## Daily Weather Summaries for April 2020

**If you have any questions or feedback about this product or wish to obtain further data please contact the Met Office.**

This document contains daily weather summaries for each day of April 2020. The Met Office National Meteorological Library and Archive holds a continuous record of daily weather summaries or daily weather reports from 1860, and these daily weather summaries form a continuation of that series.

The purpose of each summary is to provide an overview of the weather conditions across the UK on that day, with the historical emphasis mainly based on observations from surface network of weather stations, although the format has varied over the decades. While the emphasis remains on observations from the surface network, the current daily weather summaries supplement these by including satellite and rain-radar imagery to provide a more complete overview. The current format of the daily weather summaries is as follows:

1. Text summary of the main characteristics of the weather during the day, written by an operational meteorologist in the Met Office operations centre.
2. Table of daily extremes for the UK for key climate variables including temperature, rainfall, sunshine and gust speeds.
3. Overview of the synoptic situation at 00 and 12 UTC comprising: analysis charts showing the surface pressure pattern and associated weather fronts; North Atlantic and European infra-red satellite images showing cloud-cover; combined infra-red and rain-radar images of the UK; maps of wind speed and direction at 00 and 12 UTC; observations of pressure, wind speed and direction, cloud cover, air and dewpoint temperature at selected UK and European stations in data tables.
4. UK maps of key climate variables from observing stations including maximum, minimum and grass minimum temperature, rainfall, sunshine, gust speed and snow.
5. Further guidance notes

If you spot any data errors or omissions in this product please contact the Met Office.

## Daily Weather Summary for Wednesday 01 April 2020

This day's summary created 08/04/2020 03:00

### Summary of the UK Weather for Wednesday 01 April 2020

Another cloudy night across the UK, with clearer spells towards the south allowing temperatures to drop below freezing. Otherwise mild towards the north. Staying mostly dry, with a few showers over Scotland and Northern Ireland. It was a chilly day for all parts, as a blanket of cloud lay across a great swathe of the UK. Early sunshine in the far south was quickly replaced by the cloud, though conditions were predominantly dry. The exception to this was some outbreaks of rain in northern Scotland and few showers in northern England. Winds were mostly light, although there was a breeze blowing in northern parts.

### Summary of the UK Weather for Thursday 02 April 2020

It was a dry and cloudy night for most. However, there were a few outbreaks of rain across northern Ireland, northern Scotland and northwestern England through the early hours. Through the morning in Scotland, some very cold air was flooding down from the Arctic, which allowed showers to fall as snow down to modest elevations. Elsewhere, was another chilly and mostly dry day, with a lot of patchy cloud around, though much more sunshine than was seen on Wednesday. Wind speeds were fairly strong in Scotland but mostly light elsewhere. The maximum temperature observed was 15.1 Degrees in Gosport, Hampshire.

### Summary of the UK Weather for Friday 03 April 2020

Scattered showers moved across Northern Ireland and Scotland overnight. Elsewhere it was mostly dry and cloudy with some clear spells developing through the early hours. It was a dry and cloudy start in the north of the UK with some sunshine in the far northeast. However, rain, heavy in places, began to move in from west through the morning, the rain mainly affecting Scotland and Northern Ireland with scattered showers across the north of England. In the south it was a dry and cloudy morning with some sunny spells. In the afternoon rain in the north continued further inland across Scotland and into northern parts of England with the rain giving some heavy downpours at times. In Northern Ireland the rain turned patchier and slowly eased. The south saw further dry weather with the cloud breaking giving some long spells of sunshine. Very similar conditions in the evening with cloud and rain in the north, however a few clear spells started to break through. The rain pushed a little further into England but it was dry further south with clear periods.

