THE BEAUFORT SCALE OF WIND FORCE.

Beaufort Number.	Admiral Beaufort's General Description of Wind.	Specification for use on Land, based on observations made at Land Stations.	Limits of Mean Velocities Statute Miles per Hour.
0	Calm	Calm; smoke rises vertically	Less than 1
1	Light air	Direction of wind shown by smoke drift	1-3
2	Slight breeze	Wind felt on face; leaves rustle	4-7
3	Gentle breeze	Leaves and small twigs in constant motion; wind extends light flag	8-12
4	Moderate wind	Raises dust and loose paper; small branches are moved	13-18
5	Fresh wind	Small trees in leaf begin to sway; crested wavelets on inland waters	19-24
6	Strong wind	Large branches in motion; whistling heard in telegraph wires	25-31
7	High wind	Whole trees in motion; inconvenience felt when walking against wind	32-38
8	Gale	Breaks twigs off trees; generally impedes progress	39-46
9	Strong gale	Slight structural damage occurs (chimney pots and slates removed)	47-54
10	Whole gale	Seldom experienced inland; trees uprooted	55-63
11		Very rarely experienced; accompanied by widespread damage	64-75
12	Hurricane		Above 75

BEAUFORT NOTATION OF WEATHER.

blue sky (not more than a quarter covered).
 partly cloudy (one half covered).
 generally cloudy (three-quarters covered).
 drizzle. h. hall. KQ line squall.
 lightning. o overcast sky.
 mist, visibility 1000-10000 m.
 fog, thick fog, less than 200 m.
 precipitation within sight of station.
 passing showers. r rain.
 snow. ra sleet. t thunder.
 unusual visibility. y dry air.
 dust haze; the turbid atmosphere of dry weather.

With present weather is combined, whenever possible, the general character of the weather.
 A "solidus" divides actual existing weather from preceding conditions, thus: -b/r=fair weather after rain; i=intermittent; -="decreasing"; += "increasing"; h(r)="hail" or "rain and hail".
 Capital letters indicate intense, suffix o indicates slight and repetition of letters continuity, thus: -
 R = heavy rain.
 rr = continuous moderate rain.
 rrr = continuous light rain.

GALE WARNINGS.

The Meteorological Office issues warnings to ports and fishing stations of gales on or near the coasts of the British Isles. When one of these notices has been received at a station a black canvas cone is hoisted.

The South Cone (point downwards) is hoisted for gales from S.E., veering to S.W., W. or N.W.
 " S.W., veering to W. or N.W.
 " W., veering to N.W.
 " E., veering to S. or S.W.

The North Cone (point upwards) is hoisted for gales from S.E., E. or N.E., backing to N.
 " N.W., veering to N., N.E. or E.
 " N., veering to N.E. or E.
 " N.E., veering to E.

The Signals remain hoisted after the receipt of a warning telegram until danger of a gale is passed.
 The Districts to which warnings are sent are shown in the British Section of the Daily Weather Report by the following symbols:—

▼ South Cone hoisted
 ▲ North " "

NOTES ON THE INFORMATION CONTAINED IN THE BRITISH AND INTERNATIONAL SECTIONS OF THE DAILY WEATHER REPORT.

Heights of Stations.—The heights of British Stations above M.S.L. published in the British Section of the Daily Weather Report refer to the plot of ground on which the rain gauge is situated.

Pressure.—The distribution of barometric pressure at Mean Sea Level is shown by means of isobars which are drawn for intervals of 2 millibars on the British Section of the Report and for intervals of 4 millibars on the International Section.

The wind at a height of 1,500–2,000 feet above ground usually blows along the isobars and, for the same temperature, pressure and latitude, the speed of the wind is inversely proportional to the distance between the isobars, e.g., for isobars 1 inch apart (160 miles) in the Daily Weather Report the speed of the upper wind is about 12 m.p.h. in latitude 55°, with a temperature of 50° F. and a pressure of 1,015 mb; if, however, the isobars are $\frac{1}{2}$ inch apart the corresponding speed is 24 m.p.h.

The scale below can be used with both the International and the British Sections. If the distance between consecutive isobars is measured along the rule from the left-hand extremity the geostrophic wind is shown by the scale in miles per hour.

