland late in the afternoon. For those in the north and west of the UK it was a mild day with temperatures several degrees above average for the time of year. However, further south and east it was chillier.

This day's summary created 11/01/2018 09:47

### Summary of the UK Weather for Wednesday 20 December 2017

It was a mild but cloudy night in many areas, with extensive low cloud, mist and hill fog particularly across central, southern and eastern England. Although it was largely dry in this area, there were a few outbreaks of drizzle in northwest England and the high ground of Wales. Further north across Scotland, Northern Ireland and the far north of England, a band of rain gradually travelled southeastwards with time. The rain cleared Northern Ireland and Scotland by dawn, leading to a drier end to the night here with some breaks in the cloud.

Wales and central and southern parts of England had a very misty, cloudy day with areas of fog first thing lifting only slowly through the morning. Further north outbreaks of light rain and drizzle across Northern England sank slowly south and retreated westwards through the day, with only light drizzle lingering over parts of Wales by evening. Scotland and Northern Ireland were largely dry with bright and at times sunny spells, with these brighter conditions reaching the far north and northeast of England through the afternoon.

### Summary of the UK Weather for Thursday 21 December 2017

Thursday started with a warm front lying across Northern Ireland and northern England. To the south of the warm front it was a mild night across the UK with widespread overcast low cloud, mist and patchy fog with hill fog and drizzly precipitation over western hills. To the north of the warm front, across Scotland, there was clearer and drier weather although with a few showers across the north of the country. Rain cleared many parts through the morning, although it lingered across Northern Ireland and Lancashire. Cloud and murky conditions struggled to clear across the south of the UK, and it remained cloudy. It remained dry across much of Scotland with some cloud. Winds throughout the day were light across the UK.

### Summary of the UK Weather for Friday 22 December 2017

Friday started cloudy across much of the UK with an area of rain over Wales and parts of the West Country and areas of mist and fog. The rain moved southeast into southern England through the small hours, clearing into the English Channel by dawn. The clearest conditions during this period were across eastern Scotland and northeast England with a hard frost. It was windy across the Northern Isles.

It was mostly dry during the daylight hours across much of the UK, albeit with a great deal of low cloud and areas of mist and hill fog spread quite widely. However, hill fog and mist did clear slowly through the day and to the east of high ground some bright and sunny spells developed. Through the afternoon drizzle and rain moved into western Scotland, although the east remained dry with some sunny spells and it stayed windy across the Northern Isles. It was a mild day in the south with temperatures a few degrees above average.

This day's summary created 30/12/2017 02:00

### Summary of the UK Weather for Saturday 23 December 2017

The UK lay under the northern flank of a slowly declining ridge of high pressure, with a southwesterly air flow drawing up mild air from lower latitudes. A frontal system lay west to east across northern Scotland. Most parts of the UK were mild during the small hours of Saturday morning, with strengthening winds and outbreaks of rain across parts of northwestern Scotland. Elsewhere, low cloud and mist became widespread with some fog and light drizzle around western coasts. However, clear spells forming to the lee of the Pennines allowed temperatures to drop across Northeast England. Here a localised grass frost formed by dawn. During daylight hours the wind strengthened across Scotland and northern England and the patchy rain across northwest Scotland edged southwards into the Central Belt by evening. Most places stayed dry, however, with most sunshine across eastern England. On Saturday night the rain persisted across western Scotland. Elsewhere, it was mostly dry and partly cloudy, with patchy mist and low cloud, especially along western coasts.

### Summary of the UK Weather for Sunday 24 December 2017

It was a wet night across western Scotland as an active weather front became slow moving here. Elsewhere, aside from some occasional drizzle around western coasts and hills, it was dry, albeit with a fair amount of cloud. One or two breaks did develop, mostly notably in the Exeter area, allowing it to turn quite chilly here, bucking the otherwise mild theme. Through the day, the heavy rain in the northwest slowly pushed south affecting parts of Northern Ireland, southwest Scotland and especially Cumbria by the afternoon. To the north of this, it dried up a touch across northern Scotland. The rest of England and Wales saw a continuation of the theme of recent days' weather - plenty of cloud, just a few breaks here and there, a brisk breeze and some mild temperatures.

This day's summary created 01/01/2018 02:00

### Summary of the UK Weather for Monday 25 December 2017

Through the early hours of Christmas Day morning a band of heavy rain and strong winds affected Scotland, Northern Ireland and parts of northern England. Across the rest of the UK it was cloudy and rather mild with some light rain or drizzle at times in western areas. The coldest temperatures were recorded in the north, especially in sheltered parts of Scotland.