### Summary of the UK Weather for Saturday 04 April 2020

A mainly dry and cloudy night with clear spells developing, particularly in the east. However, the west of Scotland saw showers throughout the night. Patches of fog developed in the early hours in the south. Any fog were quick to clear through the morning leaving clear skies and plenty of sunshine on offer, particularly in the south of England with cloudier conditions elsewhere. It was mostly dry however with just a few showers in the north of England and Scotland. In the afternoon the south of the UK held on to the dry weather with the cloud breaking up allowing for clear and sunny conditions for many, however some patchy cloud did linger around northern Wales and the Midlands. The north had a cloudy albeit largely dry afternoon with just a few outbreaks of rain in Scotland. It was a breezy day, especially for western and northern areas but on the warm side in the south which had the best of the sunshine. Largely dry conditions continued through the evening with clear skies in the south and cloud clearing in the north to give long clear periods.

### Summary of the UK Weather for Sunday 05 April 2020

The south remained largely dry and clear throughout the night. Clouds moved northwards and cleared from Scotland and the north of England through the early hours. It was calm throughout with a prevailing southeasterly breeze. A day of sunny and bright spells across most of the UK, with the best of the sunshine towards central and eastern areas. It was cloudier towards the west and over Scotland, with this band of cloud becoming thicker and spreading eastwards across the UK through the evening, bringing outbreaks of rain to the west of the UK later on. The southeasterly breeze persisted through the day, with temperatures becoming rather warm under the clear spells, and the highest temperature since late September 2019 was recorded.

### Summary of the UK Weather for Monday 06 April 2020

Overnight was rather mild as a band of rain pushed in from the west and made its way across the country. The rain was heavy in places and was accompanied by strong winds, and gales in the north. The southeast saw clear skies at the start of the night before cloud began to build as the rain arrived. By dawn the rain was over eastern and central parts of England with skies clearing in the southwest and some further rain in Scotland. The wind backed through the morning, turning into a westerly. The band of rain and cloud cleared the east of England by midday. Spells of sunshine followed across the UK, with further showers over the west of the UK. The skies became mostly clear into the evening, with some lightning observed in the English Channel.

### Summary of the UK Weather for Tuesday 07 April 2020

It was a dry night with light winds for the majority of the UK with the far north of Scotland seeing a few outbreaks of rain and strong winds. There were plenty of long clear periods but as the night progressed cloud started to build across the north of the country with clear conditions continuing in the south, although there was the odd mist or fog patch in the southwest. A dry start for most, with thicker cloud across northern England and parts of Scotland. By late morning and into early afternoon, most of the cloud had cleared bringing prolonged spells of sunshine across the UK. It felt warm in the sunshine. Into early evening, cloud and outbreaks of rain pushed across the southwest of the UK and began to fade away after dusk. The far north of Scotland saw some more prolonged rainfall during this time which lingered into the night.

## Daily Weather Summary for Wednesday 08 April 2020

This day's summary created 15/04/2020 03:00

### Summary of the UK Weather for Wednesday 08 April 2020

Most places remained dry throughout the night with clear spells across much of the UK. Scotland saw some showers through the early hours, some of which merged to longer outbreaks of rain. A few showers also fell across southwest England towards dawn. A warm night for most. Today, the majority of the UK escaped the rain completely, apart from Scotland and Northern Ireland - from the frontal zone in the north of the UK. For most, there was a continued theme to the weather with plenty of sunshine, considerably warmer than average temperatures and relatively light winds. South Wales, parts of the northern England and also parts of the South East saw more cloud, often later on.

### Summary of the UK Weather for Friday 10 April 2020

A dry night for most, with clear skies across most areas in the west. Eastern areas were sometimes overcast or partly cloudy. This cloud spread eastwards towards dawn. Winds remained light, barring some breezier conditions along coastlines in the east before another mild night across the UK. The day began with hazy sunshine, with more cloud the further north in the UK, and calm winds. This began to clear through the morning bringing much more widespread sunshine across the south, midlands and Wales, leaving patchy cloud for the rest. In the afternoon showers developed across the higher ground, the Lakes District, Snowdonia and the northwesterly most parts of Scotland. Some lightening was also recorded in these areas before the evening.

