THE BEAUFORT SCALE OF WIND FORCE.

| Beaufort Number. | Admiral Beaufort's General Description of Wind. | Specification for use on Land, based on observations made at Land Stations. | Limits of Mean Velocities Statute Miles per Hour. |
|------------------|---|---|---|
| 0 | Calm | Calm; smoke rising vertically | Less than 1 |
| 1 | Light air | Direction of wind shown by smoke drift | 1-3 |
| 2 | Slight breeze | Wind felt on face; leaves rustle | 4-7 |
| 3 | Gentle breeze | Leaves and small twigs in constant motion; wind extends light flag | 8-12 |
| 4 | Moderate wind | Raises dust and loose paper; small branches are moved | 13-18 |
| 5 | Fresh wind | Small trees in leaf begin to sway; crested wavelets on inland waters | 19-24 |
| 6 | Strong wind | Large branches in motion; whistling heard in telegraph wires | 25-31 |
| 7 | High wind | Whole trees in motion; inconvenience felt when walking against wind | 32-38 |
| 8 | Gale | Breaks twigs off trees; generally impedes progress | 39-46 |
| 9 | Strong gale | Slight structural damage occurs (chimney pots and slates removed) | 47-54 |
| 10 | Whole gale | Seldom experienced inland; trees uprooted | 55-63 |
| 11 | | Very rarely experienced; accompanied by widespread damage | 64-75 |
| 12 | Hurricane | | Above 75 |

GALE WARNINGS.

The Meteorological Office issues warnings to ports and fishing stations of gales on or near the coasts of the British Isles. When one of these notices has been received at a station a black canvas cone is hoisted.

The South Cone (point downwards) is hoisted for gales from S.E., veering to S.W., W. or N.W.
 " S.W., veering to W. or N.W.
 " W., veering to N.W.
 " E., veering to S. or S.W.

The North Cone (point upwards) is hoisted for gales from S.E., E. or N.E., backing to N.
 " N.W., veering to N., N.E. or E.
 " N., veering to N.E. or E.
 " N.E., veering to E.

The Signals remain hoisted after the receipt of a warning telegram until danger of a gale is passed.

The Districts to which warnings are sent are shown in the British Section of the Daily Weather Report by the following symbols:—

▼ South Cone hoisted.
 ▲ North " "

BEAUFORT NOTATION OF WEATHER.

b blue sky (not more than a quarter covered).
 bc sky partly cloudy (one half covered).
 c generally cloudy.
 d drizzle. h hail. KQ line squall.
 l lightning. o overcast sky.
 m mist, visibility 1000-10000 m.
 n fog. 200-1000 m.
 F thick fog. less than 200 m.
 p precipitation within sight of station.
 r passing showers. r rain.
 s snow. re sleet. t thunder.
 v unusual visibility. y dry air.
 z dust haze; the turbid atmosphere of dry weather.

With present weather is combined, whenever possible, the general character of the weather. A "solidus" divides actual existing weather from preceding conditions, thus: bc/r = fair weather after rain; i = intermittent; - = "decreasing"; + = "increasing"; h(r) = "hail" or "rain and hail"; Capital letters indicate intensity, suffix o indicates slight; and repetition of letters continuity, thus:—
 R = heavy rain.
 rr = continuous moderate rain.
 rro = continuous light rain.

NOTES ON THE INFORMATION CONTAINED IN THE BRITISH AND INTERNATIONAL SECTIONS OF THE DAILY WEATHER REPORT.

Heights of Stations.—The heights of British Stations above M.S.L. published in the British Section of the Daily Weather Report refer to the plot of ground on which the rain gauge is situated.

Pressure.—The distribution of barometric pressure at Mean Sea Level is shown by means of isobars which are drawn for intervals of 2 millibars on the British Section of the Report and for intervals of 4 millibars on the International Section.

The wind at a height of 1,500-2,000 feet above ground usually blows along the isobars and, for the same temperature, pressure and latitude, the speed of the wind is inversely proportional to the distance between the isobars, e.g., for isobars 1 inch apart (160 miles) in the Daily Weather Report the speed of the upper wind is about 12 m.p.h. in latitude 55°, with a temperature of 50° F. and a pressure of 1,015 mb; if, however, the isobars are $\frac{1}{2}$ inch apart the corresponding speed is 24 m.p.h.

The scale below can be used with both the International and the British Sections. If the distance between consecutive isobars is measured along the rule from the left-hand extremity the geostrophic wind is shown by the scale in miles per hour.

GEOSTROPHIC WIND SCALE FOR

4 mb isobars on 1 : 2 × 10⁷ Charts.
or 2 mb " " 1 : 10⁷ " "
or 1 mb " " 1 : 5 × 10⁶ " "

This scale applies under the following conditions:—

Pressure, 1,015 mb. Temperature, 50° F. Latitude, 55°.

Corrections.—For an increase of 10 mb pressure, subtract 1% from velocity; for an increase of 10° F. add 2%. From Latitude 55° to Latitude 65° subtract 1% for each degree above 55°. From Latitude 55° to Latitude 45° add 1½% for each degree below 55°.

Temperature.—Temperature is specified in degrees Fahrenheit, and is shown on the charts by means of figures written alongside the circles which indicate the positions of the stations.

Relative Humidity.—From January 1st 1926, relative humidity at British stations has been calculated from the following hygrometric formulae:

$$x = f - .444(t - t') \text{ for wet bulb readings above } 32^\circ \text{ F.}$$

$$x = f - .400(t - t') \text{ for wet bulb readings below } 32^\circ \text{ F.}$$

where x is the vapour pressure in mb.;

f the saturation vapour pressure at the temperature of the wet bulb;

t the dry bulb temperature; and

t' " wet "

The use of Glaisher's tables has been discontinued.

