(INTRODUCTION)

1st January to 31st March, 1968

Stations published in the Daily Weather Report

METEOROLOGICAL OFFICE
Bracknell, Berkshire

I. HISTORY

A brief history of changes in contents and format between 1st April, 1919, and December, 1949, will be found in the introduction to the British Section for 1st October to 31st December, 1949. On 1st January, 1950, the British and International Sections of the former Report, which had been issued in three sections since 1919, were combined in a single publication, the present Daily Weather Report. At the same time, the third section was published separately with the title of Daily Aerological Record. A number of changes in meteorological codes and specifications were introduced on 1st January, 1955, and incorporated in the Report. Changes in format introduced on 1st July, 1955, provided for the elements of station and ships' observations to be given in the order of the appropriate meteorological code and for some modification of the scales and projections of charts. On 1st January, 1961, the Celsius scale was adopted for reporting surface temperatures. On 1st January, 1967, the metric system was adopted for all references to heights and distances. Certain changes relating to position and wave groups in the Ship-Code (FM 21D) were introduced on 1st January, 1968.

2. FORM OF PRESENTATION

(i) **Observations.**—Pages 1 and 4 of the Daily Weather Report contain reports for the four main hours of observation from a representative number of stations in Great Britain and Ireland which provide full reports together with a selection of reports from ocean weather stations for the same hours. In addition, Beaufort letters (Table 20), mainly describing precipitation, are given for each of the four six-hourly periods, together with reports of maximum and minimum temperature, sunshine, rainfall and state of ground (Table 13), in respect of the land stations listed. Explanations of the codes and specifications used are given below.

(ii) **Charts.**—Page 2 contains a chart of the weather in a large part of the northern hemisphere for mid-day of the previous day. Incorporated in this chart is a line joining the approximate locations of civil twilight (i.e., Sun 6° below horizon) at 1200 h G.M.T. for the mid point of the month indicated. Page 3 contains charts of slightly larger scale, for the British Isles and Western Europe, for 1800 h. of the previous day and for 0000 h and 0600 h on the day of issue.

(iii) **General Synoptic Development.**—Below the weather charts on page 3 will be found a statement which describes the main features in the evolution of the synoptic situation over the United Kingdom during the preceding 24 hours together with an indication of the manner in which it is expected to develop.

3. NOTES

(i) **Standard of Time.**—Greenwich Mean Time is exclusively used throughout the Report.

(ii) **Rainfall.**—Tr. = There has been precipitation, but amount less than 0.05 mm.

(iii) **Temperature.**—On pages 1 and 4 temperature is specified in whole degrees Celsius, negative temperatures being coded by removing the minus sign and adding 50. Equivalent values in degrees Fahrenheit can be obtained by reference to the table printed between these pages.

(iv) **Dew Point.**—The values of Dew Point are derived from the original readings of dry-bulb and wet-bulb temperature and are correct to 1° C. Prior to 1st January, 1949, values below 0° C gave the "Hoar Frost Point" that is to say, the temperature for which the actual vapour pressure is equal to the saturation pressure over ice. Since January, 1949, the true Dew Point and not the Hoar Frost Point has been included in synoptic reports in circumstances where the actual vapour pressure is lower than the saturated water vapour pressure of 0° C.

(v) **Adjusted Readings.**—Where an instrumental reading is found to be in error and some adjustment is necessary, the adjusted reading is published in brackets thus (59).

(vi) **Rainfall Readings in Eire.**—The rainfall totals for stations in Eire are for the periods

18h–06h G.M.T., reported at 0900h G.M.T.,
06h–18h G.M.T., reported at 2100h G.M.T.

(vii) Readers of the Report who are unacquainted with the method of construction and the use of weather charts are recommended to read "The Weather Map. An introduction to weather forecasting" (Fourth edition, Second impression 1959), which may be purchased from H.M. Stationery Office, 49 High Holborn, London, W.C.1, price 13s. 6d. post free.