GEOSTROPHIC WIND SCALE FOR

4 mb isobars on 1 : 2 × 10⁷ Charts.
or 2 mb " " 1 : 10⁷ "
or 1 mb " " 1 : 5 × 10⁶ "

This scale applies under the following conditions:—

Pressure, 1,015 mb. Temperature, 283° A=50° F. Latitude, 55°.

Corrections.—For an increase of 10 mb pressure, subtract 1% from velocity; for an increase of 10° F. add 2%. From Latitude 55° to Latitude 65° subtract 1% for each degree above 55°. From Latitude 55° to Latitude 45° add 1½% for each degree below 55°.

Weather.—In describing the distribution of weather over a district or during an interval of time such as a day, descriptive adjectives are used with the following meanings:—

- Fine—mainly b and bc of the Beaufort notation (see previous page).
- Fair or fair generally—mainly bc and c.
- Cloudy—combinations of bc, c and o, c predominating.
- Overcast—mainly c and o.
- Dull—overcast with low heavy cloud.
- Varying or variable cloud—combinations of b, bc, c, and o.
- Precipitation when occurring is specifically mentioned.

Temperature.—Temperature is specified in degrees Fahrenheit, and is shown on the charts by means of figures written alongside the circles which indicate the positions of the stations.

Maximum and Minimum Temperatures entered in the British Section for Liverpool (Bidston) since 1st March, 1921 have been for the 22 hour period commencing at 9 a.m. the previous day.

Upper Air Temperature.—The actual observations are made normally, one at 1,000 feet above the level of the aerodrome, and the remainder at pressures of 950, 900, 850, 800, etc., millibars. Heights are then computed and, apart from instrumental error, are correct heights: they do not require modification for differences of temperature from normal as these are allowed for in the computation. The values are shown graphically and in tabular form in the Upper Air Supplement. On the diagram, temperatures are given in degrees Fahrenheit and Absolute. The lines marked "Anti-cyclonic," "Cyclonic," "Summer," and "Winter," indicate the normal fall of temperature with pressure under the conditions indicated. The oblique line marked "Adiabatic" shows the lapse rate of temperature for dry air ascending or descending under adiabatic conditions, i.e., without communication of heat from external sources. The lapse rate under these circumstances is very approximately 5.5° F. per 1,000 feet, or 10a per kilometre. A lapse rate greater than this value indicates instability of the atmosphere.

Times of Sunrise, Noon and Sunset.—In compiling the table of Greenwich times of sunrise and sunset for selected stations in the British Section of the Daily Weather Report the mean declination of the sun for noon of each day is taken. No account is taken of the variation in declination on any given day as between leap year and the three following years, the same figures being repeated from year to year without change.

Radio Disturbances (Atmospherics) at Croydon.—In the table under the above heading, information is given concerning atmospherics heard at Croydon. The term "atmospherics" is used to denote the clicks and crashes which are commonly heard in a wireless receiver, the intensity of which varies greatly at different times. Observations at Croydon are made 4 times daily at 1h., 7h., 13h. and 18h. G.M.T.

The second column indicates the type of sound heard, by the following abbreviations:—

- C—Uniform clicks and normal quiet distribution.
- C₁C₂—Clicks of two obviously different orders of intensity.
- Cg—Clicks predominant but a few grinders.
- G—Grinders predominant.
- GG—Continuous grinders whose minimum direction can be found by estimation of intensity without counting.
- Ck—Clicks with a few loud crashes.
- CK—Clicks with numerous crashes.
- KK—Very loud atmospherics.

In the third column the number of atmospherics per 4 seconds is shown. This number is obtained with the receiving coil set in a direction to give the maximum number.

Fourth Column: Strength. From January 1st, 1923, strength has been obtained from the formula $S = \frac{10}{r}$ where r is the resistance in ohms of the shunt necessary to reduce the number of atmospherics heard in the telephone to one quarter of those heard without shunt.

Fifth column. Direction. This indicates the direction from which the maximum intensity of atmospherics is proceeding. Directions are given in degrees (see diagram below).

It is to be noted that there is an ambiguity of 180° in the determination of direction.

Wind.—All wind directions specified in the reports are "true," as distinguished from "magnetic." The arrows indicating wind direction are drawn to fly with the wind. Wind velocities are shown on the charts of the British Section and Upper Air Supplement in m.p.h. by the numbers placed within the small circles. In the International Section velocities are not shown. In both Sections the number of feathers on the arrows denotes wind force by Beaufort number.