The tables, used for calculating humidities from the readings of the dry and wet bulb thermometers on aeroplanes, are based on a formula similar to the above, but allowance is made for variation of barometric pressure with height and for the increased ventilation of the thermometers.

Upper Air Temperature.—The British observations are made normally, one at 1,000 feet above the level of the aerodrome, and the remainder at pressures of 950, 900, 850, 800, etc., millibars. Heights are then computed and, apart from instrumental error, are correct heights: they do not require modification for differences of temperature from normal as these are allowed for in the computation. The values are shown graphically and in tabular form in the Upper Air Supplement. On the diagram, temperatures are given in degrees Fahrenheit and Absolute. The oblique line marked "Dry Adiabatic" shows the lapse rate of temperature for dry air ascending or descending under adiabatic conditions, i.e., without communication of heat from external sources. The lapse rate under these circumstances is very approximately 5.5° F. per

1,000 feet, or 10°a per kilometre. A lapse rate greater than this value indicates instability in a dry atmosphere.

The broken lines marked Saturated Adiabatic show lapse rates for saturated air. These are for air masses which contain just sufficient moisture at 1,015 mb. pressure to become saturated after rising 1 km. in an environment having the dry adiabatic lapse rate. The condensed moisture is assumed to be retained thereafter in the air as it rises.

Times of Sunrise, Noon and Sunset.—From January 1st, 1926, the times of Sunrise, Noon and Sunset published in the British Section of the Report for certain stations have been recalculated from (1) the figures for the duration of sunshine contained in the International Meteorological Tables and (2) the value of the sun's declination and the equation of time published in the Nautical Almanac. The change of declination of the sun on the same day from year to year over a cycle of four years is now taken into account. This change has formerly been neglected, as stated in previous issues of Form 2373.

Wind.—All wind directions specified in the reports are "true," as distinguished from "magnetic." The arrows indicating wind direction are drawn to fly with the wind. Wind velocities are shown on the charts of the British Section and Upper Air Supplement in m.p.h. by the numbers placed within the small circles. In the International Section velocities are not shown. In both Sections the number of feathers on the arrows denotes wind force by Beaufort number.

Upper Winds.—The direction and velocity of the wind are given in the charts of the Upper Air Supplement for heights of 2,000 feet and 6,000 feet. The data are also given in tabular form for various heights. The reports are usually based on Pilot Balloon ascents.

Wind reports deduced from British Pilot Balloon Ascents refer to the 1,000 feet layers centering at the heights given in the table up to 16,000 feet. When winds are reported at greater heights, they refer to the 5,000 feet layers centering at 20,000 feet, 25,000 feet, 30,000 feet and 35,000 feet.

In the tabular statement direction is specified in degrees from true north measured through East 90°, South 180°, West 270° to North 360°. (See diagram below.)

Sea Disturbance.—The code for sea disturbance used at coastal stations is given on p. 1 of the British Section of the Report. Ships at sea use the following code:—

- | | | | |
|-----------------------|--|-----------------------|--------------------------------------|
| 0. No or slight swell | } and { Sea smooth to moderate. | 5. No or slight swell | } and { Sea rough or above. |

SUPPLEMENT TO THE DAILY WEATHER REPORT OF THE METEOROLOGICAL OFFICE, LONDON.
SUMMARY OF METEOROLOGICAL OBSERVATIONS AT SELECTED STATIONS ISSUED ON THE 1st DAY OF EACH MONTH.

Notes on the Weather of **APRIL,** 1926.

Perhaps the most outstanding feature of the weather of the month was the short spell of unusually hot weather at Easter. Under the influence of light southerly breezes between an anticyclone over the Continent and a depression on the Atlantic temperature rose to about 70° in many places during the first few days: 72° at Kew Observatory on the 2nd. was the highest reading there in the first half of April since 1871, while 76° at Galden on the 4th (Easter Sunday) was the highest on record there for the whole of April. Meanwhile a secondary depression was moving northeast from the Bay of Biscay and caused heavy local rain and thunderstorms in some southern districts on the 4th - 5th.

Subsequently temperature fell gradually but on the whole remained above the average until the middle of the month. Further secondary depressions caused a fair amount of rain in southern England about the 7th - 8th but an anticyclone which passed across the British Isles during the next few days gave a short spell of dry, sunny weather with local frost at night.

The approach of a depression from the Atlantic caused a renewal of unsettled weather about the 14th. Much rain fell repeatedly and secondaries near the southwest coasts were associated with high winds at times. Pressure soon became low to the northward or eastward of the British Isles, giving more northerly winds and changeable, showery weather with local thunderstorms and hail. Day temperatures were rather low in the southeast from the 20th - 26th during which period the thermometer did not rise above 53° at Kew Observatory.

A depression over the western Mediterranean on the 24th moved northwards causing high winds and gales in and near the southern part of the North Sea on the 25th and considerable rain in eastern England and Scotland on the 25th-26th. Warmer air from the Continent caused a rise of temperature during the last few days though the weather remained generally unsettled with some further local thunderstorms.

Compared with the average the month was decidedly dull and wet in some eastern districts but sunnier than usual in some parts of southwest England and Ireland.

NOTES ON CHART OF ISOPLETHS (p. 4).

The diagram is obtained by drawing a line from Akureyri in Iceland to the South of France, near Marseilles. The points at which the isobars drawn for 4 mb pressure intervals intersect this line at 1h, 7h, 13h, and 19h, are plotted consecutively and joined to show the variation of pressure from day to day at any point in the line. The line terminates at Lat. 60° N., Long. 18° W. in the north, at Lat. 44° N., Long. 4° E. in the south.