### Summary of the UK Weather for Saturday 11 April 2020

Another mild night across the UK, with the south staying dry and clear throughout. The north and northwest of Scotland saw some rain during the first part of the night, which pushed eastwards through the early hours. There was further rain following across southwest Scotland, and the odd outbreak of rain across Lancashire, pushing northeastwards and off the coast of north Yorkshire. There was also some lightning observed here. Northern England and Scotland also saw patches of mist or haze at times. Scotland stayed mostly cloudy throughout the day, and any haze in the north of England cleared through to the late morning. Bright and sunny spells elsewhere. By midday, the west of Scotland and Northern Ireland saw showers spreading eastwards through to the late evening, and some thundery afternoon showers in the southwest of England. For the fourth day in succession, it was the warmest day of the year so far.

### Summary of the UK Weather for Sunday 12 April 2020

Overnight there were some sparse showers in the south, but these cleared eastwards through the early hours, when further light showers reached the far northwest from the coast. There were light winds throughout, and it was rather mild, similar to as of late. Apart from the few showers, it was a largely dry night. Patches of mist and haze formed in the early hours, clearing with the morning sunshine. A cloudy start over Scotland and Northern Ireland, with outbreaks of rain here through the day. Elsewhere was hazier to start, with cloud soon spreading southwards across the UK. A few thunderstorms were observed in the afternoon over northeast Wales, and southeast and central England. Becoming windier throughout the day.

### Summary of the UK Weather for Monday 13 April 2020

Showers, which were heavy at times, moved southwards overnight across the midlands, Wales and the southeast. The rest of the UK remained largely dry and cloudy throughout with clearer periods for some parts of the west. There was a northeasterly breeze across the UK making it a cooler night than compared to the nights prior. It was a dry and settled day across the UK with many areas starting cloudy, although parts central England and areas of the west had clear skies. The cloud did begin to break up through the morning leaving clear skies and plenty of sunshine, with these conditions continuing and making for a rather pleasant afternoon. Although most places did see plenty of sunshine the cloud in the east was more persistent and lingered throughout the day with only some sunny spells developing in eastern Scotland by the late afternoon. There were strong winds across England but these eased by the evening. The evening continued to be dry with mainly clear skies but still with cloud across eastern England and some building into the far north of Scotland.

### Summary of the UK Weather for Tuesday 14 April 2020

It continued to be cloudy across much of the UK, particularly over Scotland and the east of England, however some longer clearer spells did develop. Mostly dry overnight with some heavy rain over the Shetlands in the early hours. Lightning was observed off the south coast of Wales. It was a dry morning with clear skies and plenty of sunshine for the majority of the UK. However there was rain in the far northeast to start but this soon eased. The far north was rather cloudy also and this spread further south covering Scotland, Northern Ireland and northern England with mainly high cloud so giving some hazy sunshine. Cloud in the southeast to start began to clear with sunny spells developing. Cloud continued to spread further south through the afternoon with the thickest cloud over northern England and some sunny spells breaking through away from the far north of Scotland. The south held on to largely clear skies with a little cloud building in the southeast and the best of the sunshine in the southwest. Dry conditions continued through the evening with clear skies in the south. The cloud in the north cleared slightly to be confined to Scotland and the east coast.

### Summary of the UK Weather for Wednesday 15 April 2020

It stayed mostly dry overnight, with some showers over the Shetlands and Wales. It was rather cloudy but chilly under any clearer spells that developed, most notably across Northern Ireland and the south of the UK. The calm conditions allowed for some patches of fog to form in the early hours in the south of England. Lightning was observed near the Isle of Wight towards dawn. Through the day, it remained dry with much of the UK seeing plenty of sunshine, the best of which was in the south. Winds were light making for a pleasant afternoon and evening. Western Scotland, however, saw a mostly cloudy day, but still some decent bright spells where the cloud thinned. Through the afternoon, a band of cloud pushed into parts of the Midlands and northern England, where it persisted for much of the evening. The cloud gradually spread northwards as the evening progressed.

