Daily Weather Summaries for March 2022

If you have any questions or feedback about this product or wish to obtain further data please contact the Met Office.

This document contains daily weather summaries for each day of March 2022. The Met Office National Meteorological Library and Archive holds a continuous record of daily weather summaries or daily weather reports from 1860, and these daily weather summaries form a continuation of that series.

The purpose of each summary is to provide an overview of the weather conditions across the UK on that day, with the historical emphasis mainly based on observations from surface network of weather stations, although the format has varied over the decades. While the emphasis remains on observations from the surface network, the current daily weather summaries supplement these by including satellite and rain-radar imagery to provide a more complete overview. The current format of the daily weather summaries is as follows:

1. Text summary of the main characteristics of the weather during the day, written by an operational meteorologist in the Met Office operations centre.
2. Table of daily extremes for the UK for key climate variables including temperature, rainfall, sunshine and gust speeds.
3. Overview of the synoptic situation at 00 and 12 UTC comprising: analysis charts showing the surface pressure pattern and associated weather fronts; North Atlantic and European infra-red satellite images showing cloud-cover; combined infra-red and rain-radar images of the UK; maps of wind speed and direction at 00 and 12 UTC; observations of pressure, wind speed and direction, cloud cover, air and dewpoint temperature at selected UK and European stations in data tables.
4. UK maps of key climate variables from observing stations including maximum, minimum and grass minimum temperature, rainfall, sunshine, gust speed and snow.
5. Further guidance notes

