Daily Weather Summaries for December 2021

If you have any questions or feedback about this product or wish to obtain further data please contact the Met Office.

This document contains daily weather summaries for each day of December 2021. The Met Office National Meteorological Library and Archive holds a continuous record of daily weather summaries or daily weather reports from 1860, and these daily weather summaries form a continuation of that series.

The purpose of each summary is to provide an overview of the weather conditions across the UK on that day, with the historical emphasis mainly based on observations from surface network of weather stations, although the format has varied over the decades. While the emphasis remains on observations from the surface network, the current daily weather summaries supplement these by including satellite and rain-radar imagery to provide a more complete overview. The current format of the daily weather summaries is as follows:

1. Text summary of the main characteristics of the weather during the day, written by an operational meteorologist in the Met Office operations centre.
2. Table of daily extremes for the UK for key climate variables including temperature, rainfall, sunshine and gust speeds.
3. Overview of the synoptic situation at 00 and 12 UTC comprising: analysis charts showing the surface pressure pattern and associated weather fronts; North Atlantic and European infra-red satellite images showing cloud-cover; combined infra-red and rain-radar images of the UK; maps of wind speed and direction at 00 and 12 UTC; observations of pressure, wind speed and direction, cloud cover, air and dewpoint temperature at selected UK and European stations in data tables.
4. UK maps of key climate variables from observing stations including maximum, minimum and grass minimum temperature, rainfall, sunshine, gust speed and snow.
5. Further guidance notes

