Understanding the Outlook

The Outlook uses 3 categories for possible UK temperature, precipitation and wind speed in the next 1 and 3 months:

COOL, NEAR AVERAGE and WARM for temperature
 WET, NEAR AVERAGE and DRY for precipitation
 CALM, NEAR AVERAGE and WINDY for wind speed

These are linked to observed UK conditions in past years. The NEAR AVERAGE category represents typical conditions for the period and has a normal likelihood of 60%. The higher and lower categories represent more unusual conditions that are more likely to produce impacts. Each has a normal likelihood of 20%.

The Outlook shows how the chances of occurrence of the categories differ from normal, based on knowledge of expected global meteorological patterns. It does not identify which category will actually occur.

Same 3-month period over the last 10 years

2013	2014	2015	2016	2017	2018	2019	2020	2021	2022

NEAR AVERAGE	CALM	CALM	NEAR AVERAGE	NEAR AVERAGE	WINDY	NEAR AVERAGE	NEAR AVERAGE	CALM	NEAR AVERAGE

Outlook in context

Drivers of UK weather for September to November

The impact of global weather patterns on the UK is small through this period. Drivers relevant to the current Outlook are:

- The warming of UK climate consistent with wider global warming trends
- El Niño continues to develop in the Pacific Ocean. Impacts on the UK, through most of the period, are small. However, in late-autumn El Niño increases the chance of westerly winds affecting the UK.
- Sea-surface temperatures around the UK are slightly above average, favouring above average land temperatures.
- Atlantic Tropical Cyclones – the season usually peaks in September and is forecast to have above average activity, this acting to reduce confidence in the forecast.

Long-range weather predictions

The Met Office and other prediction centres around the world routinely produce long-range predictions of conditions in the months ahead. Predictability is typically lower at this time of year, reflected by only weak signals in current model output. The main signals for September and the autumn as a whole, is an increased chance of higher than normal pressure across northern Europe and lower than normal pressure across western and southern Europe, leading to a reduction in the likelihood of westerly winds affecting the UK.

Impact

An increased chance of warm conditions through September to November is consistent with higher than average sea surface temperatures and our warming climate. There is no strong indication for UK-wide rainfall to vary significantly from normal over the next three months. Wetter spells of weather are possible at times, especially later in the season. Given the reduced chance of westerly winds prevailing, the likelihood of impacts from strong winds is decreased compared to a typical autumn. However, this doesn't preclude the chance of stormy spells at times.

3-month	1-month	About the Outlook	Shifts in likelihood	What is average?	Q&A	Find out more
-------------------------	-------------------------	-----------------------------------	--------------------------------------	----------------------------------	-------------------------	-------------------------------

Outlook compared to normal likelihood

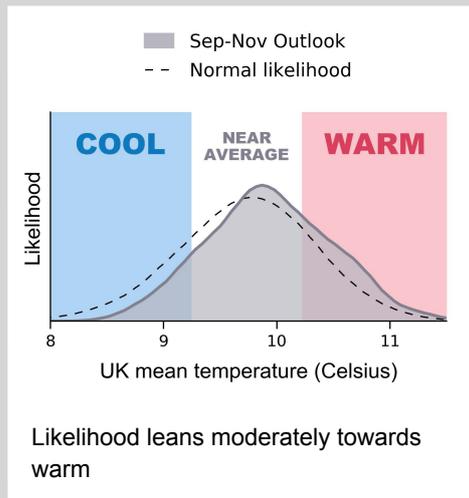

The curves below show the likelihood of the 1- and 3-month average temperature, precipitation and wind speed taking specific values. In each case:

- The dashed curve shows the normal likelihood based on how often each value has been recorded in past years
- The solid curve shows the current likelihood based on the Outlook for this year