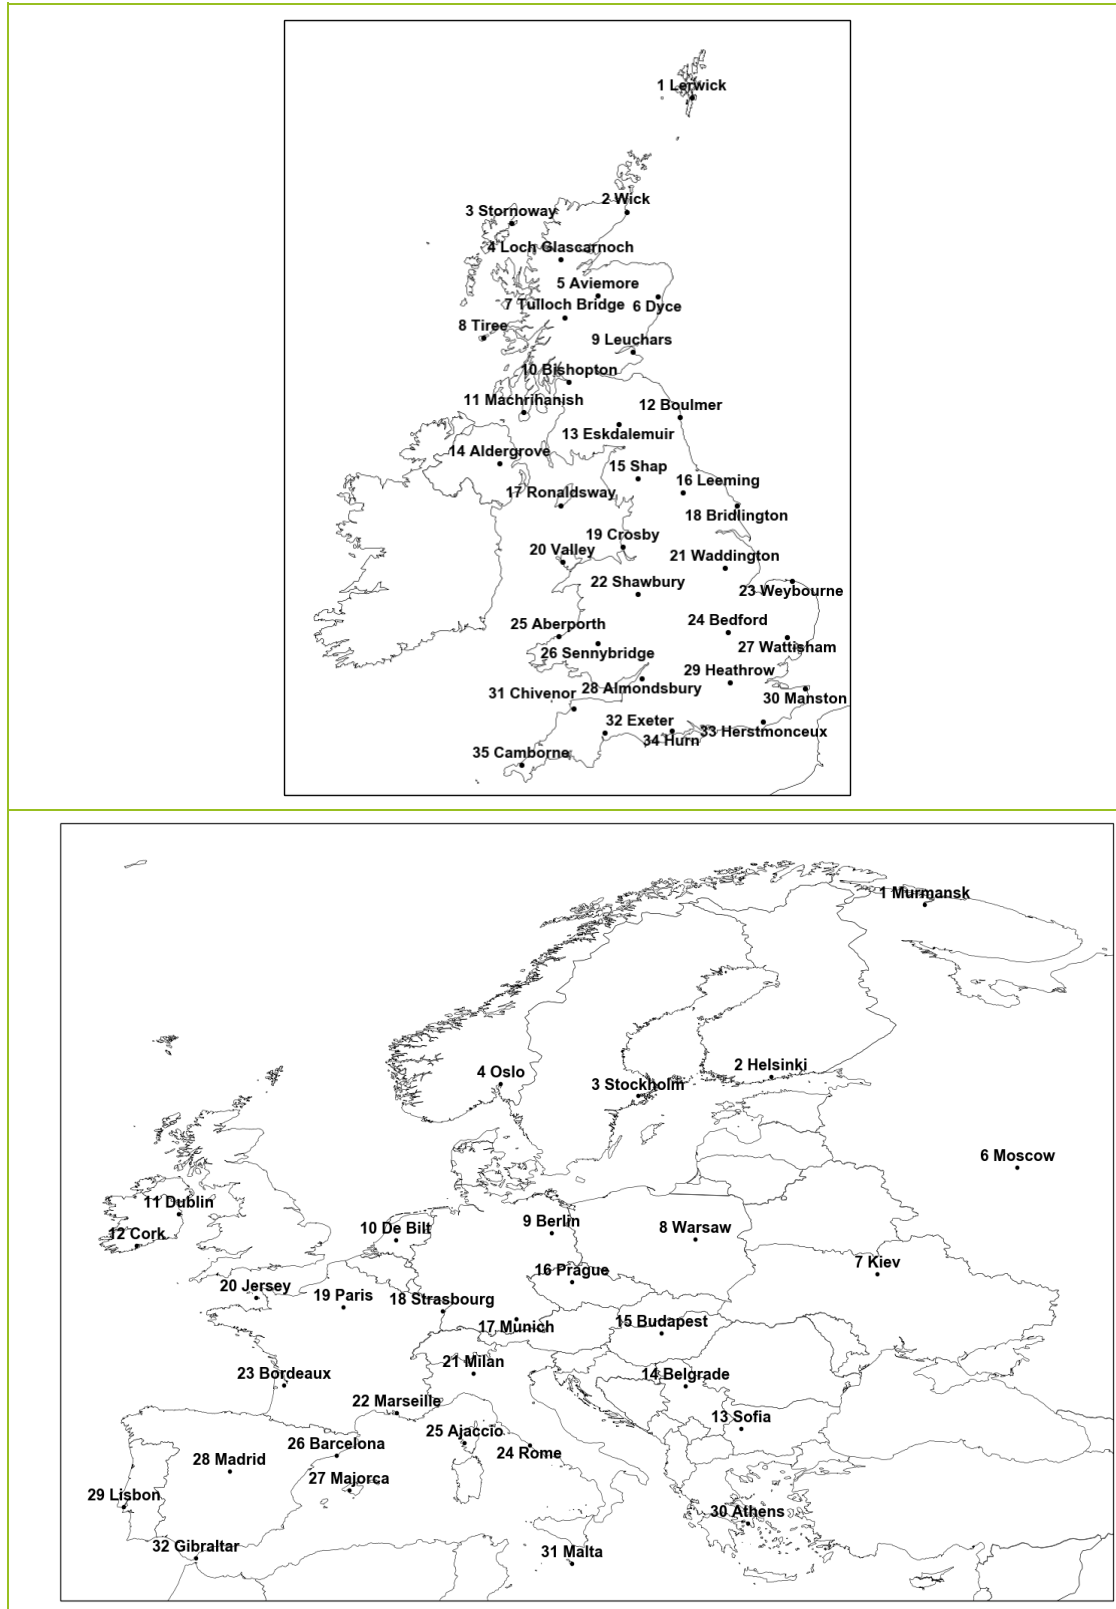

If you spot any data errors or omissions in this product please contact the Met Office.

Daily Weather Summary for Tuesday 01 March 2022

This day's summary created 08/03/2022 03:03

Summary of the UK Weather for Tuesday 01 March 2022

As an area of high pressure built in across central and northern areas of the UK, clear skies in Northern Ireland, Scotland and Northern England led to a cold night with a frost. Some showers affected western Scotland and the Northern Isles however, turning to snow over the mountains. Further south across England and Wales it was much cloudier, due to a slow-moving weather front, which brought light rain and drizzle across SE England through the early hours. The low pressure system continued to move northeastward through the day lingering for a time in the southwest of the UK. This brought some persistent and at times rather heavy rain to much of Cornwall and Devon and then along the south coast later in the day; before finally pushing into the southeast and Wales. Cloud thickened ahead of the rain bringing cloudy conditions to much of the south and the Midlands as well as Wales. Further north and across Northern Ireland experienced a much brighter day with clear skies and sunny spells with some isolated showers across western Scotland.

Summary of the UK Weather for Wednesday 02 March 2022

There was a clear north-south divide in the weather through the early hours of Wednesday. Southern counties saw continued drizzle and rain whilst the north of the UK stayed dry with some clear spells which made for a cooler night. Fog patches developed within these clearer areas. Rainfall across the south did ease through the morning whilst pushing slightly northward and winds remained generally calm throughout. The north-south divide continued through the first half of the day with the frontal system continuing to push northwestward through the day bringing some heavy rain to parts of North Wales and light rain and drizzle to much of the south of the UK. By midday the rain pushed into the north of the UK, Northern Ireland and eventually into Scotland, with some locally heavy and persistent rain. Wales and southwest England experienced some drier conditions before a second band of frontal rain pushed in from the southwest making landfall in Cornwall at nightfall.