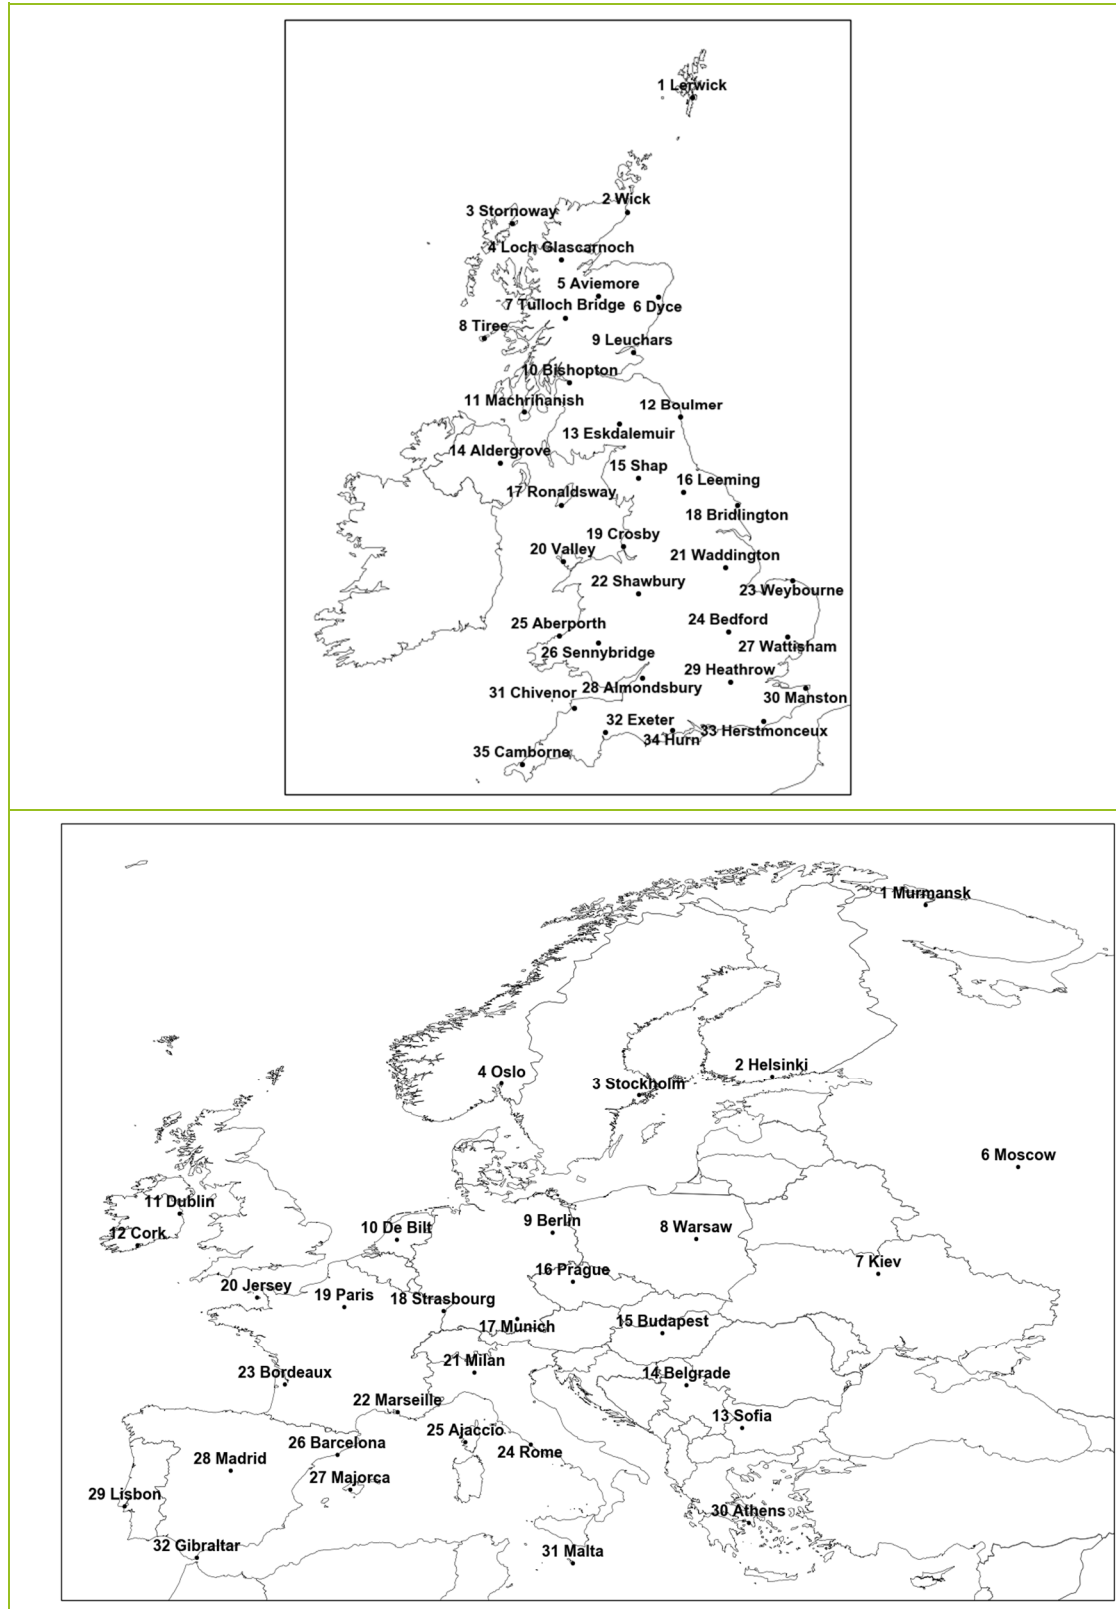

If you spot any data errors or omissions in this product please contact the Met Office.

Daily Weather Summary for Wednesday 01 December 2021

This day's summary created 08/12/2021 03:03

Summary of the UK Weather for Wednesday 01 December 2021

Low pressure dominated as heavy precipitation continued into the night, covering the north of the UK and Scotland. This eased towards the early hours as the fronts moved southeastwards, persisting over northern England and Wales. The Midlands and southern regions of England experienced this rain in patchy form as fronts eased into dawn. The southwest region experienced mostly dry but slightly patchy rain throughout this period. Winds throughout this time were strongest following the occluded front of the low-pressure system, as well as being gusty at coasts. Low pressure system continued to dominate the weather through the day, bring showery and cloudy conditions to much of the UK. The heaviest band of rain pushed southward through the day, tracking from eastern Scotland through northern and central England pushing into the southern England by late evening. Behind this front brought there was a drop in temperatures along with some drier and brighter interludes, with showers developing along eastern coasts. It remain blustery for most, increasing the wild chill through the day.

Summary of the UK Weather for Thursday 02 December 2021

Gusty northwesterly winds brought showers to eastern coasts overnight while parts of Northern Ireland, northeast Scotland, Wales and parts of the southwest experienced some showers throughout the early morning; these cleared by dawn. Elsewhere remained dry with patchy cloud throughout the night. It was a cold night with a widespread and in places sharp frost where skies remained clear. Through the day eastern coasts remained breezy, with rain turning to snow at times, while the southwest experienced occasional showers. Most inland areas were cold and dry through the morning. During the afternoon, a low pressure system pushed a warm front in from the northwest, bringing further rain and cloud to Scotland and Northern Ireland. Southern areas remain dry and clear with some sunny spells. Showers along eastern coasts and through southwest eased towards the end of the day. Through early evening, the rain in northwest pushed southeastwards, turning to snow on its leading edge. The southeast remained dry for most of the evening, with an early frost reforming, before turning cloudier later.