0 = No stratocumulus, stratus, cumulus or cumulonimbus.	0 = No altocumulus, altostratus or nimbostratus.	0 = No cirrus, cirrocumulus or cirrostratus.	Code figure
1 = Ragged cumulus other than of bad weather, or cumulus with little vertical extent and seemingly flattened, or both.	1 = Altostratus, the greater part of which is semi-transparent; through this part the sun or moon may be weakly visible as through ground glass.	1 = Cirrus in the form of filaments, strands or hooks, not progressively invading the sky (often called "mares' tails").	Height of base of cloud
2 = Cumulus of moderate or strong vertical extent, generally with protuberances in the form of domes or towers, either accompanied or not by other cumulus or by stratocumulus: all having their bases at the same level.	2 = Altostratus, the greater part of which is sufficiently dense to hide the sun (or moon), or nimbostratus.	2 = Dense cirrus, in patches or entangled sheaves, which usually do not increase and sometimes seem to be the remains of the upper part of a cumulonimbus: or cirrus with sproutings in the form of towers or battlements, or having the appearance of cumuliiform tufts.	metres
3 = Cumulonimbus, the summits of which, at least partially, lack sharp outlines, but are neither clearly fibrous (cirriform) nor in the form of an anvil: cumulus, stratocumulus or stratus may also be present.	3 = Altocumulus, the greater part of which is semi-transparent, and no part of which is crenelated or in cumuliiform tufts: the various elements of the cloud change only slowly and are all at a single level.	3 = Dense cirrus, often in the form of an anvil: either the remains of the upper parts of a cumulonimbus or parts of distant cumulonimbus, the cumuliiform portions of which cannot be seen.	0-50
4 = Stratocumulus formed by the spreading out of cumulus: cumulus may also be present.	4 = Patches (often in the form of almonds or fishes) of altocumulus, the greater part of which is semi-transparent; the clouds are at one or more levels and the elements are continually changing in appearance.	4 = Cirrus in the form of hooks or of filaments, or both, progressively invading the sky: they generally become denser as a whole.	50-100
5 = Stratocumulus not resulting from the spreading out of cumulus.	5 = Semi-transparent altocumulus in bands or altocumulus in one more or less continuous layer progressively invading the sky: these altocumulus clouds generally are growing denser as a whole. The layer may be opaque or may consist of two or more sheets.	5 = Cirrus, often in bands converging towards one point or two points of the horizon, and cirrostratus, or cirrostratus alone: in either case, they are progressively invading the sky, and generally growing denser as a whole, but the continuous veil does not reach 45 degrees above the horizon.	100-200
6 = Stratus in a more or less continuous sheet or layer, or in ragged shreds, or both, but no stratus fractus of bad weather.	6 = Altocumulus resulting from the spreading out of cumulus.	6 = Cirrus, often in bands converging towards one point or two points of the horizon, and cirrostratus, or cirrostratus alone: in either case, they are progressively invading the sky, and generally growing denser as a whole: the continuous veil extends more than 45 degrees above the horizon, without the sky being totally covered.	200-300
7 = Stratus fractus of bad weather or cumulus fractus of bad weather (pannus), or both: usually below altostratus or nimbostratus. By "bad weather" is meant the conditions which generally exist before, during or after precipitation.	7 = Any one of the following cases:— (a) Altocumulus in two or more layers, usually opaque in places and not progressively invading the sky. (b) Opaque layer of altocumulus not progressively invading the sky. (c) Altocumulus together with altostratus or nimbostratus or both.	7 = Veil of cirrostratus completely covering the celestial dome.	300-600
8 = Cumulus and stratocumulus, other than those formed from the spreading out of cumulus: the base of cumulus is at a different level from that of stratocumulus.	8 = Altocumulus with sprouts in the form of small towers or battlements, or altocumulus having the appearance of cumuliiform tufts.	8 = Cirrostratus not progressively invading the sky and not completely covering the celestial dome.	600-1,000
9 = Cumulonimbus, the upper part of which is clearly fibrous (cirriform), often in the form of an anvil: either accompanied or not by cumulus, stratocumulus, stratus or pannus.	9 = Altocumulus, generally at several levels, in a chaotic sky: dense cirrus is usually also present.	9 = Cirrocumulus alone or cirrocumulus accompanied by cirrus or cirrostratus, or both, but cirrocumulus is the predominant cirriform cloud.	1,000-1,500
/ = Stratocumulus, stratus, cumulus and cumulonimbus are invisible owing to darkness, fog, blowing dust or sand, or other similar phenomena.	/ = Altocumulus, altostratus and nimbostratus are invisible owing to darkness, fog, blowing dust or sand, or other similar phenomena, or more often because of the presence of a continuous layer of lower clouds.	/ = Cirrus, cirrocumulus and cirrostratus are invisible owing to darkness, fog, blowing dust or sand, or other similar phenomena, or more often because of the presence of a continuous layer of lower clouds.	1,500-2,000
			2,000-2,500
			Above 2,500
			Height of base of cloud not known or base of clouds at a level lower and tops at a level higher than that of the station.
			Note 1.—If there is no cloud at all code figure 9 is reported.
			Note 2.—If there is fog, and the sky is discernible through the fog, the cloud form, height and amount are reported as if no fog were present. If the sky is not discernible through the fog the height of the base of the cloud is reckoned as 0.
			Note 3.—Height above ground of the base of cloud. If there is cloud of Form CL reported, h refers to this cloud. If, however, there is no cloud of Form CL and there is cloud of Form CM h refers to this cloud.