* Based in part on reports made by telegraph in which the day & night measurements are rounded off to the nearest whole millimetre. Small discrepancies may arise between these totals and those given in the Monthly Weather Report which are based on readings taken to 0.1 mm.

GENERAL INFERENCE.

The large Atlantic depression has moved north and is filling up, but further secondaries will probably move north off western coasts, causing further strong winds and rain near the western seaboard. An anticyclone over the Continent will maintain fair to fine weather in eastern districts.

EXPLANATION.
Barometer.—Isobars are drawn for intervals of two millibars.
Wind.—Direction is shown by arrows pointing with the wind. Force, on the scale 0-12, is indicated by the number of lines. Mean velocity is shown in miles per hour by figures in small circles.
Temperature is given in degrees F.

GENERAL INFERENCE.

A large anticyclone is centred over the Baltic area, and pressure remains low over large area in the Atlantic. A secondary depression developing over the Bay of Biscay will move north, with local thunderstorms or thundery rains. Mainly fair weather is likely to continue, and though temperature will probably fall somewhat, it will continue high for the time of year.

GENERAL INFERENCE.

An anticyclone continues to spread northeastwards from the Bay of Biscay. A deep depression extends from Greenland down into the tropics and the southern winds reaching Western Europe are likely to be drawn from near the west coast of Africa. Summer weather is expected to continue for several days with local thundery rains, but sunny weather predominating over England and Eastern Scotland.

GENERAL INFERENCE.

An anticyclone covers most of the British Isles and will maintain fine warm weather over England and eastern Scotland with fog at times nearly everywhere. A depression west of Ireland is likely to move very slowly north and will maintain strong southerly winds over Ireland and western Scotland with local rain.

Further Outlook.

▼ Mainly fair over eastern Scotland but local thunderstorms; rather unsettled in the West, but considerable fair periods.