This day's summary created 10/12/2021 03:03

Summary of the UK Weather for Friday 03 December 2021

A low pressure system dominated the weather through the early hours of the day, bringing persistent rain to Wales as well as the midlands, southern and southwestern areas of the UK, pushing southeastward. There was also some snow on the leading edge of the rain band. Further north Scotland and the north of England experienced showery conditions. Some clearer conditions followed the frontal system, before a second thick band of cloud pushed in from the west. Winds remained northwesterly to the north and southwesterly to the south and predominantly blustery through the night particularly in coastal locations. It was a rather cloudy and wet day for most. There were some scattered showers in the far north of Scotland in the morning, before becoming heavier and more organised by midday. Persistent rain continued to affect much of Wales throughout the day, as well as the west midlands and southwest England by the afternoon. As midnight approached, much of the rain cleared in the south of the country, but plenty of locally heavy showers persisted in the north.

Summary of the UK Weather for Saturday 04 December 2021

A low pressure system brought persistent rain and some hill snow to parts of Scotland, Northern Ireland and northern England, and also a band of rain swept across the UK from northwest to southeast. The southeast of England remained dry but with extensive low cloud, mist and fog through most of the night before rain and stronger winds arrived just before dawn. Behind the fronts there was an interlude of some drier and clearer conditions, before showery conditions became predominant once more. London and southeast England became dry during the morning with some sunshine until mid-afternoon, whereas Northern Ireland, Wales and southwest England experienced cloud and intermittent showers. Northern England and Scotland remained under a large band of rain with hill snow associated with an occluded front, for most of the day. Southeastern Scotland experienced snowfall to lower levels from mid-afternoon and a yellow weather warning was issued. During the evening rain extended south to affect central and eastern England, with rain and hill snow continuing across N England and SE Scotland. It was clearer elsewhere with blustery showers.

Summary of the UK Weather for Sunday 05 December 2021

The low pressure system at the southeast of the UK continued to dominate the weather through the day. In the morning, the occlusion remained over the eastern and central UK, bringing persistent rain and clouds to many parts in the eastern half of the UK. Apart from this band of rain, Northern Ireland, Wales and the far southwest saw some frequent showery rain throughout the morning. Into the day, the occlusion brought further showers to southeastern Scotland and central England, while the rest of the UK saw drier and brighter conditions as the rain gradually eased. In the late afternoon, another set of weather fronts pushed more clouds and rain into the UK from the Atlantic, bringing another spell of rain to Northern Ireland in the evening, while the showers in southeastern Scotland and central England finally faded off to give a dry evening to these regions.

Summary of the UK Weather for Monday 06 December 2021

A set of weather fronts from the Atlantic continued to push into the UK from the west, the associated clouds and rain affected Northern Ireland, western Scotland at first, then northwest England, Wales and southwest England saw this band of rain pushed through. Northern Ireland and Scotland were windy in the early hours, while the southeast experienced a dry and calm night. Fog was formed in the southeastern UK as the lack of wind. A low pressure system situated to the north of the UK has dominated the weather, bringing unsettled conditions to much of the country. The band of rain from overnight continued to make its way east across the country before reaching mainland Europe by early evening. The western isles and highlands of Scotland have seen persistent heavy rain throughout the day. Snow was reported across Lincolnshire and Derbyshire. As midnight approached, skies largely cleared but the odd shower remained, which allowed temperatures to drop more than recent nights.

This day's summary created 14/12/2021 03:06

Summary of the UK Weather for Tuesday 07 December 2021

Storm Barra moved over Northern Ireland in the early hours, with an extended band of heavy rain covering Wales and central England, and showers over the southwest. Elsewhere had rather extensive cloud cover by dawn. Snow fell over higher ground in northern areas of the UK, as temperatures remained low throughout, with the exception of the far southwest that remained double figures. Strong winds were experienced on western coasts, with large waves and coastal gales beginning as Storm Barra moved over the UK. Storm Barra dominated the weather in the UK throughout the day, forcing a band of heavy rain to move westwards across the country, as well some strong winds with several yellow warnings being issued. The maximum gust recorded was 86 mph. As the main rain band moved east across the country, it was followed by more isolated, scattered showers, as well as some sunny spells for more western areas. By midnight, the organised rain cleared the mainland UK, but continued to affect the Western Isles, Orkney and Shetland.