WET IN NORTHWEST - DRY IN SOUTHEAST

An anticyclone positioned to the west or southwest of the British Isles was the prevailing pressure feature of the first twelve days of March. The flow around the northern and eastern flanks of this anticyclone carried weak fronts with periods of rain or snow mainly to northern and eastern parts of the country. The associated depressions tracked southeastwards to the north and east of the British Isles, approaching closely enough to give northerly gales along the east coast on the 6th. On the 13th the anticyclone became displaced towards the Azores and a series of quite vigorous troughs of low pressure, associated with depressions mainly to the north of Scotland moved eastwards across the British Isles during the next few days giving westerly gales in many areas, especially on the 17th. From 25th high pressure, developing over the European continent, established anticyclonic conditions over most of England whilst weak frontal activity affected Scotland and some parts of Wales and northern England. Some rain also occurred in the south on 30th.

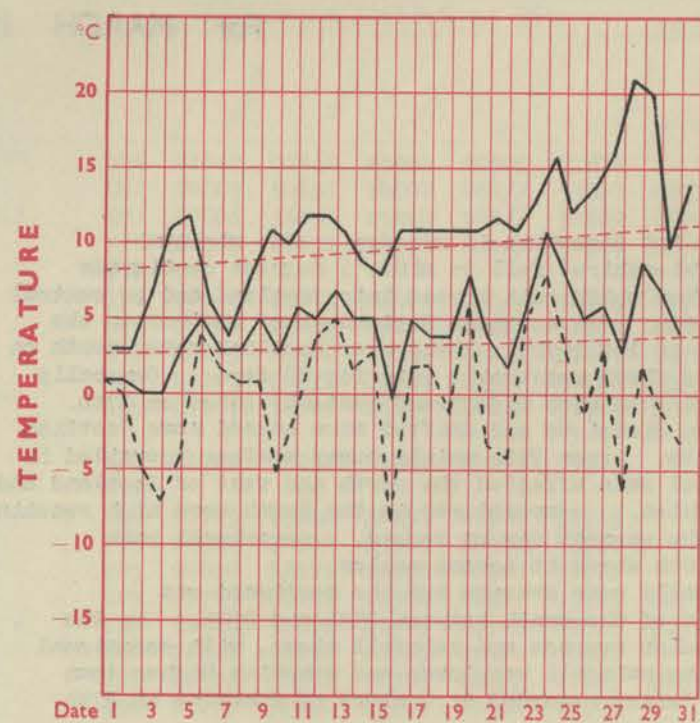

The first two days of the month were generally dry although parts of eastern England had a little rain or drizzle at times. It was cold with overnight frost in many places. Rain spread into Scotland on the 3rd and 4th dying out as it spread into northern England on 5th. During these 3 days it was very mild in the Midlands and south. Gales with snow showers and isolated thunderstorms affected eastern England on the 6th when at Whitby (Yorks) a gust to 90 kts (104 mph) was reported. Showers continued