This day's summary created 23/04/2020 03:00

### Summary of the UK Weather for Thursday 16 April 2020

It was a dry night with clear skies across most parts of the UK but there was some cloud in the north and around the east coast. Through the night, cloud cleared eastern parts but became thicker in the north and spread further south. Some mist and fog patches developed around dawn in Scotland and the far south. Most places saw a dry start to the day with plenty of bright or sunny spells, though mist, fog patches and cloud lingered across Scotland and the far south of England. As the day progressed, the south/southeast saw a band of cloud and patchy rain creep across the region, though this eased towards evening. Elsewhere remained dry with cloud clearing to leave warm sunshine across most parts. Scotland and northeast England, however, continued to stay cloudy, though western parts saw some sunshine at times.

### Summary of the UK Weather for Friday 17 April 2020

A largely dry and cloudy night for most of the UK with thick cloud across the southwest and on eastern coasts and clearer spells elsewhere. There was a few outbreaks of rain in the south through the night and towards dawn a band of heavy and thundery rain arrived into the southwest. A few mist and fog patches developed especially in the south. A band of heavy rain and thundery conditions pushed up from the south reaching the southwest earlier in the morning and the southeast and south Wales during late morning/early afternoon. The rain continued to push northwards through the evening, where it reached areas of the midlands and northern Wales, although the rain and thunder began to ease across these areas. Northern England, Scotland and Northern Ireland remained dry but cloudy through the day. During the first half of the night, the rain continued to push north and further thunderstorms and heavy bursts of rain pushed into southern England.

### Summary of the UK Weather for Sunday 19 April 2020

After rain cleared eastern England and the far west of Wales through the evening, the majority of the UK saw a dry night. The south saw mostly cloudy skies, but further north there were a good deal of clear spells. Towards dawn, cloud spread into northern areas with the odd shower across Northern Ireland. Although largely bright and sunny in the morning, there was widespread cloud across most of Wales and the southwest, with patchy cloud across the rest of the UK. This largely cleared west by midday with the easterly breeze, leaving widespread sunshine and a warm day, although feeling chillier on the east coast. It stayed bright while cloud moved northwards across parts of the south in the evening.

### Summary of the UK Weather for Monday 20 April 2020

Owing to the continued high pressure, skies were clear overnight for all - apart from the South West and south Wales, which saw patchy cloud move in from the English channel, although both regions remained dry. Despite the lack of cloud, temperatures remained generally mild overnight, with an easterly breeze. Through the morning it was dry throughout largely sunny. Patchy cloud in the southwest and Wales cleared by midday. Afterwards, there was plenty of sunshine throughout the UK apart from some patchy cloud reaching Cornwall at times, and cloud moving further into the southwest from the channel again in the evening. Although a generally warm day, particularly in sheltered spots, the easterly wind kept temperatures cooler for most.

### Summary of the UK Weather for Thursday 23 April 2020

The easterly wind was much calmer than recent night, but not as clear. There was patchy cloudy at times but it remained largely dry, except one or two showers in Northern Ireland. It was chilly under clear skies. There were a few fog patches around in the morning, mainly in the north and east, but these soon cleared leaving a dry day across the UK with plenty of sunshine and light winds. Many parts of the country however saw some high cloud which turned the sunshine hazy at times with the cloud becoming thicker in some central areas. The far north and far south saw clear skies with the best of the sunshine here. A warm day, particularly in the south. It remained dry through the evening with mainly high cloud for many parts although still plenty of late sunshine. The cloud cleared across many parts of Wales and the south with clear skies developing here and in the far north.