Summary of the UK Weather for Thursday 03 March 2022

A mild and cloudy start to Thursday with areas of rain and drizzle. Heaviest rainfall was in western and northern parts, mainly Scotland and north Wales. This rain slowly moved northeastwards through the early hours with much of the west coast of the UK experiencing rainfall by dawn whilst eastern parts remained dry. Winds were also strongest in northern and western areas. Trailing occluded fronts slowly pushed eastwards through the rest of the day, bringing showers to western areas at first, particularly Wales. This rain then continued to spread across northern England and Scotland during the afternoon. Alongside this rain, cloud could be seen for most, with few sunny spells. This band of rain and cloud continued to gently move eastwards through the evening, covering locations in Scotland and England by the end of the night. Some heavier bursts of rain were seen at times, with clearer conditions following behind the front in the west and southwest.

Summary of the UK Weather for Friday 04 March 2022

Conditions remained constant through the night with an occluded front extending through the centre of the UK from Scotland to the southern coast. This brought heavy rain from northeastern England to the midlands. Away from the heavy rain, many parts of Scotland and down into the south of England, experienced drizzle through the night. Away from the front in western Scotland, Northern Ireland, Wales and the southwest saw predominantly dry and clear conditions. Rain in the south coast eased through the early hours as the front slowly moved east. The occluded front across the UK continued to dominate the synoptic situation through the rest of the day. This slow-moving feature continued to travel eastwards, pushing the band of rain with it. Elsewhere saw mostly dry conditions with patchy cloud. Scattered showers followed behind the front, which led to optimum conditions for a rainbow to be formed over the town of Glossop during sunset. Into the evening, cloud and outbreaks of rain lingered across eastern England and elsewhere saw any residual showers fading and widespread frost in northern and western locations.

Summary of the UK Weather for Saturday 05 March 2022

A weather front brought cloud and outbreaks of rain to the east and southeast of England overnight. The rest of the UK experienced a dry night with some clear spells, which allowed a fairly widespread frost to form. As dawn approached the wettest conditions became confined to southeastern England, with a scattering of showers on North Yorkshire coastlines. Winds remained light through the night. It was a rather cold night for many with the coldest temperatures experienced under clear conditions. The occluded front continued to pass over central and eastern locations of the country, bringing patchy rain to southeastern parts of England and the odd shower again to North Yorkshire and parts of the east coast. Winds remained light though sometimes gusty near the eastern coasts. Elsewhere remained dry with patchy cloud and sunshine.

This day's summary created 13/03/2022 03:03

Summary of the UK Weather for Sunday 06 March 2022

A high pressure system slowly pushed further inland from the west, causing an occluded front to travel southwards. Due to the front's location across southeastern areas, there were light showers for some which dissipated through the small hours. However, for most it was a rather benign start to Sunday, with dry conditions and variable cloud amounts. It felt much cooler under clear skies. High pressure continued to dominate throughout the day. Remnants of the occluded front swept over the south and southeast of England, bringing few showers to these parts throughout the morning. Once this passed, the day was largely dry with variable amounts of cloud. Strong winds were experienced in the far southeastern and northwestern areas, especially along coasts.

This day's summary created 14/03/2022 03:03

Summary of the UK Weather for Monday 07 March 2022

The week was welcomed with settled conditions, as a high pressure centre lay across the UK. Variable cloud amounts and light winds led to some areas receiving a frost, particularly northern England and southern Scotland. It remained dry for most, with only a few isolated areas in the southeast receiving a light shower. It was a largely dry day for most with variable amounts of cloud leading to some sunny spells. There were a few light showers over the southeast to start the day but these quickly cleared away. The best of the sunny spells during the morning were across Scotland and Northern Ireland. By late afternoon the cloud was confined to central and northern England resulting in sunny spells across southern England and Wales. The strongest winds were along the southwest and western coasts.

Summary of the UK Weather for Tuesday 08 March 2022

Overnight, high pressure once again dominated the UK, leaving a dry night for all. Variable cloud was experienced over northern and western areas, though it was generally a clear night for the southeast and central England. Strong winds were experienced along the northeastern coasts of Scotland, the Highlands and Bristol channel. Through the small hours, light rain was experienced in the far southwest, bringing a further band of rain to southwestern Ireland and some light showers to western Cornwall. High pressure sat to the east of the UK, giving in a largely dry morning with sunny spells for most. A cold front associated with low pressure reached the southwest and south Wales by midday bringing showers to these areas. The front progressed eastwards through the afternoon resulting in rain affecting Northern Ireland and the west of the country, the heaviest rain across western Scotland. Elsewhere was dry with sunny spells. It was a windy day for many, with the strongest gusts along western coasts and Northern Ireland.