Summary of the UK Weather for Wednesday 08 December 2021

The low pressure centre of Storm Barra moved slowly across the centre of the UK in the early hours, bringing heavy rain to Northern Ireland, Wales, western Scotland and western England. The southwest and northern Scotland also experienced showers. The strong winds brought on by Barra continued, with maximum gusts reported of 82 mph in Aberdaron, Gwynedd. Most of the UK was under thick cloud cover, with the exception of southern England which cleared by dawn. Through the morning the low pressure system continued to travel northeastwards, bringing heavy rain to areas of northwest and central England, in addition to much of Wales and Northern Ireland. Through the afternoon, winds began to ease as bands of rain continued to swirl around the low pressure centre, now situated to the northeast of England. During the evening, it was dry for eastern and southern Scotland and northeastern and southern England, with clear spells leading to a little bit of frost. Showers cleared across Northern Ireland, however continued over Wales, central England and the far northeast.

This day's summary created 16/12/2021 03:03

Summary of the UK Weather for Thursday 09 December 2021

The weather continued to be dominated by the remnants of storm Barra, which slowly made its way northeast through the night. It was a cloudy start for most, with a band of rain stretching from the Cheshire gap to The Wash, which cleared by dawn, as well as some showers over the western isles and western Wales. It was windy throughout the country, especially along coastal areas, but this slowly eased as the morning progressed. The unsettled conditions continued through the morning, as an occluded front cleared northeastwards, having brought an arm of cloud across the length of the UK. Behind this front, another occluded front with a warm and cold front attached, began making its way to Northern Ireland and continued to scale the span of Great Britain. This brought a band of heavy rain across all western areas, along with a blanket of cloud. As this cleared eastwards, clear spells and blustery showers followed from the northwest, with hail locally and some snow on high ground, particularly to the north.

Summary of the UK Weather for Friday 10 December 2021

Various occluded fronts slowly made their way across the UK overnight, leading to some wet, windy and cold conditions for many. A band of heavy rain lingered over East Anglia and the southeast throughout the morning, clearing all but the far east of East Anglia by dawn. It was followed by some frequent blustery showers, which also affected much of Wales, Scotland, Northern Ireland and the southwest of England for most of the morning. An ice warning was issued for parts of Scotland, northwest England and Northern Ireland. Rain was very slow to clear from the far east of East Anglia during the day, finally moving into the North Sea by 3pm. Elsewhere, many inland areas saw a good deal of sunshine, however frequent showers affected northern and western coasts exposed to the northwesterly wind, with the Cheshire Gap shower streamer taking showers further inland into the Midlands. It was a cool and breezy day for all. Into the evening winds fell light, and under clear skies temperatures fell rapidly, allowing a frost to form, particularly in the east.

Summary of the UK Weather for Saturday 11 December 2021

It was a rather dry and cloudy start to the day for most. With cloud providing insulation at the surface across western locations, it was a mild night. However, further east, it was a cold and frosty night, especially early on. During the small hours, some rain crept into northwestern areas, in particular Scotland and Northern Ireland. Through the day, a warm front crossed the country, with significantly milder air behind it. Temperatures had risen to 12-13 degrees Celsius by the end of the day in southwest England and Northern Ireland. It was a cool and cloudy day further east, but temperatures continued to rise through the evening here. Outbreaks of rain spread eastwards on the warm front. It was mainly light rain, but there were some areas of heavier rain, particularly in western Scotland, northwest England, and later Lincolnshire.

This day's summary created 20/12/2021 17:32

Summary of the UK Weather for Sunday 12 December 2021

The day started rather cloudy for most, with low pressure situated to the northeast of the UK. A cold front was present across the north of England, bringing a band of thick cloud to northern England and Northern Ireland. It remained dry for most though the small hours, however, some showers swept eastwards across central England and parts of Wales. More prolonged rain continued through the morning in northwest England and western Scotland, while south and southwest England and Wales saw widespread showers through the day. Showers or longer spells of rain continued through Scotland, while towards the evening and into the night the Western Isles saw prolonged heavy rain as an area of low pressure moved north. There was widespread cloud cover, however there were also breaks in the cloud, particularly in the east. The area of low pressure developed rapidly through the day, bringing strong winds to the Western Isles and west coast of Scotland. A band of rain moved into Wales through the evening. It was very mild.

Summary of the UK Weather for Monday 13 December 2021

Through the early hours of the morning an explosively deepening area of low pressure passed just to the northwest of Scotland, heading towards the Northern Isles. Wind gusts of 78 mph were recorded in Western Scotland and the Shetland Isles, with a gust of 116 mph out to sea! There was some rain over western Scotland from this, followed by showers. Further south, it was cloudy and mild with some drizzle in Wales, the West Midlands, and SW England, with an area of heavier rain moving up the Irish Sea. Through the day the deep area of low pressure moved away, but it remained windy and showery in the north. In England and Wales, a front remained in place most of the day moving very slowly south, with prolonged rain affecting the north of Wales, northwest England, and the Midlands. To the south of the front, it was very mild and cloudy, while north of it was colder. The rain on this front eased later in the evening, leaving a legacy of low cloud and fog.