Upper Winds.—The direction and velocity of the wind are given in the charts of the Upper Air Supplement for heights of 1,000 feet, 3,000 feet, and 6,000 feet. The data are also given in tabular form for various heights. The reports are usually based on Pilot Balloon ascents.

Wind reports deduced from British Pilot Balloon Ascents refer to the 1,000 feet layers centering at the heights given in the table up to 16,000 feet. When winds are reported at greater heights, they refer to the 5,000 feet layers centering at 20,000 feet, 25,000 feet, 30,000 feet and 35,000 feet.

In the tabular statement direction is specified in degrees from true north measured through East 90°, South 180°, West 270° to North 360°. (See diagram below.)

SUPPLEMENT TO THE DAILY WEATHER REPORT OF THE METEOROLOGICAL OFFICE, LONDON.
SUMMARY OF METEOROLOGICAL OBSERVATIONS AT SELECTED STATIONS ISSUED ON THE 1st DAY OF EACH MONTH.

Notes on the Weather of **AUGUST 1923.**

Near the beginning of the month a deep depression passed across Ireland and Scotland causing high winds on many parts of our coasts and gales in Ireland and Wales. Gusts of between 60 and 70 miles per hour were recorded at several places in these districts on the 2nd.

In the rear of this disturbance high pressure spread up from the South and although further depressions from the Atlantic maintained unsettled conditions in the North and West fine, warm weather prevailed in the Southeast for nearly a fortnight. At Kew there was no measurable rain after 7h. on the 1st until the night of the 14th - 15th while sunshine reports exceeded ten hours almost every day during this period and in fact constituted a record for the first half of August. Temperature rose well above the average and exceeded 80° on several occasions but failed to reach the high figures obtained in July.

On the 14th a shallow depression developed over England causing thunderstorms and heavy rain locally at night as it moved East to the Continent. Meanwhile in the rear of the main depression near Iceland northerly winds brought a supply of cold air to our islands with a consequent drop in temperature. Maximum readings in the South shewed a decrease of about 10° on the 15th.

During the latter half of the month depressions extended their influence to the Southeast counties also, though heavy rainfall was somewhat rare in these parts until the last week. Gales or high winds occurred frequently on the coasts but were particularly severe on the 29th - 30th when a deep depression passed across England, causing strong gales at some inland stations also, while force 10 (average above 55 miles per hour) was experienced in the Scilly Islands and at Spurn Head.

Local thunderstorms occurred in S.E. England on the 18th but were more general about the 22nd-24th and again on the 27th.

Conditions in the first half of the month favoured the development of mist and even thick fog at times in the Channel.

NOTES ON CHART OF ISOPLETHS (p. 4).

The diagram is obtained by drawing a line from Akureyri in Iceland to the South of France, near Marseilles. The points at which the isobars drawn for 4 mb pressure intervals intersect this line at 1h, 7h, 13h, and 19h, are plotted consecutively and joined to show the variation of pressure from day to day at any point in the line. The line terminates at Lat. 56° N., Long. 18° W. in the north, at Lat. 44° N., Long. 4° E. in the south.

* Based in part on reports made by telegraph in which the daily falls are rounded off to the nearest whole millimetre. Small discrepancies may arise between these totals and those given in the Monthly Weather Report which are based on readings taken to 0.1 mm.

GENERAL INFERENCE.

The deep depression off S.W. Ireland seems likely to move north causing unsettled weather in the western districts only. An anticyclone now centred over France and growing in intensity will probably maintain fine, warmer weather elsewhere.

Further Outlook.

Secondary disturbances are likely to cause occasional rain or showers in the West but their influence may not be felt over the eastern half of the Kingdom, where there is a good chance of fine warm weather being maintained over Monday.

EXPLANATION

Isobars are drawn for intervals of two millibars.
Direction is shown by arrows lying with the wind.
Force, on the scale 0-12, is indicated by the number of feathers.
Temperature is shown in miles per hour by figures in small circles.
Temperature is given in °F.

EXPLANATION	
Barometer	Isobars are drawn for intervals of two millibars.
Wind	Direction is shown by arrows flying with the wind.
Force	on the scale 0-12, is indicated by the number of feathers.
Mean velocity	is shown in miles per hour by figures in small circles.
Temperature	is given in °F

GENERAL INFERENCE.