Through the day on Christmas Day, the band of rain across the north moved slowly southeastwards, reaching into Yorkshire, the east Midlands and southwest England by the evening, with heavy bursts and strong wind gusts as the rain moved through. To the north of the rain band there were brighter spells with blustery showers, some of which were wintry over the Scottish high ground. To the southeast it was mainly dry, but increasingly cloudy and windy. It remained rather chilly across the far north, but mild in the south with many places remaining in double figures.

## Daily Weather Summary for Tuesday 26 December 2017

This day's summary created 02/01/2018 02:00

### Summary of the UK Weather for Tuesday 26 December 2017

Through the early hours, a band of cloud and rain cleared eastern parts of the UK, whilst elsewhere it was dry with clear spells for many. There was the odd shower in places, and these were more frequent across northern England. The clearance of the weather front brought colder temperatures for many areas, especially in the north, with lows falling well below freezing in a number of spots.

Through the day, there were clear and sunny skies for many areas around the UK, and occasional showers between the sunny spells. However, a band of heavy and persistent rain started to push into southwest England into the afternoon, reaching Wales and the Midlands by mid afternoon. Temperatures during the day were rather chilly for many, although the south and far southwest remained a little above the average for the time of year. Through the evening the rain continued to spread into England and Wales, and turned to snow in places, particularly over the higher ground of Wales.

This day's summary created 03/01/2018 02:00

### Summary of the UK Weather for Wednesday 27 December 2017

A band of heavy rain, sleet and hill snow moved slowly eastwards from southwest England and western Wales overnight, lying over much of central and southern England by morning. The snow and rain, combined with strong to gale force winds, caused traffic and travel disruption as well as power outages. Elsewhere across the UK it was cold and windy with clear spells. There were scattered showers over Northern Ireland and northern Scotland with patchy ice reported in Northern Ireland towards morning. The band of rain, sleet and snow continued to edge its way eastwards through the morning and early part of the afternoon. Wintry showers also continued to affect Northern Ireland, northern Scotland, Wales and south west England through the day. Elsewhere during the afternoon there was plenty of sunshine, but it still felt cold in brisk winds. Skies stayed on the cloudy side across East Anglia though, with sleet, snow and heavy rain easing. Temperatures were well below average for the time of year, and fell quickly after sunset, with a widespread frost and icy stretches.

### Summary of the UK Weather for Thursday 28 December 2017

Scattered showers pushed into the north and west through the early hours, turning wintry over higher ground across Scotland, with snow accumulating over the hills. Elsewhere, it was a dry night with clear skies, allowing temperatures to fall away and a widespread frost to develop. Some isolated pockets of freezing fog formed across parts of Northern Ireland.

Any fog quickly cleared through the morning and much of the UK had a dry and sunny day, but it was also cold. Showers eased a little but a few continued across the far north and west. During the evening, a weak band of patchy rain edged into the far southwest and skies turned increasingly cloudy. Elsewhere, temperatures fell away quickly after dusk to allow an early frost to develop. Temperatures were colder than average for the time of year across the UK.

### Summary of the UK Weather for Friday 29 December 2017

Friday started mostly dry and cold with an active frontal system pushing eastwards across Northern Ireland, Wales and the Southwest, through the small hours; and, then the rest of the UK through daylight hours. Bands of heavy showers followed on behind the initial rain band, although they died out from the west through the afternoon. Precipitation fell as snow over the hills and mountains of Northern England, Northern Ireland and Scotland, and, in some cases it fell as snow to low levels causing travel disruption. However, precipitation remained as rain across the rest of England. There were some notable strength gusts recorded in the squally features that followed on behind the morning's rain band across the South of the UK. It remained windy for western parts into the evening with a further spell of rain pushing into western parts during the evening and then overnight into Saturday.

This day's summary created 06/01/2018 02:00

### Summary of the UK Weather for Saturday 30 December 2017

Saturday started with a warm front across Northern Ireland, Wales and the South with clearer conditions across Scotland. The warm front moved northeast through the small hours giving snow over high ground and rain and drizzle elsewhere. The front had largely cleared the east coast by morning and much of England and Wales was covered by areas of stratus and patchy drizzle. Showers continued to spill into western parts of the UK through Saturday morning with the best of the dry weather in the east and southeast. It stayed windy across the UK throughout the period too with the west seeing the strongest winds. Rain arrived in the far Southwest by the late afternoon. A very mild day across England and Wales, but it stayed cold across eastern parts of Scotland.