Summary of the UK Weather for Tuesday 14 December 2021

It was a cloudy start to Tuesday for many with a few breaks moving south from southern Scotland, through Northern England and into the north Midlands. There was some drizzle through the early hours from a decaying weather front that had stalled through Wales and central England, and this was associated with low cloud, and some fog to the north of it. Heavier rain affected western Scotland as a new warm front moved in, with freshening winds. It was a mild night in southern England, but cooler elsewhere. The day remained dry for most except for western and northern Scotland which experienced rain as a cold front gradually passed. This rain was heaviest in the west. Parts of west Wales also received some rainfall, however this remained light. Stratus lingered over most of the country, with some breaks in the south of England. Winds remained light, however were strongest in northern Scotland along coasts.

Summary of the UK Weather for Wednesday 15 December 2021

Rain continued through the evening and overnight in northern and western Scotland and then the Central Belt, heavy at times, from a stalled weather front. This moved very slowly southwards, affecting the Borders by later in the morning. Light rain affected Wales, northwest England and Kent in the early morning. Low cloud and fog affected most of the country through the night, but there were some clear spells across Wales and central England, and there was more high level cloud across Scotland. It was windy on the Scottish coast, but calmer elsewhere, and quite mild. Morning rain over western Scotland soon reduced into the afternoon, leaving just some parts of Northern Ireland and northwest England with rain. Winds remained light with thick stratus covering most of the UK today with some breaks across the Midlands and parts of East Anglia. High pressure continued to dominate. Rain and drizzle affected the western Borders and Northern Ireland through the evening. It remained quite windy in the north and west of Scotland.

Summary of the UK Weather for Thursday 16 December 2021

With high pressure still dominating, most of the country saw settled but cloudy weather, however a slow moving weather front across central Scotland brought high level cloud and rain, affecting the west on particular. The best of any cloud breaks were on northern England. Winds were slack for most places, but started picking up into the early morning along the western Scottish coast and in the Western Isles. North and east Scotland saw some light rain through the morning whilst the rest of the nation stayed dry with variable cloud cover. With high pressure continuing to dominate the synoptic situation, conditions remained benign into the afternoon and through the evening. Fog patches developed into the night, particularly under clearer skies in the east and Scotland. Winds remained calm throughout.

Summary of the UK Weather for Friday 17 December 2021

High pressure dominated the UK again and covered most areas with thick cloud, though clear spells were experienced in eastern Scotland and parts of eastern England. Conditions remained settled throughout the night, however a slow-moving set of fronts migrated east across Scotland and some northern parts. Low cloud and fog crept in overnight to highland regions and most of the east, lingering through the night. It was windiest along the south coast in the west. Despite widespread cloud cover across the UK it remained dry throughout the rest of the morning and throughout the afternoon where some clearer spells occurred. Fog once again reformed into the early evening, with the most impactful effects seen across the east of the country. Winds remained calm throughout the day and night.

Daily Weather Summary for Saturday 18 December 2021

This day's summary created 25/12/2021 03:03

Summary of the UK Weather for Saturday 18 December 2021

High pressure once again dominated overnight, leaving a dry night for most. Nevertheless, a vast amount of cloud covered the UK. Some areas with high ground experienced fog and mist forming which persisted into the early morning and some into the day, enough to warrant a warning in the east. A warm front edged northeast towards Scandinavia from the North Sea, however no weather fronts were present over the UK overnight. Winds remained light throughout the night. As a result of the high pressure centred over Lincolnshire it remained dry throughout for the whole country. Low cloud affected much of England and Wales throughout the day. There were also some fog patches but this was mainly confined to the east and northeast. Sunny spells were mainly recorded across Scotland, northern England and west Wales however, isolated fog patches did persist across the central belt throughout the day. As a result of an inversion, the tops of high ground were locally very mild.

Summary of the UK Weather for Sunday 19 December 2021

High pressure continued to dominate the weather into the start of Sunday bringing widespread settled, but cloudy, conditions. Some frontal activity was present over the UK although remained uneventful. Widespread fog and mist developed through the night and into the early hours of the morning, in some cases freezing fog formed. Winds remained light throughout the night. It was a cloudy day for most of the country with lots of low cloud around. Mist and fog remained throughout much of the day and affected central and eastern areas. The fog and mist were slow to clear from the south and Northern Ireland. The best of any bright spells were in the lee of high ground, which included west Wales, west Scotland and northwest England. A decaying cold front moved slowly south-westwards through the day reaching northeast Scotland by evening. Clearer weather followed this front. Winds remained light throughout however, windiest in the far southwest.