The depression which was off our N.W. coasts yesterday is passing away northeastwards and an anticyclone off the S.W. coast is expanding over our area. Weather will be more settled in the North and is likely to be fine and very warm over the week-end in the South.

Further Outlook.

Fair or fine for a day or two in all districts, very warm in the South.

EXPLANATION

Isobars are drawn for intervals of two millibars.

Direction is shown by arrows flying with the wind.

Force on the scale 0-12 is indicated by the number of feathers.

Temperature is shown in miles per hour by figures in small circles.

TEMPERATURE is given in °F

With present weather is combined, whenever possible, the general character of the weather. A "schdu" divides actual existing weather from preceding conditions, thus: -bc/r= fair weather after rain; i= intermittent; - = "decreasing"; + = "increasing"; h(r) = "hail" or "rain and hail". Capital letters indicate intense, suffix o indicates slight and repetitions of letters continuity, thus: - R = heavy rain. rr = continuous moderate rain. rofo = continuous light rain. CODE FOR STATE OF GROUND.  
 0=Dry ground.  
 1=Wet ground.  
 2=Soft (muddy) wet ground.  
 3=Hard ground frozen (but less than 2 ins. deep).  
 4=Hard ground frozen (but more than 2 ins. deep).  
 5=Dew (or wet grass but not wet ground).  
 6=Slating to-day in 1900 and 1900 reports (Hour frost in 1900 and 1900 reports).  
 7=Snow (this layer, often not continuous).  
 8=Snow (deep, impeding traffic; usually a continuous layer).  
 9=Glazed roads (ice on roads); frozen rain or melted snow.

## BEAUFORT NOTATION OF WEATHER.

b blue sky (not more than a quarter covered).  
 bc sky partly cloudy (one half covered).  
 c generally cloudy (three-quarters covered).  
 d drizzle. h hail. KQ line squall. l lightning. o overcast sky. m mist, visibility 1000-10000 m. f fog. 200-1000 m. p thick fog. less than 200 m. sp precipitation within sight of station.  
 p passing showers. r rain. s snow. re sleet. t thunder. v unusual visibility. y dry air. z dust haze; the turbid atmosphere of dry weather.

With present weather is combined, whenever possible, the general character of the weather. A "solidus" divides actual existing weather from preceding conditions, thus: -bc/r=fair weather after rain; i=intermittent; -="decreasing"; += "increasing"; h(r)= "hail" or "rain and hail"; Capital letters indicate intensity, suffix o indicates slight and repetition of letters continuity, thus: -  
 H = heavy rain.  
 RR = continuous moderate rain.  
 Rr = continuous light rain.

The BEAUFORT SCALE of WIND is used only for surface observations. In the accompanying table the speed of the wind corresponding with the different numbers, is the speed at about 30 feet above the ground.

SEA DISTURBANCE.  
 0=no swell.  
 1=mod. swell.  
 2=heavy swell.  
 3=no swell.  
 4=mod. swell.  
 5=heavy swell.

## GENERAL INFERENCE.

A large, stationary depression, centred Southwest of Iceland, will cause winds mainly from SW. Over the southern half of the Kingdom weather is likely to continue fair or fine and warm, but small secondaries are likely to cause further rain or showers in the North and Northwest.

**BAROMETER.** Isobars are drawn for intervals of two millibars. Direction is shown by arrows flying with the wind. Force, on the scale 0-12, is indicated by the number of feathers. Mean velocity is shown in miles per hour by figures in small circles.

**TEMPERATURE** is given in °F.

EXPLANATION

Isobars are drawn for intervals of two millibars.

Direction is shown by arrows flying with the wind.

Force on the scale 0-12 is indicated by the number of feathers.

Temperature is shown in miles per hour by figures in small circles.

GENERAL INFERENCE.