### Summary of the UK Weather for Friday 24 April 2020

It was another dry and mild night with clear skies for most with some patchy mist and fog developing, particularly across East Anglia during the early hours. Any mist and fog patches soon cleared leaving a dry morning with largely clear skies and sunshine across the UK. Through the afternoon many parts of the country saw the clear skies continue with a little high cloud over Scotland and Northern Ireland but still plenty of sunshine. Cloud built across the south west, parts of the far south and in western Wales with some brighter spells whilst thick cloud moved in from the North Sea to eastern coasts. A rather warm day for much of the UK but cooler in the east as the cloud continued to build. Thick cloud in the east spread further inland and further north through the evening covering the full eastern side of the country. Cloud in the southwest and Wales became more widespread also, with some seeing the odd light shower. The best of the evening sunshine was seen in Central England and in the northwest.

### Summary of the UK Weather for Saturday 25 April 2020

Overnight, most places stayed dry but it was cloudier than recent nights. Although there were some clear spells at times, especially across Wales. A few mist and fog patches developed across central and eastern England through the early hours, as well as some fairly extensive low cloud. It was another mild night for most places, though a minimum temperature of -2.3°C at Altnaharra No 2, Sutherland was observed under clear skies. Through the morning, most of the murk across the eastern side of the UK burned away to leave another predominantly fine and sunny day everywhere. Patchy cloud was always close to the far southwest and some fair weather clouds bubbled up across central parts, but there was no rain to speak of. Despite the pleasant conditions, temperatures were slightly down on recently, only reaching above upper teens in a few locations. Skies became slightly more overcast through the evening over northern England and southern Scotland, though it was still a pleasant spring evening here and elsewhere under light winds.

### Summary of the UK Weather for Sunday 26 April 2020

It was a dry night across the UK but cloudy for many, especially in the west and becoming increasingly cloudy across Scotland and Northern Ireland. The best of the clear weather was seen in central and southeast England but there was still some fog patches seen here as well as in many other areas of the country. Mild for some but chilly in the southeast under clearer skies. It was a cloudier morning than recently across northern and western parts of the UK, although there was still plenty of sunshine on offer, particularly in East Anglia. Conditions were also predominantly dry, though there were a few showers in the far north of Scotland. Through the afternoon, showers formed for central parts, with a few heavy downpours. Nevertheless, most locations in the UK stayed dry, with southern and eastern parts experiencing another fine and sunny afternoon. Temperatures were slightly up on Saturday's values, peaking in the early twenties for many. There was not much change during the evening, with the showers across central parts slowly fading away, though not before giving some heavy downfalls across parts of Lincolnshire.

### Summary of the UK Weather for Monday 27 April 2020

Overnight saw dry and conditions for much of the UK but with rain across parts of Northern England, heavy on eastern coasts, and heavy showers in the far north. It was a mostly cloudy night also, especially in central areas associated with the rain. Parts of the north had long clear periods, as did the far south but cloud gradually built in from the west here. Some mist and fog patches by dawn particularly in the southwest. After the odd patch of mist and haze along the south coast had cleared in the morning, the band of cloud and rain continued to move southwards across England and Wales. The heavy showers spreading over from Western Scotland persisted through the day and edged into the north of England and Northern Ireland by the evening. As the sun set on the day, the majority of the UK had clouded over, with showers developing in the southwest.

### Summary of the UK Weather for Tuesday 28 April 2020

The southern half of the UK experienced a wet night, as a depression moved in from the Atlantic, skirting the southern coastlines. Further north there was some patchy rain in southern Scotland and a few showers in the north, but the vast majority of locations were dry. The cloud in the south prevented temperatures falling to low amounts, but clearer skies further north allowed temperatures to plummet at prone spots in Northern Ireland and Scotland. The band of cloud and rain continued to make its way northeastwardly across England and Wales throughout the day, bringing persistent outbreaks of rain for many into the evening. Although still cloudy over Scotland and Northern Ireland, there were some brighter spells in between heavy showers.