over east England on 7th and 8th but elsewhere it was dry. The minimum temperature at Eskdalemuir (Dumfriesshire) fell to minus 6 degrees centigrade (21F) on the night of the 8th after which rain spread into Scotland and to central and eastern England on 9th and 10th. In southern England sunny weather on the 11th allowed temperature to rise to 14C (57F). Rain over Scotland moved south on 13th to give Chivenor (Devon) its first measurable rain for 28 days. Generally unsettled weather continued until 24th with widespread westerly gales on 17th. Snow or hail occurred in northern districts and drifted snow caused some Scottish roads to become impassable on 17th. From 25th mainly sunny weather prevailed in the south but cloud and occasional rain affected the north and west of Scotland and parts of northwest England and Wales. Temperatures in the south were high reaching 25C 76F at Mildenhall on 29th, the warmest day on record. Occasional rain affected southern districts on 30th where it became cooler.

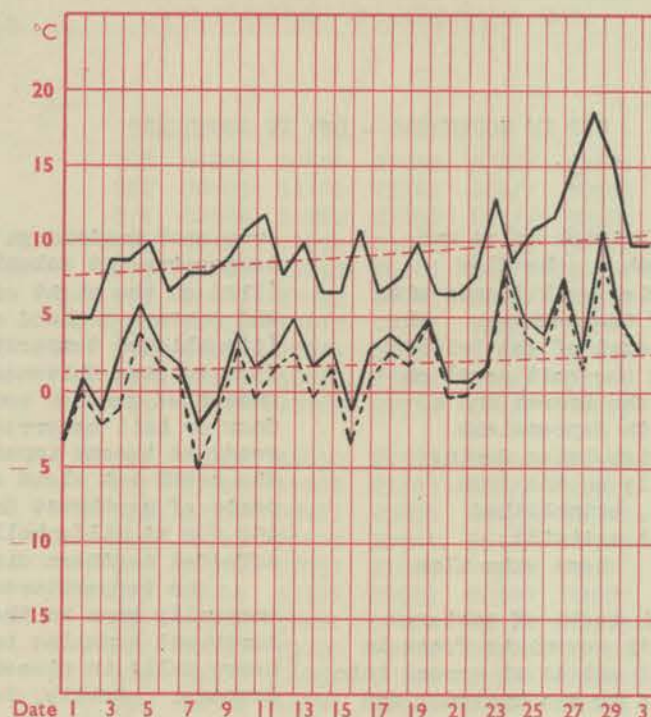

The temperatures were generally near average but the southeast was unusually warm in the latter part of the month between 25th and 29th. In the northwest sunshine totals were below average and rainfall above, with occasional heavy falls in places. Elsewhere rainfall was lower and sunshine higher than average. Scilly, Southsea and Jersey recorded 11.6 hours of sunshine on 27th.

CHART OF WEATHER IN PART OF NORTHERN HEMISPHERE

CHARTS OF WEATHER IN WESTERN EUROPE

GENERAL SYNOPTIC DEVELOPMENT

The anticyclone which was centred over the North Sea has moved east into Russia but a ridge of high pressure is expected to be maintained across the British Isles to link with another anticyclone developing over the Atlantic. The occlusion which extended southwards to the west of the British Isles has now

become weak and ill defined in the south while the northern front moved east into Scandinavia. The depression and frontal systems to the west of Spain will move slowly southeastwards.