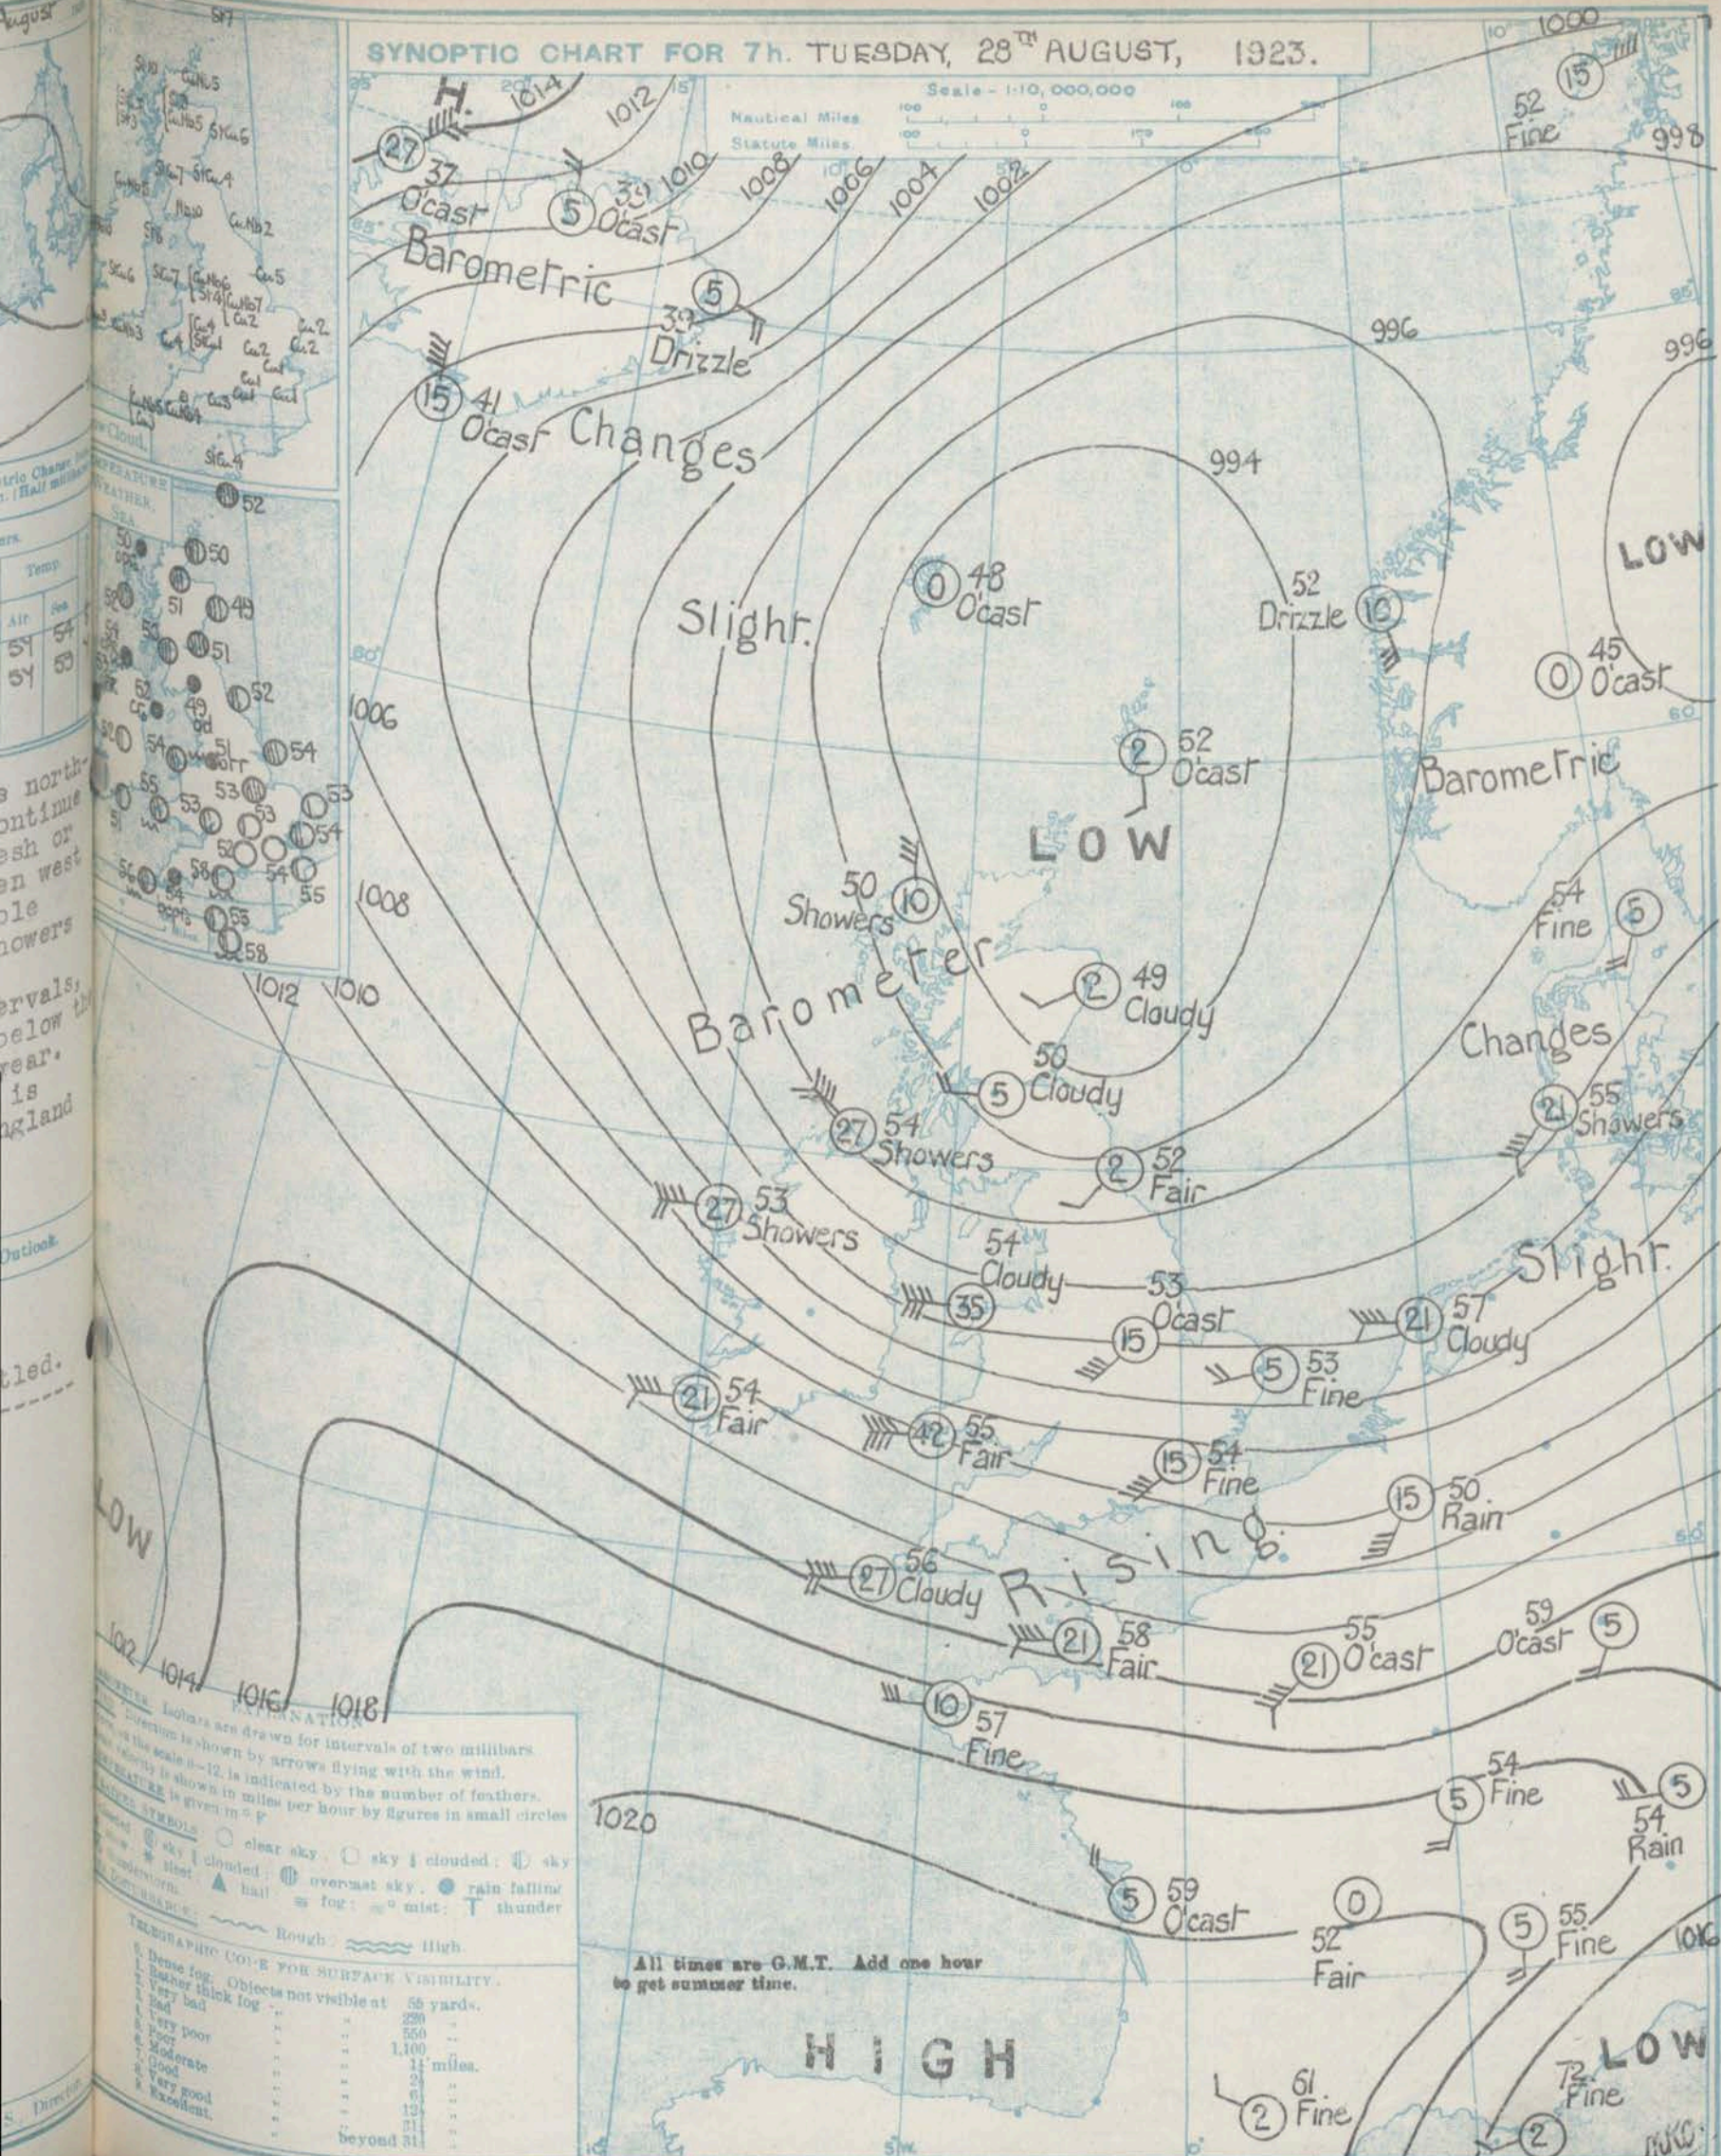

The depression off the north-east of Scotland will continue to move slowly east. Fresh or strong winds from between west and northwest are probable today with occasional showers and local thunder but considerable bright intervals, temperature continuing below normal for the time of year. A temporary improvement is probable over Eastern England after today.

| With present weather is combined, whenever possible, the general character of the weather. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| A "solidus" divides actual existing weather from preceding conditions, thus: bc/r = fair weather after rain; i = intermittent; - = "decreasing"; + = "increasing"; h(?) = "hail" or "rain and hail". | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Capital letters indicate intensity, suffix c indicates slight and repetition of letters continuity, thus: R = heavy rain. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| rr = continuous | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

GENERAL INFERENCE.

The depression recently over England is passing away across the Baltic but a secondary is indicated near the Hebrides. Winds will be from between W. and N.W. strong to a gale locally at first in the South. The weather will be cloudy with intermittent rain in the North while in the South occasional showers are probable with bright periods. Local thunder is probable at first.

EXPLANATION
Isobars are drawn for intervals of two millibars.
Direction is shown by arrows flying with the wind.
Force on the scale 0-12, is indicated by the number of feathers.
Rain velocity is shown in miles per hour by arrows in small circles.
TEMPERATURE is given in °F.