Daily Weather Summary for Wednesday 09 March 2022

This day's summary created 16/03/2022 03:03

Summary of the UK Weather for Wednesday 09 March 2022

The early hours started with a decaying cold front positioned across the country resulting in a cloudy start to eastern Scotland and the southeast. An occluded front moved into western Scotland during the early hours which brought locally heavy rain. Elsewhere remained dry throughout with variable amounts of cloud. Winds began to increase along the west coast towards dawn, specifically in the Hebrides. Into the morning, a band of persistent rain moved in from the west across western Scotland and Northern Ireland, elsewhere it was mostly cloudy and dry, with the brightest and clearest conditions to the east and southeast. The band of rain reached Wales and western England in the afternoon as it continued to push northeastwards through the morning. Eastern and southeastern England remained dry with variable cloud. The cloudy and rainy conditions remained into the night for parts in Scotland, Northern Ireland, Wales, northern and southwestern England. Eastern and southeastern England continued to remain dry and saw clear spells at times through the evening. It was a mild day for most with the southerly winds.

This day's summary created 17/03/2022 03:03

Summary of the UK Weather for Thursday 10 March 2022

A low pressure centre sat to the southwest of the UK during the early hours. A waving warm front extended from the southwest to the northeast. This front brought rain to southwest, central and northeast Scotland during the small hours which largely cleared by dawn. A cold and occluded front brought showers to the southwest initially and then southeast by dawn. Elsewhere remained largely dry with variable amounts of cloud. Into the day, the waving frontal system set the main theme and split the UK into three sectors, with mostly clear and dry conditions in the east and west, sandwiching central UK with a wide band of cloud and patches of rain. Western Scotland, eastern Northern Ireland, Wales, southwestern England and southeastern England saw a few patches of showers through the morning. In the afternoon, showers continued in Scotland while Wales and southwest England saw fewer. The east and southeast experienced a dry and bright afternoon. Into the evening, the cloud and patchy rain continued covering the central parts giving a dry night to the east and west.

Summary of the UK Weather for Friday 11 March 2022

It was a largely cloudy start to the day for most of the country as the waving front remained over the UK. There were showers across Northern Ireland, central and southern Scotland, northwest England and Wales during the early hours. A low pressure system was situated to the west and reached the southwest by dawn. This brought a band of locally heavy rain to the southwest and south Wales towards dawn. Elsewhere remained largely dry but cloudy. After a sunny start along eastern coastlines, it quickly clouded over as a band of rain moved northwards. The rain was heavy at times, particularly in the southwest and over the hills. Strong winds accompanied the rain and were also experienced ahead of it, with gusts of 40-50 mph in exposed places. Through the afternoon, clearing skies arrived in the southwest, but with some heavy showers. The Northern Isles remained dry and fine throughout the day. Into the evening, the rain continued moving north, with showers following on behind.

Summary of the UK Weather for Saturday 12 March 2022

An area of low pressure developed rapidly in the Atlantic since the start of the day. Ahead of this, most of the UK experienced a wet night with variable cloud. There were plenty of showers moving northeastwards across the country through the early hours with more persistent rain developing in Scotland. Parts of Wales, the Midlands, East Anglia and southern England saw a dry period before dawn, but the southern coastlines remained showery. As one spell of rain slowly moved northeast away from Scotland through the afternoon, a brief window of better weather followed, but still with some showers. However, the next spell of rain, associated with a rather deep area of low pressure, arrived in to the far southwest around lunchtime, this rain affected larger parts of southwest England, Wales, and Northern Ireland by dusk. Strong winds accompanied this, with a gust of 73 mph on the Isles of Scilly. Into the evening, the rain and strong winds continued moving north, with the intensity slightly eased through the night.

Summary of the UK Weather for Sunday 13 March 2022

An area of low pressure at the west of the UK dominated the weather. Its centre slowly pushed north, approaching Northern Ireland through the early hours. This brought wet and windy weather with variable cloud to the western and central parts of the UK as the associated fronts swept northeastwards. To the east of these, southeastern England, East Anglia and the eastern coastlines remained dry with mostly clear skies through the night. The low pressure system continued to dominate the weather in the UK as it slowly tracked to the north. Many areas experienced periods of showers through the day, particularly Wales, southwest England, Northern Ireland and Scotland. Between these showers there was the occasional sunny spell, but most areas remained covered in cloud throughout the day. The southeast of England saw more persistent rain, as well occasional spells of hail. It was fairly breezy throughout the country, particularly in northern areas. As midnight approached most of the rain and showers ceased, leaving largely dry but cloudy conditions.