Issued at midday Friday 1

CHART OF WEATHER IN PART OF NORTHERN HEMISPHERE

CHARTS OF WEATHER IN WESTERN EUROPE

GENERAL SYNOPTIC DEVELOPMENT

The anticyclone over western Russia has continued to drift slowly eastwards but a ridge of high pressure has been maintained across northern districts of the British Isles to the intensifying anticyclone in mid-Atlantic. Little change is expected during the next 24 hours, although the high to the west of Britain

is expected to drift slowly northeastwards. The depression which was centred just west of Portugal yesterday morning moved southeast over southern Spain and filled slowly, while a new centre which formed on the occlusion moved eastwards over the Mediterranean.

Issued at midday Saturday 2

GENERAL SYNOPTIC DEVELOPMENT

The British Isles have been under the influence of a col area between anticyclones over Russia and over the eastern Atlantic. The Atlantic high pressure is extending eastwards and southwards, allowing a stronger westerly flow

into Northern Scotland. Elsewhere over the country a rather unstable northwesterly airstream will prevail.

Issued at midday Sunday 3 March 1968

GENERAL SYNOPSIS DEVELOPMENT

CHART OF WEATHER IN PART OF NORTHERN HEMISPHERE

CHARTS OF WEATHER IN WESTERN EUROPE

Polar Stereographic projection
one standard parallel at 60°N. Scale: 15m

GENERAL SYNOPTIC DEVELOPMENT

The anticyclone continues slow moving to the southwest of Ireland. The depression which was east of Iceland moved southeast into Scandinavia and filled. Another wave depression formed near O.W.S. 'A' and moved northeast then eastward to the east of Iceland, and the associated cold front has penetrated into

central Scotland. During the next 24 hours the depression will move southeast towards the southern Baltic. The cold front will move quickly southeast across the North Sea and will clear most of England and Wales, later returning as a warm front over northern Ireland and western Scotland.

CHART OF WEATHER IN PART OF NORTHERN HEMISPHERE

CHARTS OF WEATHER IN WESTERN EUROPE

GENERAL SYNOPTIC DEVELOPMENT

The large anticyclone is almost stationary to the west of Ireland. The depression which moved east across Iceland turned south over Scandinavia into the Baltic while the associated cold front quickly cleared England and Wales as a weak feature and a strong northwesterly gradient became established over the British Isles and the North Sea. The gradient has been veering northerly as the depression continues

moving southeastward and pressure builds to the north of Scotland. As the depression continues into eastern Europe the gradient will veer northeasterly and slacken over western districts but will remain strong over the eastern North Sea. The warm front moving east towards Scotland is a weak pattern.

GENERAL SYNOPTIC DEVELOPMENT

Issued at midday Thursday 7 March 1968

The large anticyclone to the west of Ireland has moved little, and will persist over the next 24 hours. A depression over the western Baltic yesterday morning moved south into Germany and southwest into France, bringing storm force winds

to the North Sea and many eastern parts of England. The depression is now filling and moving to the Mediterranean, and gales will soon be confined to the English Channel area.

GENERAL SYNOPTIC DEVELOPMENT

The anticyclone to the west of Ireland continues to drift slowly southwards. The northerly airstream has been a rather mild one over most of the country, but colder over the Shetlands and North Sea. The milder air has now extended to all

areas and will persist for the next 24 hours. A trough with strengthening wind is expected to reach northwest Scotland later.

CHARTS OF WEATHER IN WESTERN EUROPE

Polar Stereographic projection

GENERAL SYNOPTIC DEVELOPMENT

The depression which yesterday was near O.W.S. 'A' has moved east-southeast as a complex feature and now lies to the north and northeast of Scotland. This depression is expected to continue moving east-southeast towards Denmark with the associated occlusion which crossed the British Isles during the past 24 hours also moving away eastwards. A rather cold and strong northwesterly airstream covers

the country now the occlusion has passed but a frontal system over the western Atlantic is likely to bear quickly eastwards with a warm front wave moving over Ireland into southwest England tonight. At the same time winds over the north of the country are expected to veer more northerly.