Summary of the UK Weather for Monday 20 December 2021

A benign start to the day as high pressure continued to dominate. The nation remained cloudy throughout the night and into the early hours of the morning whilst staying dry. Some areas saw mist and fog particularly over high ground. A weakening cold front did pass over the UK although had little impact on the weather. Winds remained light or calm. The early morning settled conditions continued throughout the rest of the day, as the weakening cold front continued to slowly travel westwards across Great Britain. It also remained dry and cloudy throughout the day for all. Heading into the evening, a few breaks in the cloud across England and Wales resulted in some chillier areas.

Summary of the UK Weather for Tuesday 21 December 2021

A rather cloudy start on Tuesday for all, with high pressure situated to the southeast of the UK. The cloud was thick enough to produce patchy light rain and drizzle along the East Midlands coast as well as northwest and northeast Scotland. A low pressure system with a decaying warm front and a cold front was positioned to the north of the UK and moved southwards during the early hours towards the UK. Winds remained light across most of the country with the strongest winds along the coasts of the southwest. The high pressure system continued to dominate the synoptic situation, leading to a benign day across the UK - remaining dry and cloudy for most. Heading into the evening, clear spells developed from the south, leading to a colder night than recent, with widespread frost. In addition, it became rather windy across western and south western areas.

Summary of the UK Weather for Wednesday 22 December 2021

The low pressure system to the north of the UK brought light rain and drizzle to northwest Scotland. Another system was approaching the UK from the west during the early hours bringing rain to the southwest and Wales. It remained calm for most of the country but became windy across southwest England and southwest Wales. It remained largely cloudy with some clear spells mainly across northern Scotland. Frost was widespread with isolated fog and freezing fog patches. Through the morning, the frontal systems slowly travelled northeastwards, bringing rain further inland across western areas, particularly Wales and southwest Scotland. During the afternoon, most northern and western areas experienced some rainfall, with southeastern locations remaining dry. It remained cloudy for most heading into the evening, and the rain continued to clear eastwards. Some snow and freezing rain fell over high ground across Scotland, as even more rain headed towards Northern Ireland.

Summary of the UK Weather for Thursday 23 December 2021

A number of weather fronts affected the UK through the early morning, bringing showers or longer spells of rain, predominantly for eastern Scotland, as well as central and eastern England. For some areas of high ground in Scotland, this was wintry, with snow and freezing rain. Another front moved in from the west, bringing rain to the southwest, Wales and Northern Ireland. It was cloudy for most of the country, with fog for many areas in the west and north. Temperatures became milder for many areas. Frontal patterns continued to bring unsettled conditions across the UK for the rest of the morning and into the afternoon with widespread showers and cloud cover. A band of heavier more persistent rain crossed the north England and Scotland through the morning before lingering over Scotland throughout the afternoon, evening, and night. The south remained mostly dry with just some isolated showers.

Summary of the UK Weather for Friday 24 December 2021

An occlusion brought persistent rain and hill snow to parts of eastern Scotland through the day, gradually easing through the early hours of the morning. Elsewhere most places experienced dry conditions with areas of mist, fog and low cloud. This continued through the morning with some light rain and drizzle in northern England. A secondary occlusion moved in from the southwest bringing a band of thick cloud and persistent rain to southwest of England, then Wales and Northern Ireland. It was a mild night, but chilly where skies cleared. An occluded front has slowly made its way across the country from the southwest through the day, bringing with it a band of light rain. A cold front also pushed in from the north over Scotland, bringing small amounts of rain, but was followed by some clear spells in the afternoon. As midnight approached, a band of rain stretched from Manchester to London, with largely dry but cloudy conditions affecting the rest of the country, apart from the north of Scotland and the southwest of England, which saw some clear skies.

This day's summary created 01/01/2022 03:04

Summary of the UK Weather for Saturday 25 December 2021

It was a rather wet start to Christmas day for many across the UK due to an occluded front stretching from Northern Ireland to the southeast of England. This continued to push eastward through the night bringing persistent and locally heavy rain to many areas. Elsewhere Scotland experienced drier and clearer conditions though some wintry showers affected eastern areas at times through the night. Rain eased through the night before another area of heavy showery rain approached the southwest coast pushing northeastward into Wales by dawn. Several fronts remained fairly stationary over the UK through the day and brought a band of persistent rain which affected areas of the southwest, Wales and Northern Ireland, as well as some snow in Aberdeenshire. Most of the country remained cloudy throughout the day, but there were some clear spells on the east coast of England and western Scotland. As midnight approached, the rain band slowly made its way north eastwards and stretched from Northern Ireland to the southeast of England.