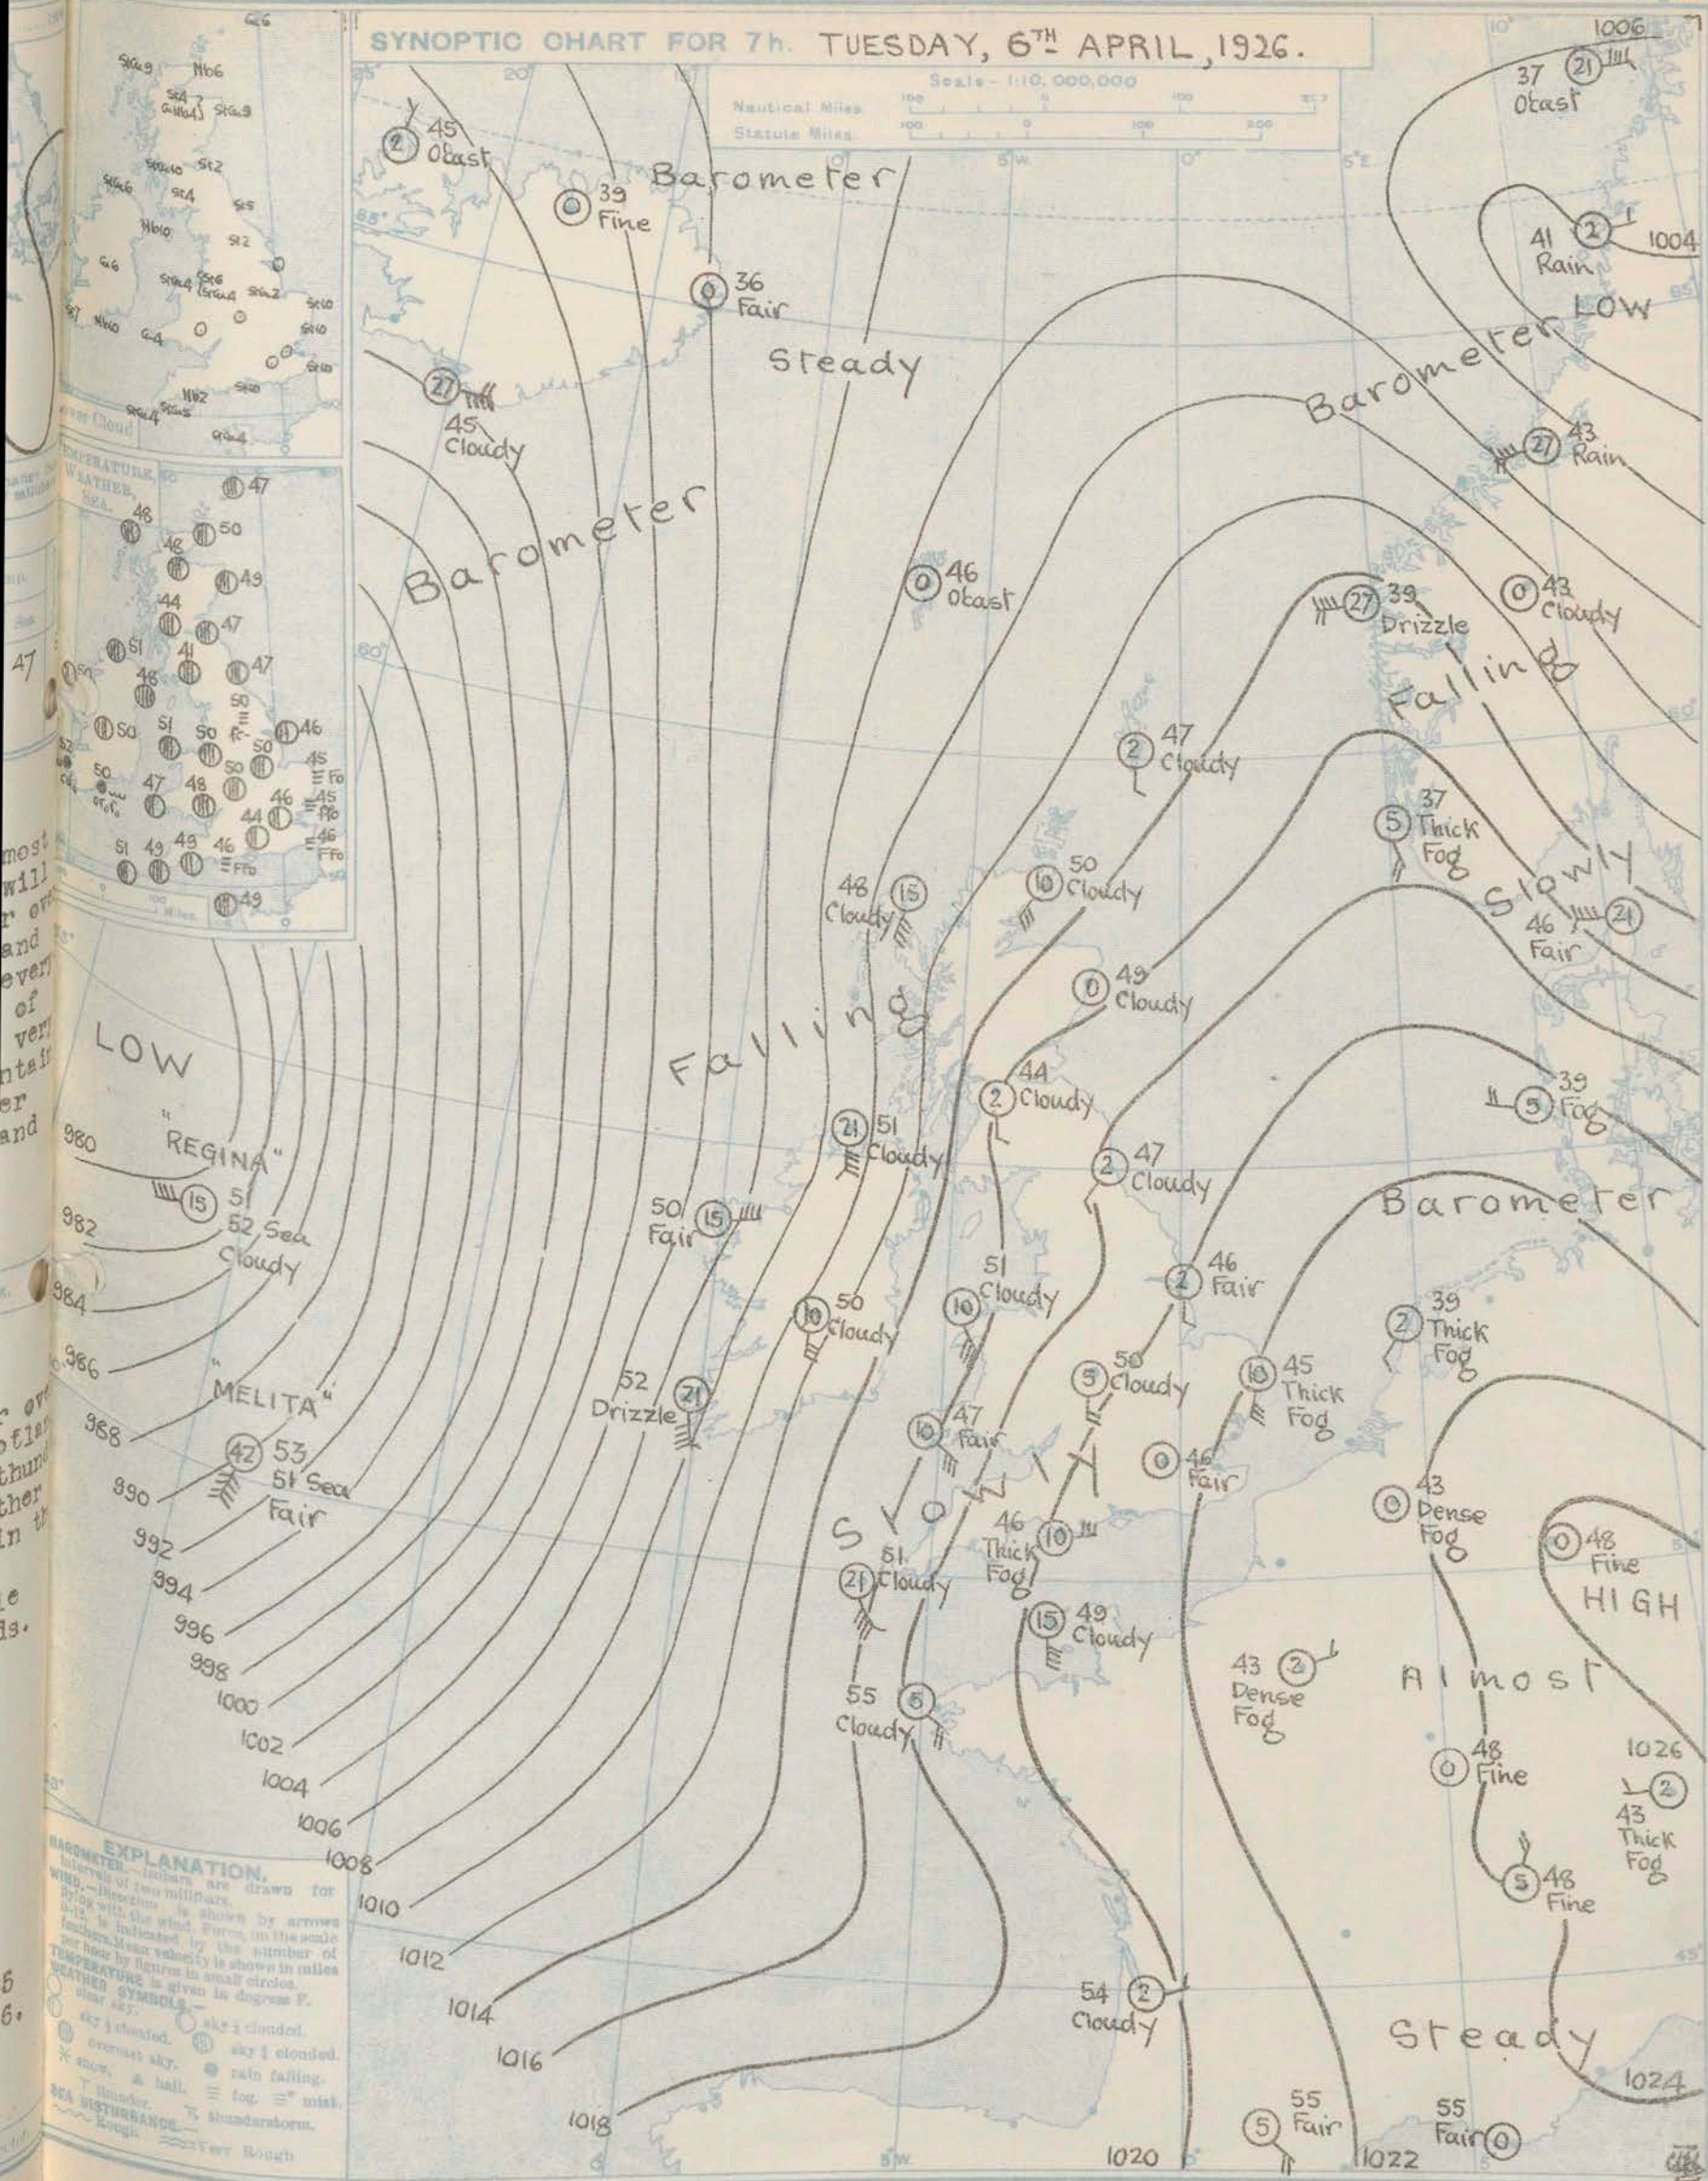

South Cone hoisted 18.55 G.M.T. 5/4/26.

G. C. SIMPSON, F.R.S., Director.

EXPLANATION.
Isobars are drawn for intervals of two millibars.
Wind direction is shown by arrows pointing with the wind. Force, on the scale below, is indicated by the number of barbs. Mean velocity is shown in miles per hour by figures in small circles.
TEMPERATURE is given in degrees F.

GENERAL INFERENCE.

A shallow trough of low pressure moving eastwards across England will be followed by a ridge of high pressure from the Atlantic. A depression indicated further out on the Atlantic will probably move northeastwards and cause unsettled conditions along our northwest seaboard. Elsewhere weather, apart from local showers and a risk of thunder, will be mainly fair to cloudy.

Further Outlook.

Unsettled but probably mainly fair in the Southern half of the Kingdom.