Issued at midday Friday 15

GENERAL SYNOPSIS DEVELOPMENT

The depression yesterday morning over the northern North Sea has moved to the Baltic and filled, whilst the Azores anticyclone has declined slightly. An intense and still deepening depression has moved out from the South Greenland

coast during the last 24 hours and is expected to move to the southeast of Iceland. Its associated trough will swing across the country, and gales will develop in many areas especially in the north.

GENERAL SYNOPTIC DEVELOPMENT

The depression off the east coast of Greenland has deepened rapidly, and two centres, southwest and east of Iceland, have developed. The associated fronts are crossing the British Isles and there are gale force winds in all areas. The

two low centres are expected to move towards the coast of Norway, allowing troughs in the cold air to sweep across the country and winds will remain gale force in all areas.

Issued at midday Sunday 17 March 1968

GENERAL SYNOPTIC DEVELOPMENT

The cold front had cleared southern England by dawn and a very strong westerly gradient affected all areas during the day. Winds reached storm force in places in Northern Britain. The associated low pressure area south of Iceland moved

steadily east with a trough on its southern side which crossed Scotland late in the day. The strong westerly flow is expected to moderate slowly today as the depression continues to move east over South Norway.

Issued at midday Monday 18 March 1968

CHART OF WEATHER IN PART OF NORTHERN HEMISPHERE

CHARTS OF WEATHER IN WESTERN EUROPE

GENERAL SYNOPTIC DEVELOPMENT

The depression which passed south of Iceland yesterday is moving slowly east towards the Faeroes and a trough is developing southwest of the centre. The frontal system over Ireland at 0600 is expected to move rapidly across England and

over the North Sea but a wave seems likely to form on the cold front west of France tonight. The strong to gale force west-southwest airflow will continue to bring rather cold unstable air over the British Isles.

Issued at midday Monday 19 March 1968

CHART OF WEATHER IN PART OF NORTHERN HEMISPHERE

CHARTS OF WEATHER IN WESTERN EUROPE

GENERAL SYNOPTIC DEVELOPMENT

The depression which passed the Faroes yesterday turned northeast and a secondary formed some 500 miles to the west of north Scotland. While the main centre is expected to continue moving northeast the secondary will move east towards north Scotland. The frontal system which moved into Ireland yesterday developed a minor

wave and its progress was retarded but the cold front is now expected to clear southern England by early afternoon leaving the British Isles in a cold unstable airstream with the strongest flow in the south.

Issued at midday Wednesday 20 March 1968

GENERAL SYNOPTIC DEVELOPMENT

A complex low pressure area with the main centre to the northeast of Thorshavn and several centres to the west of Scotland, has been generally slow-moving. However small lows have broken away from this complex, forming troughs, which have moved east across most southern and central areas of the British Isles. The

trough lying over western districts of England and Wales yesterday morning, moved into the North Sea by midday. A further trough is expected to move northeast across much of England and southern Scotland, to be followed by a return to an unstable west or southwest airstream.

Issued at midday Thursday 21

GENERAL SYNOPTIC DEVELOPMENT

The complex low pressure area which yesterday had main centres to the northeast of Thorshavn and to the west of Scotland has continued to be slow moving. The depression now situated to the southwest of Norway formed troughs which moved across the British Isles during yesterday. This depression is expected to move up the Norwegian coast today. A developing wave now approaching O.W.S. 'J' is

expected to travel east moving into southwestern parts of the British Isles tonight, preceded by a weak ridge of high pressure. The low situated to the southwest of Iceland is expected to continue moving southeast to form a complex low with the developing wave.