Summary of the UK Weather for Sunday 26 December 2021

It was a mild night for most, however any northern rain fell as snow on peaks above 500m with sleet and heavy rain elsewhere. A series of occluded fronts brought wet, mild air from over the Atlantic northeastward over the UK with Wales and Northern Ireland getting hit first. The occlusions migrated over the UK overnight, accompanied by heavy rain throughout, causing localised flooding to some. The rain cleared in western parts towards early morning, however visibility remained poor with fog on hills, throughout the Highlands, Pennines and Cumbria. Into the morning, the rain cleared northeastwards, giving a drier but cloudy morning to the far north and western UK with some showers, especially Wales and Northern Ireland. The afternoon saw showers slightly breaking up, with eastern parts experiencing some drier spells with low cloud, and some sunshine in the southwest. Some inland areas saw fog patches into the evening, with clearer skies into the parts in the southwest. Further clouds arrived from the Atlantic towards the end of the day.

Daily Weather Summary for Monday 27 December 2021

This day's summary created 03/01/2022 03:03

Summary of the UK Weather for Monday 27 December 2021

It was a wet start to the evening for eastern Scotland as the tail end of some occluded fronts moved northeastwards. It remained dry for most until the early hours when several occluded fronts moved north/northeastwards, starting over southwest Cornwall, and moving over the south and Wales as the night continued. This brought heavy rain initially, though turned patchy towards morning. Other northern and central parts also experienced some lighter patchy rain. Hill fog and low cloud was experienced overnight and some snow on the highest peaks in Scotland. Monday daytime continued grey and wet for many areas of England and Wales. It was a thoroughly wet day for southwest England, with frequent showers moving through after the overnight persistent rain. This rain eased as it moved northwards, bringing another damp and murky day for the Midlands. Some stations in the Midlands had seen over ten days without any measurable sunshine by this point. There were some showers affecting Scotland and Northern Ireland, falling as snow over the Scottish mountains. Northern and western Scotland saw the best of the sunshine.

Summary of the UK Weather for Tuesday 28 December 2021

A low pressure system sat to the west of the UK through the night, with an associated occluded front that slowly pushed its way northwest. This caused a bit of a north south split in weather conditions, with it being cloudy in north and much clearer in the south. Most of the country was dry, apart from in Wales where there was some heavy rain which spread into northwest England by dawn. Through the morning the frontal system continued to push eastward across the UK bringing some heavy and persistent rain to Wales, the Midlands and parts of north eastern England, before pushing into the south east. Behind the front saw drier conditions with some bright spells for most of the country. By dusk a secondary band of heavy rain and thick cloud made landfall in the southwest and pushed northeastward through the night.

Summary of the UK Weather for Wednesday 29 December 2021

The weather overnight was mainly affected by a low pressure system to the west of Ireland. A band of rain, as well as breezy wind, arrived from the southwest and mainly affected southwest England and Wales. This band stretched from Northern Ireland to Kent by dawn. Ahead of the rain band it was largely cloudy with light winds, but there was the odd clear spell in Scotland. Weather fronts continued to push eastward through the day, once this had cleared many parts of the country experienced dry conditions with some bright spells; while Scotland experienced persistent and locally heavy rain right through the day. It was a very windy day for most with the strongest winds and coastal gales experienced in Northern Ireland. Temperatures remained above average leaving a very mild day across the UK.

This day's summary created 06/01/2022 03:03

Summary of the UK Weather for Thursday 30 December 2021

Unsettled conditions continued, with a band of persistent and, in places, heavy rain sweeping across the UK, from Wales to the midlands and the northwest. This continued throughout the early hours with the most persistent rain sitting over northern England and western Scotland. Wales and the southwest also saw further, lighter, rain. The southeast remained mostly dry. Into the morning, some drier, brighter interludes were seen throughout the UK, excluding south Wales, where rain persisted. During the afternoon, another band of rain moved northeastwards from the Atlantic, bringing some more persistent, locally heavy rain to northern Wales and northwestern England, before continuing to push northeastwards over Northern Ireland, southern Scotland and northeastern England, while southern UK experienced a drier afternoon, with some light rain spells. Eastern England remained mostly dry throughout. Into the evening, the band of rain stalled over parts of Northern Ireland, Scotland and northern England. Elsewhere it was mostly cloudy with rain or drizzle for many, except far northern Scotland, which remained dry. Another exceptionally mild December day.