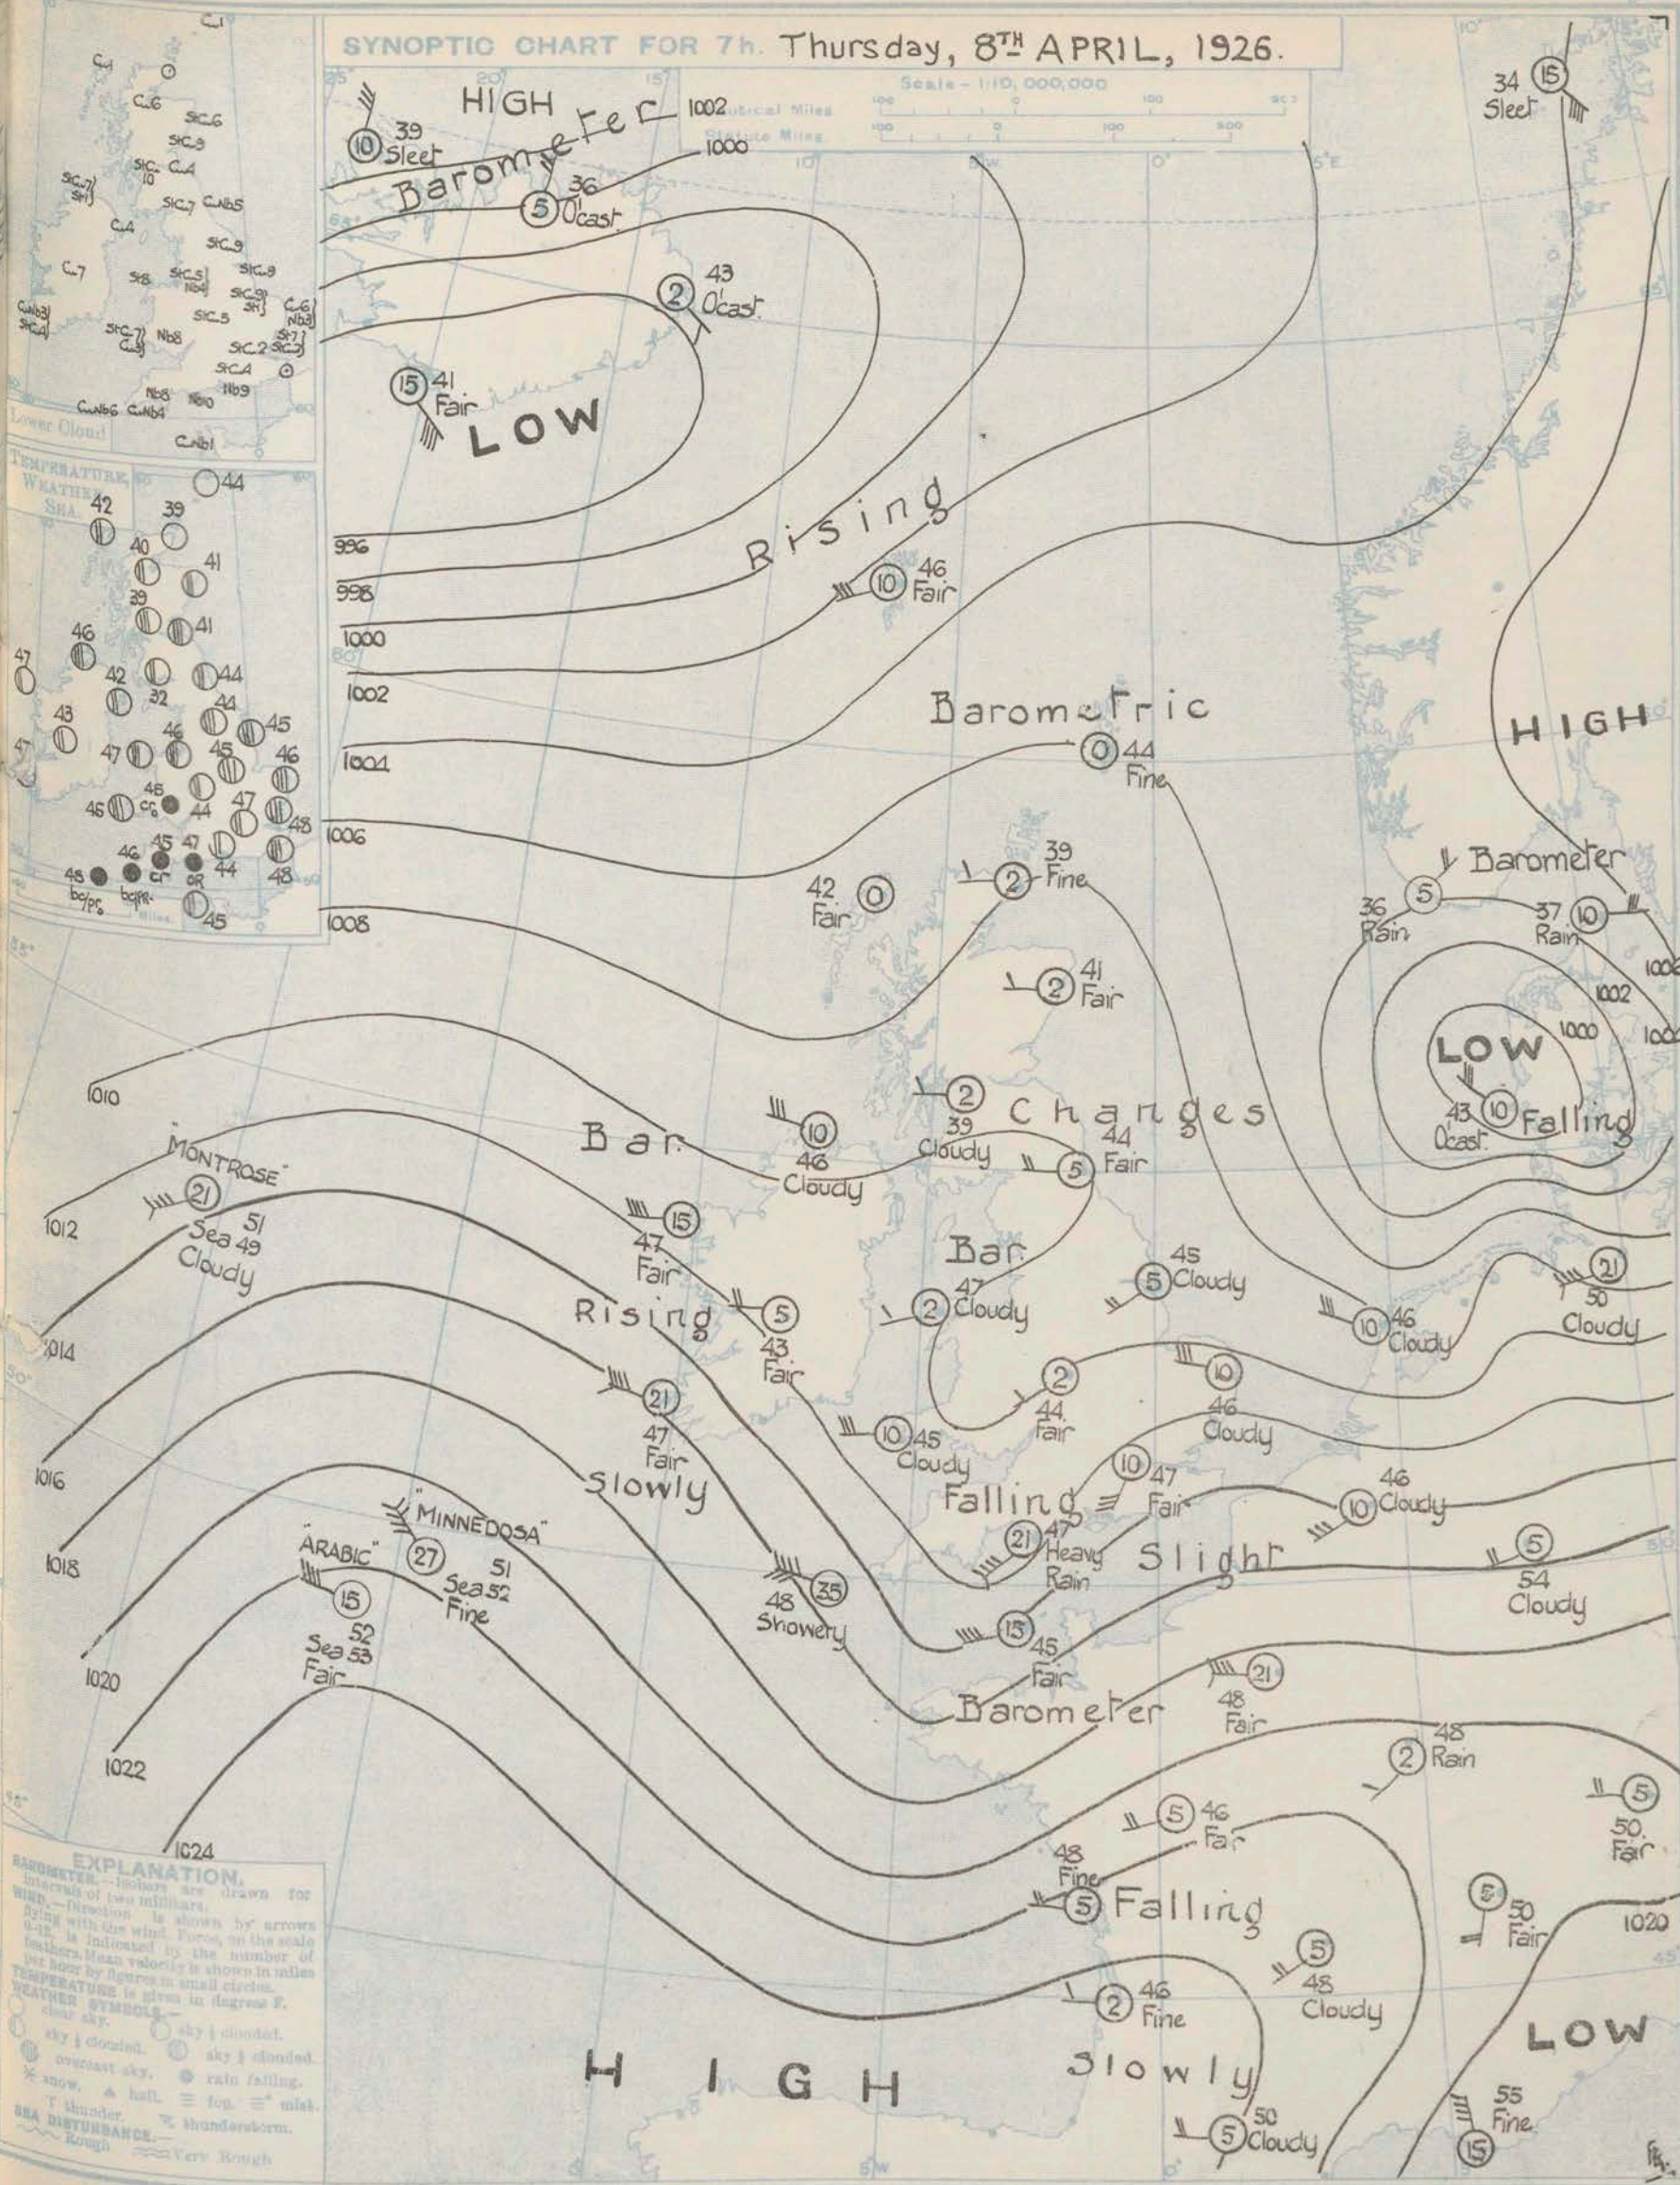

Districts.

Forecasts for the 24 hours commencing 15h. G.M.T. Thursday, 8th April, 1926.

SYNOPTIC CHART FOR 7h. Thursday, 8TH APRIL, 1926.

Scale - 1/10,000,000

EXPLANATION.
Barometer - Isobars are drawn for intervals of two millibars.
Wind - Direction is shown by arrows pointing with the wind. Force, on the scale 0-12, is indicated by the number of feathers. Mean velocity is shown in miles per hour by figures in small circles.
Temperature is given in degrees F.

GENERAL INFERENCE.

A ridge of high pressure moving slowly east across the British Isles will cause generally quiet sunny weather over Britain today but an Atlantic depression will cause freshening southeast winds in Ireland and on the west coast of England and Scotland with some rain tonight and tomorrow in Ireland and the extreme southwest of England.

GENERAL INFERENCE.

An anticyclone over the North Sea is moving east while pressure is falling in Iceland, also in the southwest of England. Winds will be easterly in Southern England and Ireland but more southerly or variable in northern districts. The weather will be mainly fine to cloudy today but unsettled conditions are probable later in the South-west.

GENERAL INFERENCE

The anticyclone which now extends from Central Europe to the North Sea and covers most of the British Isles will maintain generally fine sunny weather in all districts, with easterly winds in the South, and Southeast to south winds in the North. Further frosts are probable at night and these may be rather sharper in the Midlands and in the North.