This day's summary created 29/03/2022 10:15

Summary of the UK Weather for Monday 14 March 2022

Many parts were clear to start Monday morning as the previous day's showers died away, and as a result there was a widespread frost, and a few isolated fog patches. However, there were a few exceptions to this. The first was in Northern Ireland, as the wrap-around occlusion from the low pressure centre returned, bringing a spell of rain to all by dawn. Secondly, the far east of East Anglia was cloudier with some rain clearing through the early hours. Some showers also grazed along the south coast. After a cold start for many, a lot of areas experienced fine and dry conditions through the day with mild temperatures. There was the occasional shower in the far southeast, as well as a more organised frontal system which made its way west across Northern Ireland, northern Wales, northern England and Scotland, bringing persistent rainfall. Moving into the evening, the frontal system cleared the east coast, leaving behind a dry and largely clear night, although it was cloudy in some coastal areas.

Summary of the UK Weather for Tuesday 15 March 2022

A band of rain on an approaching occlusion moved into northwest Scotland and Northern Ireland through the early hours. Apart from some rain moving through the south Midlands and East Anglia associated with another occlusion, it was a dry and clear night elsewhere. A frost formed as a result, and there was some patchy fog observed. Winds were light, apart from in northwest Scotland, where it became quite windy with gusts of around 40 mph. Early fog patches cleared through the morning resulting in sunny spells for many, especially over England and Wales, which felt warm. Cloudier for Scotland and Northern Ireland where more persistent rain was seen in western parts. This rain gradually progressed south-eastward and weakened into the night.

Summary of the UK Weather for Wednesday 16 March 2022

An occlusion has sat over the UK through the morning bringing persistent rain to areas of Scotland, Wales and Northern Ireland. The rest of the country remained cloudy, but largely dry. Southern areas were mild, whilst northern areas were more on the cooler side, particularly under any precipitation. Winds remained fairly light through the morning, allowing for mist and fog patches to form in many areas by dawn. A sizable band of rain crossed the UK throughout the morning and into the afternoon, with heaviest rainfall in the south of England. This rain cleared eastward throughout the late afternoon and any residual showers in the far northwest died out through the evening. Clear spells for many followed which allowed a widespread frost and fog patches to form.

Summary of the UK Weather for Thursday 17 March 2022

Ahead of an early morning frontal system was a large bank of cloud and as well as an organised band of rain which ended up easing over the North Sea. Clear skies followed once the fronts passed leaving most of the country with fine and dry conditions by dawn, apart from Northern Ireland which saw some precipitation. There was clear and dry to start the day, with the most of any cloud in the west. A band of rain sat on the edge of the west coast of Scotland and east coast of Northern Ireland, which moved eastwards through the morning. Another band of rain formed behind it, which was locally heavy and passed east around midday. Showers then affected Scotland and Northern Ireland, through the rest of the day, as well as some light showers for Wales and the southwest. Patchy cloud spread eastwards through the day, with the far east remaining clear. The showers eased and the cloud cleared for most through the evening.

This day's summary created 29/03/2022 10:07

Summary of the UK Weather for Friday 18 March 2022

A dry start to Friday with any residual showers in the North fading. Areas of low cloud formed across the UK which lead to fog patches forming through the early hours. A yellow weather warning was in force for parts of southern and central England and Wales for fog. There was still plenty of clear skies which lead to frost forming in these areas. High pressure dominated, leading to a fine and dry day for most. The fog affecting parts of central and southern England and Wales lifted to low cloud through the morning and cleared. Patchy cloud bubbled up in central and southeastern areas through the afternoon. A little light rain affected the far north for a time through the morning. Cloud affecting Scotland lasted through the day. The evening was clear and dry for most, with Scotland remaining cloudy. The northwest and Irish Sea coasts were windy at times.

Summary of the UK Weather for Saturday 19 March 2022

A dry and settled start to the weekend as high pressure continued across the UK. Patchy low cloud and mist in areas, particularly around Northern Ireland, although most places saw clear periods allowing for a touch of frost in places. Some fog patches formed through the early hours, particularly in the northeast. Relatively breezy in the south. High pressure continued to dominate throughout the day, bringing clear skies and fine weather for most, with patchy cloud lingering for Scotland and far southwestern England. Winds remained stronger around the edge of the high, particularly towards Devon and Cornwall, and coastal areas around the Irish Sea and west Scotland. Feeling pleasantly warm for most.