Summary of the UK Weather for Friday 31 December 2021

A large band of rain moved northeast across the UK through the early hours, bringing persistent rain to northern England, Northern Ireland and southern Scotland, as well as heavy showers to most of Wales and the southwest of England. Elsewhere remained dry, with significant cloud over Scotland. Frontal bands continued to pass across the UK during the day, bringing some heavy rain across Scotland and southeast England. This rain quickly dissipated, before a further area of showers approached from the west into Northern Ireland, then into areas of the Lake District. Elsewhere remained fairly cloudy throughout, with some clear skies forming across central and southern areas into the evening. A daily maximum temperature record for New Year's Eve was made, a fitting end to a mild December 2021.

Daily Weather Summary for Friday 31 December 2021

Daily Weather Summary for Friday 31 December 2021

None of the selected stations observed a day of sleet or snow falling or non-zero snow depth at 0900 UTC.

Guidance Notes

UTC = Universal Coordinated Time. For the UK UTC is the same as GMT (Greenwich Mean Time).

National boundaries shown on the European station map are for illustrative purposes only.

Daily extremes

- Daily extremes have been manually confirmed by Met Office Observations Quality Management as valid observations from the live database at the time of checking. However, more extreme values may still be possible if they occur after the time of production.
- Mountain stations above 500 masl are excluded from lowest temperatures, highest gust speeds and greatest snow depths at 0900 UTC. This is because they are not considered representative of low level areas.
- Counties quoted against each station are based on historical county boundaries pre-1974 and may not reflect current administrative boundaries.

Analysis charts and satellite imagery

- The satellite imagery is infra-red imagery from the geostationary MSG satellite.
- The rainfall image is derived from satellite data from MSG and rain-radar data. This represents a snapshot of instantaneous rain-rates at 0000 UTC and 1200 UTC and so does not necessarily reflect daily accumulations in the rainfall station map.
- Any analysis charts or satellite images which are unavailable will be displayed as white space.

Station maps

- The UK maps show station data for the same set of stations presented UK data table. These stations are selected to provide good spatial coverage across the UK; they represent only a fraction of the overall UK observing network.
- Wind speed maps show wind speed in Kt and direction both averaged over the hour up to the time of observation. 1 Kt = 1.151 mph.

Hourly station data

- The data tables provide spot hourly observations from synoptic messages at 0000 and 1200 UTC. Missing data are denoted by '-'.

- Pressures are mean sea level pressure in hPa.
- For UK stations, Gibraltar and Jersey, the wind speeds and directions are both averaged over the hour up to the time of observation. However, for European stations wind speeds and directions are both averaged over a 10-minute period up to the time of observation.
- Wind speeds are in Kt. Wind directions are stored in the database every 10 degrees and have been converted to the nearest point of the compass. These give the direction the wind is blowing from, not to.
- Cloud amounts are in Oktas from 0 (clear) to 8 (overcast). 9 indicates sky obscured (eg by fog).
- Air temperature and dew point temperature are in Celsius.

Temperature maps

- Daily maximum, minimum and grass minimum temperatures are in Celsius.
- The period for the daily maximum temperature on day D is defined from 0900 UTC day D to 0900 UTC day D+1.
- The period for the daily minimum and grass minimum temperatures on day D is defined as 0900 UTC day D-1 to 0900 UTC day D.
- On any given day D the minimum will typically occur in the early hours of the morning and the maximum in early afternoon.

Rainfall, sunshine and max gust speed maps

- Daily rainfall is in mm from 0900 UTC day D to 0900 UTC day D+1.
- Daily sunshine is in hours from Kipp and Zonen CSD1 automatic sunshine records. Bright sunshine is defined as exceeding 120 W/m².
- Max gust speeds are the daily max gust in Kt from 0000-0000 UTC

Snow maps

- The day of snow falling map displays data from present weather sensors, showing stations which have recorded sleet or snow falling at any point in the day (0000-0000 UTC).
- The snow lying map shows level snow depth as recorded by the automatic snow depth sensors at 0900 UTC. These snow depth sensors do not record snow depth if this is less than 1cm.
- Snow depth sensors are normally operational from October to April, in the event of snow falling outside this period data availability may be limited.
- Snow maps will only be displayed if one or more of the selected stations on that date have recorded either snow falling or non-zero snow depths. If snow maps are not

displayed it is still possible that other stations in the network have recorded a day of sleet or snow falling or non-zero snow depth.