### Summary of the UK Weather for Wednesday 29 April 2020

A fairly overcast but dry night for many, with just a few spots of rain from the remnants of Tuesday's weather front, particularly in southern Scotland. Again, slightly clearer skies in northern Scotland allowed for some cold minimums. Around dawn, another weather front was moving into the southwest of the UK, bringing some blustery winds and heavy rain. This band of rain pushed northeastwards across the entirety of the UK throughout the day. There were heavy bursts at times and a few rumbles of thunder and lightning were observed in the south. Eastern areas had a cloudy but bright start ahead of the rain, while behind the front there was plenty of sunshine. It was blustery along western and southern coasts. Into the evening, a second band of rain pushed up from the southwest and continued to travel northeast into the night.

### Summary of the UK Weather for Thursday 30 April 2020

Staying relatively mild overnight as bands of cloud and rain moved northeast across the UK, becoming quite windy and gusty in the rain showers. A depression centred over the Republic of Ireland moved slowly across into the Irish Sea, therefore bringing steady rainfall over Northern Ireland, Scotland, Wales and the SW of England (with some lightning observed here towards the early hours). Although rain touched all corners of the UK, there were some longer breaks in the cloud across the centre of the UK and over towards the east. A rather unsettled day across the UK with outbreaks of rain across the west of England, eastern Scotland and Northern Ireland during the morning. The rain from southwest England pushed eastwards bringing heavy outbreaks of rain, hail and thunderstorms to southern and central parts of England into late morning and the afternoon. Elsewhere, there were scattered showers and cloudy skies. It was breezy across England and Wales. Into the evening further outbreaks of rain and showers spread across the UK, in particular Wales and the southwest.

### Daily Extremes

<i>Highest Maximum</i>	<b>16.0°C</b> Kinlochewe (Ross & Cromarty, 25mAMSL)
<i>Lowest Maximum</i>	<b>8.0°C</b> Baltasound No 2 (Shetland, 15mAMSL)
<i>Highest Minimum</i>	<b>8.5°C</b> Gosport, Fleetlands (Hampshire, 1mAMSL)
<i>Lowest Minimum</i>	<b>0.9°C</b> Shap (Cumbria, 252mAMSL) also Drummond Castle (Perthshire (in Tayside Region), 113mAMSL)
<i>Lowest Grass Minimum</i>	<b>-2.5°C</b> Edinburgh, Royal Botanic Garden No 2 (Midlothian (in Lothian Region), 28mAMSL)
<i>Most Rainfall</i>	<b>28.2mm</b> Preston, Cove House (Dorset, 44mAMSL)
<i>Most Sunshine</i>	<b>9.2hr</b> Eastbourne (East Sussex, 15mAMSL)
<i>Highest Gust</i>	<b>51Kt 59mph</b> Capel Curig No 3 (Gwynedd, 216mAMSL)
<i>Highest Gust (mountain)</i>	<b>50Kt 58mph</b> Cairngorm Summit (Inverness-shire, 1237mAMSL)
<i>Greatest Snow Depth at 0900 UTC</i>	No non-zero values

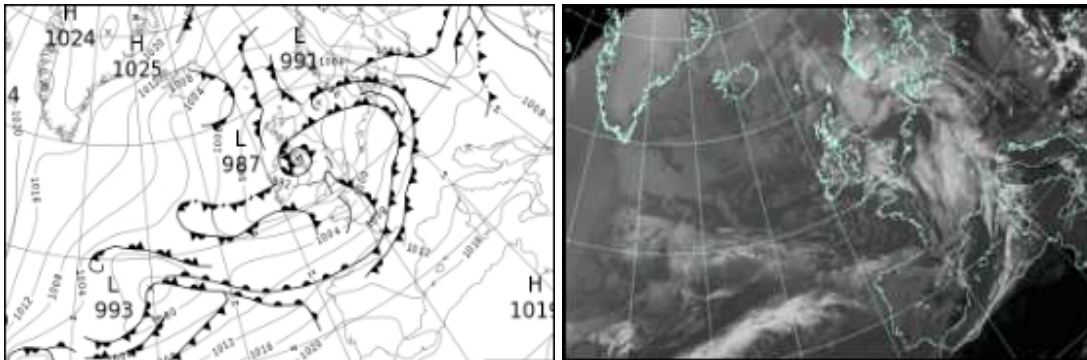

mAMSL refers to station elevation in metres above mean sea level

## Daily Weather Summary for Thursday 30 April 2020

## Daily Weather Summary for Thursday 30 April 2020

None of the selected stations observed a day of sleet or snow falling or non-zero snow depth at 0900 UTC.