Summary of the UK Weather for Sunday 20 March 2022

High pressure continued to dominate through the early morning, with the majority of the country seeing clear skies, and temperatures low underneath them. Winds were brisk, especially in coastal areas and in the northwest, though lighter than previously. The far southwest and parts of Northern Ireland experienced patchy cloud through the morning due to a weak weather front skirting the high pressure, and patchy mist was also present in Cornwall and far northeast England along the coast. Throughout the morning, most of the UK experienced clear and fine conditions, with mist lingering in Cornwall, and patchy cloud bubbling up, mainly along the east coast. Patchy rain began to creep over Northern Ireland and the far east of England into the afternoon with the majority of the UK staying fine and dry. Winds remained strong along the southwestern coasts, elsewhere becoming lighter than previous days. Feeling warm in the sunshine for most. Towards the evening, frontal rain moved further into Northern Ireland and the Hebrides.

Summary of the UK Weather for Monday 21 March 2022

An area of low pressure sat off the east coast in the North Sea through the morning, with an occluded front wrapped around it. This moved north through the morning, staying mostly offshore. The majority of the country stayed cloud free for most of the night, while the southwest and west Wales saw cloudy conditions, with some light rain, that spread northeastwards. Under the clear skies, fog formed for many areas, particularly in the east, and it was cold. The day remained fairly cloudy but bright for many with the best sunshine across central Scotland and northeast and eastern England. There were some isolated spots of rain in Northern Ireland, Wales, western Scotland and western England but mostly dry elsewhere. It was breezy around southwest coasts. Temperatures were cooler than previous days, but still pleasant in the sunshine.

Summary of the UK Weather for Tuesday 22 March 2022

Northern Wales experienced showers throughout the night, with scattered showers appearing over Northern Ireland, Scotland and northern England towards dawn. By sunrise the southwest was experiencing prolonged showers. Patchy cloud covered the UK, with the clearest skies along the east. There was widespread mist in the early hours, and winds remained light for most, stronger in the southwest, particularly coastal Wales. Variable cloud and sunny spells covered most areas, making it feel warm in the sunshine. Most places remained dry but there were some isolated showers in the south during the morning, progressing to heavier showers in parts of the Midlands, northern England and southern Scotland by the afternoon. Throughout the evening the remaining showers dissipated, leaving dry conditions with clear spells for many. There were a few fog patches, particularly in east and northeastern England.

Summary of the UK Weather for Wednesday 23 March 2022

High pressure to the northeast of the UK continues to dominate the weather. Scattered showers were sporadic throughout the night, mainly over northern UK. Clear skies and dry conditions were experienced by most, alongside light winds. Mist was widespread towards dawn, with isolated fog patches in eastern areas. Temperatures remained warm overnight, with the cooler temperatures restricted to higher ground. During the day, the UK remained dry and settled with clear skies being seen in most places. The showers in the north eased and the fog patches in the east slowly lifted through the morning. Moving into the afternoon, UK experienced a dry, sunny and warm afternoon as clear skies remained in most places, apart from far north and east, where northern Scotland saw isolated light showers and it was hazy in the east. Into the evening, skies remained clear for most as the east continued to be hazy. Northern Ireland and far western Scotland turned cloudier later towards the end of the day.

Summary of the UK Weather for Thursday 24 March 2022

High pressure to the east dominated the weather overnight, bringing clear skies for most, allowing frost and a few fog patches to form later in the night. Throughout the night, skies turned cloudier in the far northwest, sometimes bringing a little light rain in places. During the morning, a few patches of drizzle were seen in northern Scotland as the fronts passed. In the east, the skies became hazy after the mist and fog patches cleared. Elsewhere in the south and west, skies were mostly clear. In the afternoon, as the drizzle in northern Scotland eased, it was mostly dry across the UK, apart from northwestern England and southern Scotland, where there was some light rain. The south remained sunny with clear skies and the haze slowly clear towards the eastern coastline into the evening. Through the evening, skies remained rather cloudy in the northwest, but stayed mostly clear elsewhere.