This day's summary created 07/01/2018 02:00

### Summary of the UK Weather for Sunday 31 December 2017

Wet and windy weather spread east across England and Wales during the early hours, with gales in exposure. The rain then cleared southeast England during the second half of the morning, to leave a sunnier spell across England and Wales, before showers developed from the west. The showers were heavy and thundery in places, especially during the evening. Meanwhile Storm Dylan brought some very windy weather to Scotland, Northern Ireland and the north of northern England, with severe gales reported, especially during the morning and early afternoon. The wind was also accompanied by showery outbreaks of rain and some hill snow. The winds eased off during the second half of the day as Storm Dylan moved out into the North Sea but it remained blustery throughout the rest of the day, with some further spells of showery rain. Finally after a mild start in the south, many places turned colder throughout the day, with the wind making it feel even colder in places.

## Daily Weather Summary for Sunday 31 December 2017

## Daily Weather Summary for Sunday 31 December 2017

## Guidance Notes

UTC = Universal Coordinated Time. For the UK UTC is the same as GMT (Greenwich Mean Time).

National boundaries shown on the European station map are for illustrative purposes only.

### Daily extremes

- Data in the table have been manually checked unless denoted by an asterisk.
- Checked values have been manually confirmed by Met Office Observations Quality Management as valid observations from the live database at the time of checking. However, more extreme values may still be possible if they occur after the time of production.
- Asterisked values have been automatically extracted from the live database with no further quality control carried out beyond normal Met Office procedures. This means that some suspect data are possible.
- Duplicate values will be presented if these occur, allowing for up to 10 duplicates.
- Mountain stations above 500 masl are excluded from lowest temperatures, highest gust speeds and greatest snow depths at 0900 UTC. This is because they are not considered representative of low level areas.
- Counties quoted against each station are based on historical county boundaries pre-1974 and may not reflect current administrative boundaries.

### Analysis charts and satellite imagery

- The satellite imagery is infra-red imagery from the geostationary MSG satellite.
- The rainfall image is derived from satellite data from MSG and rain-radar data. This represents a snapshot of instantaneous rain-rates at 0000 UTC and 1200 UTC and so does not necessarily reflect daily accumulations in the rainfall station map.
- Any analysis charts or satellite images which are unavailable will be displayed as white space.

### Station maps

- The UK maps show station data for the same set of stations presented UK data table. These stations are selected to provide good spatial coverage across the UK; they represent only a fraction of the overall UK observing network.
- Wind speed maps show wind speed in Kt and direction both averaged over the hour up to the time of observation. 1 Kt = 1.151 mph.

## Hourly station data

- The data tables provide spot hourly observations from synoptic messages at 0000 and 1200 UTC. Missing data are denoted by '-'.
- Pressures are mean sea level pressure in hPa.
- For UK stations, Gibraltar and Jersey, the wind speeds and directions are both averaged over the hour up to the time of observation. However, for European stations wind speeds and directions are both averaged over a 10-minute period up to the time of observation.
- Wind speeds are in Kt. Wind directions are stored in the database every 10 degrees and have been converted to the nearest point of the compass. These give the direction the wind is blowing from, not to.
- Cloud amounts are in Oktas from 0 (clear) to 8 (overcast). 9 indicates sky obscured (eg by fog).
- Air temperature and dew point temperature are in Celsius.

## Temperature maps

- Daily maximum, minimum and grass minimum temperatures are in Celsius.
- The period for the daily maximum temperature on day D is defined from 0900 UTC day D to 0900 UTC day D+1.
- The period for the daily minimum and grass minimum temperatures on day D is defined as 0900 UTC day D-1 to 0900 UTC day D.
- On any given day D the minimum will typically occur in the early hours of the morning and the maximum in early afternoon.

## Rainfall, sunshine and max gust speed maps

- Daily rainfall is in mm from 0900 UTC day D to 0900 UTC day D+1.
- Daily sunshine is in hours from Kipp and Zonen CSD1 automatic sunshine records. Bright sunshine is defined as exceeding 120 W/m<sup>2</sup>.
- Max gust speeds are the daily max gust in Kt from 0000-0000 UTC

## Snow maps

- The day of snow falling map displays data from present weather sensors, showing stations which have recorded sleet or snow falling at any point in the day (0000-0000 UTC).
- The snow lying map shows level snow depth as recorded by the automatic snow depth sensors at 0900 UTC. These snow depth sensors do not record snow depth if this is less than 2cm.

- Snow depth sensors are normally operational from October to April, in the event of snow falling outside this period data availability may be limited.
- Snow maps will only be displayed if one or more of the selected stations on that date have recorded either snow falling or non-zero snow depths. If snow maps are not displayed it is still possible that other stations in the network have recorded a day of sleet or snow falling or non-zero snow depth.