## Guidance Notes

UTC = Universal Coordinated Time. For the UK UTC is the same as GMT (Greenwich Mean Time).

National boundaries shown on the European station map are for illustrative purposes only.

### Daily extremes

- Daily extremes have been manually confirmed by Met Office Observations Quality Management as valid observations from the live database at the time of checking. However, more extreme values may still be possible if they occur after the time of production.
- Mountain stations above 500 masl are excluded from lowest temperatures, highest gust speeds and greatest snow depths at 0900 UTC. This is because they are not considered representative of low level areas.
- Counties quoted against each station are based on historical county boundaries pre-1974 and may not reflect current administrative boundaries.

### Analysis charts and satellite imagery

- The satellite imagery is infra-red imagery from the geostationary MSG satellite.
- The rainfall image is derived from satellite data from MSG and rain-radar data. This represents a snapshot of instantaneous rain-rates at 0000 UTC and 1200 UTC and so does not necessarily reflect daily accumulations in the rainfall station map.
- Any analysis charts or satellite images which are unavailable will be displayed as white space.

### Station maps

- The UK maps show station data for the same set of stations presented UK data table. These stations are selected to provide good spatial coverage across the UK; they represent only a fraction of the overall UK observing network.
- Wind speed maps show wind speed in Kt and direction both averaged over the hour up to the time of observation. 1 Kt = 1.151 mph.

### Hourly station data

- The data tables provide spot hourly observations from synoptic messages at 0000 and 1200 UTC. Missing data are denoted by '-'.

- Pressures are mean sea level pressure in hPa.
- For UK stations, Gibraltar and Jersey, the wind speeds and directions are both averaged over the hour up to the time of observation. However, for European stations wind speeds and directions are both averaged over a 10-minute period up to the time of observation.
- Wind speeds are in Kt. Wind directions are stored in the database every 10 degrees and have been converted to the nearest point of the compass. These give the direction the wind is blowing from, not to.
- Cloud amounts are in Oktas from 0 (clear) to 8 (overcast). 9 indicates sky obscured (eg by fog).
- Air temperature and dew point temperature are in Celsius.

### **Temperature maps**

- Daily maximum, minimum and grass minimum temperatures are in Celsius.
- The period for the daily maximum temperature on day D is defined from 0900 UTC day D to 0900 UTC day D+1.
- The period for the daily minimum and grass minimum temperatures on day D is defined as 0900 UTC day D-1 to 0900 UTC day D.
- On any given day D the minimum will typically occur in the early hours of the morning and the maximum in early afternoon.

### **Rainfall, sunshine and max gust speed maps**

- Daily rainfall is in mm from 0900 UTC day D to 0900 UTC day D+1.
- Daily sunshine is in hours from Kipp and Zonen CSD1 automatic sunshine records. Bright sunshine is defined as exceeding 120 W/m<sup>2</sup>.
- Max gust speeds are the daily max gust in Kt from 0000-0000 UTC

### **Snow maps**

- The day of snow falling map displays data from present weather sensors, showing stations which have recorded sleet or snow falling at any point in the day (0000-0000 UTC).
- The snow lying map shows level snow depth as recorded by the automatic snow depth sensors at 0900 UTC. These snow depth sensors do not record snow depth if this is less than 1cm.
- Snow depth sensors are normally operational from October to April, in the event of snow falling outside this period data availability may be limited.
- Snow maps will only be displayed if one or more of the selected stations on that date have recorded either snow falling or non-zero snow depths. If snow maps are not

displayed it is still possible that other stations in the network have recorded a day of sleet or snow falling or non-zero snow depth.