Summary of the UK Weather for Friday 25 March 2022

High pressure once again dominated the weather, bringing calm and dry conditions for most. It was a generally clear night for much of the UK, although with some areas of cloud for Northern Ireland, northern England, north Wales and northern Scotland; this may have given the odd spot of light rain. Under the largely clear skies mist and fog patches formed, as well as an isolated air frost. Any mist and fog soon cleared after sunrise. A rather benign day then ensued with the calm, dry weather continuing, giving some long sunny spells and a little fair weather cloud. Daytime temperatures were broadly above average for the time of year. Into the evening, it became rather cloudy for parts of the far north and northwest, alongside some light rain and drizzle across Northern Isles. It remained fine and mainly clear elsewhere.

Summary of the UK Weather for Saturday 26 March 2022

High pressure dominated the weather again, giving dry and calm conditions to most places in the UK. During the early hours, clear skies were seen in many places, except northern Scotland, Northern Ireland and parts of the eastern coastline of England, where it was cloudier with occasional light rain in the far north and hazy in other areas. Towards dawn, mist and fog patches formed over Northern Ireland, the west Midlands, eastern and southern England. Beside the mist and fog patches, the south and east remained hazy and the far north stayed cloudy. Elsewhere skies remained clear. The calm theme continued throughout the day. It remained dry across the UK, with varied cloud amounts. It was sunny for most; however, cloudier conditions affected northern England and southern Scotland later in the day. The highest temperatures for the day were seen across Wales and the northwest of England. It remained largely clear heading into the evening. Thus, temperatures dipped sharply following sunset. However, patchy cloud spread across northern and later easternmost areas from the North Sea.

Summary of the UK Weather for Sunday 27 March 2022

High pressure continued to dominate the weather across most parts of the UK. During the early morning, clear skies were seen in many places across Scotland, Northern Ireland, Wales, and the western half of England, while low cloud slowly spread across eastern England from the North Sea. Mist and fog patches also formed in Scotland, the Midlands, and northern, eastern and southeastern England from the small hours through to dawn. Some areas in southwestern England also turned hazy before sunrise. Winds were slack for most, apart from Shetland. Towards sunrise, there were very few scattered showers over the UK before clearing up and remaining dry throughout the day. Widespread mist and fog was also slow to clear throughout the morning. Thereafter, cloud began to move in, with southwest England, Scotland and Northern Ireland keeping clear skies. Winds remained light, though strengthening slightly on the southwest coast. Similar to previous days, it felt pleasant in the sunshine, with temperatures in the high teens.

Summary of the UK Weather for Monday 28 March 2022

The week began with a high pressure system dominating the synoptic situation across the UK. Most areas were dry and cloudy, however isolated showers built towards the northwest of England through the small hours. Though isolated in nature, the area these showers occupied increased, whereby areas of eastern England also received a drop of rain at times. Fog and mist were present in the early hours, mainly in coastal areas. Throughout the morning the showers built into a band of showery rain across northern and northeastern England, and southern Scotland. Another small band of showery rain approached the southwest towards noon, moving northeast across the UK and reaching southeast England by mid-afternoon. Elsewhere experienced dry conditions, with patchy cloud coverage. Northern Ireland and central England had the clearest skies. High pressure brought light winds, with most areas feeling pleasant in the sunshine.

Summary of the UK Weather for Tuesday 29 March 2022

Multiple low pressure centres were situated away from the UK; one being over the Atlantic, one being over France and one over northeastern Europe. These systems influenced the weather across the UK heading into Tuesday. A set of decaying cold fronts lingered through the small hours, bringing a small patch of showers to the far north of Scotland. A few troughs associated with the low pressure over France brought frequent showers to southern England. Elsewhere was dry with variable cloud amounts. These fronts continued to move southwards through the day, bringing patchy light rain and drizzle to much of the UK, with the most widespread rain in parts of the south coast and parts of Scotland. These wet conditions continued to move southward through the day. Parts of the midlands and wales experienced a mostly dry day with some good sunny spells. This allowed some rather warm temperatures through the day.

Summary of the UK Weather for Wednesday 30 March 2022

A cold front travelled south over the UK throughout the night, bringing heavy showers, some wintry in nature, to most parts. Wales and southwest England experienced prolonged clear spells and remained dry. Towards dawn there was widespread mist and fog, however winds remained light and temperatures mild outside of Scotland. Unsettled conditions continued to move southward through the day as the cold front tracked towards the south coast. This cold front brought light rain and drizzle, followed by further showers across the UK, some locally heavy and wintry at times across Scotland and the north of the UK. The south of the UK experienced some brighter and sunny spells through the morning before a thick band of frontal cloud pushed across the region. Through the afternoon and into the evening showers became rather heavy and thundery at times.