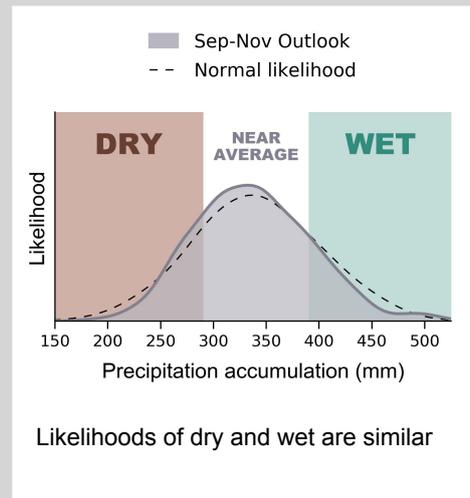

The differences in these curves show how the probabilities for the coming periods differ compared to past years. Where the solid curve (corresponding to this year's Outlook) lies above the dashed curve (normal likelihood), the temperature, precipitation or wind speed at that point has a greater-than-normal likelihood of occurring. Likewise, wherever it is below the dashed curve, the likelihood of those values is less than normal.

A shift of the solid curve to the left of the dashed curve indicates an increase in the chances of below-average temperature, rainfall or winds. A shift to the right, meanwhile, indicates increased chances of above-average values.

Q&As

Q. What is the point of the Outlook, who is it meant for?

A. This Outlook is produced for planners in government and business who make risk-based decisions. These users are aware of the complexities of this type of outlook and will include those factors in their decision-making process.

Q. How did you decide on the Outlook? What are the main factors affecting it?

A. It is based on information from observations, several numerical prediction systems and expert judgement. See the 'Outlook in Context' section of the Outlook for more details.

Q. Is the Outlook for the whole country?

A. The Outlook is for the average of conditions over the UK as a whole. Regional deviations from the UK-average can occur. For example, average UK precipitation can result from below-average rainfall for the northwest and above-average for the southeast.

Q. How confident are you in this Outlook?

A. The percentages in the 'Likelihood of Impact' sections of the Outlook give the level of confidence.

Q. With the increased chance of warmer than normal conditions this Autumn does this mean we might finally see some hot weather?

A. The Outlook is not a guarantee of prolonged warm weather. Higher-than-average overall temperatures could just as easily be due to a mix of warm and cool days, warm nights, or less extreme levels of warmth. Even with above average temperatures it could still be cloudy, wet or windy. Furthermore, there still remains a chance of cooler-than-average conditions for the season overall and shorter spells of cooler or warmer weather are quite likely just through normal fluctuations within the season.

Q. With the Outlook suggesting a reduced chance of windy conditions, will autumn be less stormy than normal?

A. Although the Outlook suggests a reduction in the chance of windy conditions overall, this doesn't preclude the possibility of a windy autumn, nor the chance of stormy spells at times within the season. The Outlook does not predict the number of named storms, as the naming of storms is based on likely impacts, which can depend on factors such as the track of the storm and its time of arrival. This level of detail is beyond the scope of the 3-month outlook, and indications on prospects for storms should be sought from our shorter-range forecasts.

Q. What impact will El Niño have on the weather this autumn?

A. In general, the association between El Niño and UK weather is fairly weak. The UK is a long way from the tropical Pacific and it is only one of a number of factors that forecasters will take into account when assessing the forecast. Generally speaking, past El Niño events have tended to favour wetter and windier conditions for the UK in late autumn and early winter, although the effect is relatively easily disrupted by other factors in any given year.

About the Outlook

The Outlook presented here is for United Kingdom as a whole and is based on information from observations, several numerical prediction systems and expert judgement. It is updated monthly to reflect the latest information on global weather patterns and their effect on the UK. The Outlook is designed to be used in conjunction with shorter-range forecasts – detailed weather forecast information is available on the Met Office website.

In this product, temperature refers to the average of daytime maxima and night-time minima. Wind speed refers to the average wind speed at a height of 10 metres. All numerical values relate to averages (temperature, wind speed) or totals (precipitation – rain, sleet, snow and hail) over 1 or 3 months, which are further averaged over the UK land area as a whole. Normal likelihood and long-term averages are established using the period 1991-2020.