GENERAL INFERENCE.

Pressure is high in a belt from south of the Azores to Southern Russia and is very low south of Greenland. Further secondary troughs of low pressure will pass northeastward outside our N.W. coasts. Winds will be southwesterly, strong on our N.W. coasts, and weather will be fair in the Southeast and unsettled in the Northwest.

SYNOPTIC CHART FOR 7h WEDNESDAY, 14TH APRIL, 1926.

EXPLANATION.
Isobars are drawn for intervals of two millibars.
Direction is shown by arrows.
Force, on the scale 0-12, is indicated by the number of lines.
Mean velocity is shown in miles per hour by figures in small circles.
TEMPERATURE is given in degrees F.
WEATHER SYMBOLS.
☉ sky; clear.
☁ sky; cloudy.

GENERAL INFERENCE.

A depression east of Iceland is moving slowly north, and a secondary trough is crossing the British Isles, and is developing a centre off Scilly, which will move E.N.E. and probably soon fill up. Its passage will be accompanied by heavy rain and local thunder. The anticyclone to S.W. of the British Isles is likely to advance and cause a general improvement.

Districts.

Forecasts for the 24 hours commencing 15h. G.M.T. Friday, 16th April, 1926.

Farther Outlook.

GENERAL INFERENCE.

A depression, centred between Iceland and the Hebrides, together with a secondary trough extending southeastwards from it across the North Sea, is gradually filling up, while a new depression is indicated approaching our western seaboard from the Atlantic. Weather, apart from local thundery showers, will be fair to cloudy for a time generally, but further rain will soon spread in from the West and may reach eastern districts early tomorrow.

Districts. Forecasts for the 24 hours commencing 15h. G.M.T. Saturday, 17th April, 1926.

Further Outlook.

Unsettled.

Nautical Miles

Statute Miles

EXPLANATION.
Isobars are drawn for intervals of two millibars.
Direction is shown by arrows.
Force, on the scale, is indicated by the number of millibars.
Mean velocity is shown in miles per hour by figures in small circles.
Temperature is given in degrees F.

GENERAL INFERENCE.

A complex depression covers the North Sea having centres over Northeastern Scotland and the Netherlands. The Northern centre will gradually disintegrate and the Southern centre move northeastwards. Weather will be mainly fair to cloudy apart from local thundery showers. Day temperature will be moderate to rather high but ground frost will occur in most places.

GENERAL INFERENCE.

A depression continues centre over the North Sea while a secondary off the southwest of Ireland is moving east or south-east. Apart from local showers weather will be mainly fair to cloudy in the northern half of the kingdom, while in the south rain will spread from the west eastwards. Winds, although generally light or moderate, will probably reach gale force at times in the Channel area.

Districts.

Forecasts for the 24 hours commencing 15h GMT Tuesday, 20th April, 1926.

EXPLANATION.
Isobars are drawn for every 2 millibars.
Wind direction is shown by arrows.
Wind force is indicated by the number of strokes.
Mean velocity is shown in miles per hour by a circle with the number inside.
Temperature is given in degrees F.
Relative humidity is given in degrees F.
Sky: (circle with dots) sky cloudy.
Sky: (circle with horizontal lines) sky partly cloudy.
Sky: (circle with vertical lines) sky clear.
Rain: (circle with diagonal lines) rain falling.
Thunder: (circle with zigzag lines) thunder.
Snow: (circle with asterisks) snow.

GENERAL INFERENCE.

A complex depression over the North Sea is gradually filling up. Further secondaries are likely to cross the British Isles and maintain unsettled conditions generally. Some fair periods will occur in most places but local thunderstorms will be rather widespread.

GENERAL INFERENCE.

A depression over Denmark is slowly filling up and a belt of high pressure extends from Iceland to the Azores. Winds will be northerly and weather mainly fair to cloudy apart from local thundery showers and a risk of occasional rain in Eastern Coastal districts. Day temperature will be moderate and ground frost widespread at night.

Further Outlook

Probably mainly fair but conditions remain rather unsettled.

GENERAL INFERENCE.

An anticyclone, centred between Iceland and Scotland, covers the British Isles. Apart from a few local showers weather will be mainly fair, sunny periods and a rather higher day temperature occurring nearly everywhere. Morning mist or fog will occur locally and ground frost, severe in places, will be fairly general at night.

GENERAL INFERENCE.

A depression over eastern France is moving northwards while pressure remains high over the Faeroes and Norway. Winds will be mainly northeasterly reaching gale force in the southern part of the North Sea and the weather unsettled in England and southern Scotland with some rain locally near the East coast. Conditions will be fairer in Ireland and northern Scotland.

GENERAL INFERENCE.

A depression over the southern part of the North Sea is moving north-northwest and becoming less deep and the Scandinavian anticyclone is withdrawing towards the Northeast. Fair weather is likely in Ireland and Southwest England but elsewhere skies will be mainly overcast with rain or drizzle at times, particularly in the North.

GENERAL INFERENCE.

The anticyclone over Scandinavia persists and a complex low pressure area, with secondary centres off our Southwest Coasts, stretches from Greenland across the Bay of Biscay to the Mediterranean. Winds will be variable or easterly and weather mainly cloudy with occasional drizzle locally. Some fair periods are not improbable generally. Mist or fog will occur locally particularly in coastal districts.

GENERAL INFERENCE.

The British Isles will remain in the easterly winds between an anticyclone north of Scandinavia and a rather deep depression between the Azores and Iceland. Occasional rain is probable in most places with mist or fog at times, but sunny intervals are expected, particularly in Ireland and Western England.