Summary of the UK Weather for Thursday 31 March 2022

A set of cold fronts continued to move southwestward across the UK throughout the night, bringing frontal rain bands to southern areas which cleared the UK by dawn. Behind these cold fronts were clear skies and dry conditions, mainly in Wales and the Midlands, and further behind the fronts were scattered showers over eastern Scotland and northeastern England. These showers were wintry in nature, and there was widespread frost as temperatures dropped compared to previous days. Northeast England also experienced thundery showers throughout the night. Wintry showers were scattered throughout the day as cold Arctic Maritime air continued to push southwards, affecting primarily western Scotland, northeast England and parts of Wales before moving to more southern parts. Snow accumulations increased over higher ground in Scotland and northern parts. Winds were strong on the southeastern coast of the UK, elsewhere experienced light winds.

Daily Weather Summary for Thursday 31 March 2022

Daily Weather Summary for Thursday 31 March 2022

Guidance Notes

UTC = Universal Coordinated Time. For the UK UTC is the same as GMT (Greenwich Mean Time).

National boundaries shown on the European station map are for illustrative purposes only.

Daily extremes

- Daily extremes have been manually confirmed by Met Office Observations Quality Management as valid observations from the live database at the time of checking. However, more extreme values may still be possible if they occur after the time of production.
- Mountain stations above 500 masl are excluded from lowest temperatures, highest gust speeds and greatest snow depths at 0900 UTC. This is because they are not considered representative of low level areas.
- Counties quoted against each station are based on historical county boundaries pre-1974 and may not reflect current administrative boundaries.

Analysis charts and satellite imagery

- The satellite imagery is infra-red imagery from the geostationary MSG satellite.
- The rainfall image is derived from satellite data from MSG and rain-radar data. This represents a snapshot of instantaneous rain-rates at 0000 UTC and 1200 UTC and so does not necessarily reflect daily accumulations in the rainfall station map.
- Any analysis charts or satellite images which are unavailable will be displayed as white space.

Station maps

- The UK maps show station data for the same set of stations presented UK data table. These stations are selected to provide good spatial coverage across the UK; they represent only a fraction of the overall UK observing network.
- Wind speed maps show wind speed in Kt and direction both averaged over the hour up to the time of observation. 1 Kt = 1.151 mph.

Hourly station data

- The data tables provide spot hourly observations from synoptic messages at 0000 and 1200 UTC. Missing data are denoted by '-'.

- Pressures are mean sea level pressure in hPa.
- For UK stations, Gibraltar and Jersey, the wind speeds and directions are both averaged over the hour up to the time of observation. However, for European stations wind speeds and directions are both averaged over a 10-minute period up to the time of observation.
- Wind speeds are in Kt. Wind directions are stored in the database every 10 degrees and have been converted to the nearest point of the compass. These give the direction the wind is blowing from, not to.
- Cloud amounts are in Oktas from 0 (clear) to 8 (overcast). 9 indicates sky obscured (eg by fog).
- Air temperature and dew point temperature are in Celsius.

Temperature maps

- Daily maximum, minimum and grass minimum temperatures are in Celsius.
- The period for the daily maximum temperature on day D is defined from 0900 UTC day D to 0900 UTC day D+1.
- The period for the daily minimum and grass minimum temperatures on day D is defined as 0900 UTC day D-1 to 0900 UTC day D.
- On any given day D the minimum will typically occur in the early hours of the morning and the maximum in early afternoon.

Rainfall, sunshine and max gust speed maps

- Daily rainfall is in mm from 0900 UTC day D to 0900 UTC day D+1.
- Daily sunshine is in hours from Kipp and Zonen CSD1 automatic sunshine records. Bright sunshine is defined as exceeding 120 W/m².
- Max gust speeds are the daily max gust in Kt from 0000-0000 UTC

Snow maps

- The day of snow falling map displays data from present weather sensors, showing stations which have recorded sleet or snow falling at any point in the day (0000-0000 UTC).
- The snow lying map shows level snow depth as recorded by the automatic snow depth sensors at 0900 UTC. These snow depth sensors do not record snow depth if this is less than 1cm.
- Snow depth sensors are normally operational from October to April, in the event of snow falling outside this period data availability may be limited.
- Snow maps will only be displayed if one or more of the selected stations on that date have recorded either snow falling or non-zero snow depths. If snow maps are not

displayed it is still possible that other stations in the network have recorded a day of sleet or snow falling or non-zero snow depth.