GENERAL SYNOPTIC DEVELOPMENT

A deep and complex depression persists south of Iceland and a deepening secondary depression which moved across Rockall overnight has turned left and is merging with the main centre. A warm front is moving quickly across the North Sea but the cold front from southern Scotland to southwest Ireland is delayed by the development of waves. Cold frontal movement across the country is likely to be

irregular and the front seems unlikely to clear the southeast of England before tomorrow morning. Areas to the southeast of the front remain in a rather mild but very moist southwesterly flow and the deep cold unstable air mass over the Atlantic will be slow to extend across the British Isles.

Issued at midday Saturday 23 March 1968

GENERAL SYNOPTIC DEVELOPMENT

The complex depression which was south of Iceland yesterday has now amalgamated into a single slow-moving centre near O.W.S. 'R'. The warm front which moved quickly northeast into Scandinavia will continue moving northeastwards. The cold

front which has a series of minor ripples running northeast along it will continue to move slowly east and is now expected to clear southeast England by tomorrow morning bringing an unstable airstream over all districts of the British Isles.

GENERAL SYNOPTIC DEVELOPMENT

The depression which was south of Iceland yesterday has split into two. The main centre southeast of O.W.S. 'I' is slow moving with a trough extending south into Rockall and Sharnon. The subsidiary centre has moved steadily northeastwards towards O.W.S. 'M'. The cold front which has been affecting the British Isles cleared East Anglia and Kent soon after midnight leaving a general

southwesterly flow over the country which is light in Scotland, Wales and the North, and moderate to fresh with some showers in the south and east. The main depression is expected to fill and move north as an intensifying ridge of high pressure approaches western districts.

GENERAL SYNOPTIC DEVELOPMENT

Issued at midday Wednesday 27 March 1968

The anticyclone which formed over Biscay yesterday morning has drifted slowly into Germany while the deep low to the southwest of Iceland has moved slowly northeast. The warm front associated with this depression crossed northern and central districts of the British Isles yesterday afternoon and evening and a mild southwesterly airstream now covers all parts of the British Isles. During the next

24 hours the cold front is expected to move slowly south across Scotland but otherwise there will be little change in the synoptic situation, with the anticyclone continuing to move east into eastern Europe and the deep depression moving northeast across Iceland.

GENERAL SYNOPTIC DEVELOPMENT

Pressure has continued to rise in the Iceland area as the main centre of low pressure is transferred towards northern Norway. The anticyclone over the continent drifted slowly eastwards. The cold front which yesterday was off the northwest of Scotland moved slowly southeast and is now almost stationary with

minor ripples running northeast along it. Little change is expected over the next 24 hours with the cold front remaining over central Scotland and northern Ireland and the anticyclone over Europe maintaining a southerly flow over England and Wales.

Issued at midday Thursday 28 March 1968

GENERAL SYNOPTIC DEVELOPMENT

The pressure remains low between Iceland and Norway while anticyclones persist in the central Atlantic and over Europe. The cold front is almost stationary over Scotland and the west of Ireland, and a trough extends north-south over the

western half of the country. During the next 24 hours the trough will move slowly eastwards and the country will be affected by its associated weak frontal systems but little change in the general pattern is expected.

GENERAL SYNOPTIC DEVELOPMENT

The anticyclone over Europe has weakened whilst the anticyclone near the Azores has intensified northeastwards. This has allowed the hitherto slow moving cold front over northwestern parts of the British Isles to move more quickly southeast across England and Wales. An intense depression has moved north-northeast across

the western Atlantic. This depression is expected to continue its northward motion with its associated frontal trough moving northeast preceded by a ridge of high pressure will cover most of the British Isles on Sunday.

Issued at midday Saturday 30 March 1968

GENERAL SYNOPTIC DEVELOPMENT

The anticyclone northeast of the Azores has moved slowly eastwards over the last 24 hours and is expected to turn southeast. The ridge over the British Isles has moved south and will continue into the Continent. The deep west-Atlantic

depression is expected to extend a breakaway low towards the British Isles. This will bring a return of mild southwesterly winds to much of the country, although Scotland may retain colder winds from a northerly point.
