With present weather is combined, whenever possible, the general character of the weather.
A "solidus" divides actual existing weather from preceding conditions, thus: -bc/r = fair weather after rain; i = intermittent; - = "decreasing"; + = "increasing"; h(r) = "hail" or "rain and hail"; Capital letters indicate intensity, suffix o indicates slight; and repetition of letters continuity, thus: -
E = heavy rain
rr = continuous moderate rain
r_o_r_o = continuous light rain.

METEOROLOGICAL OFFICE, LONDON.

NOTES ON THE INFORMATION CONTAINED IN THE BRITISH AND INTERNATIONAL SECTIONS OF THE DAILY WEATHER REPORT.

Heights of Stations.—The heights of British Stations above M.S.L. published in the British Section of the Daily Weather Report refer to the plot of ground on which the rain gauge is situated.

Pressure.—The distribution of barometric pressure at Mean Sea Level is shown by means of isobars which are drawn for intervals of 2 millibars on the British Section of the Report and for intervals of 4 millibars on the International Section.

The wind at a height of 1,500-2,000 feet above ground usually blows along the isobars and, for the same temperature, pressure and latitude, the speed of the wind is inversely proportional to the distance between the isobars, e.g., for isobars 1 inch apart in the Daily Weather Report the speed of the upper wind is about 12 m.p.h. in latitude 55°, with a temperature of 50° F. and a pressure of 1,015 mb; if, however, the isobars are $\frac{1}{2}$ inch apart the corresponding speed is 24 m.p.h.

The scale below can be used with both the International and the British Sections. If the distance between consecutive isobars is measured along the rule from the left-hand extremity the geostrophic wind is shown by the scale in miles per hour.

GEOSTROPHIC WIND SCALE FOR

4 mb isobars on 1 : 2 × 10⁷ Charts.
or 2 mb " " 1 : 10⁷ "
or 1 mb " " 1 : 5 × 10⁶ "

Miles per hour.

This scale applies under the following conditions:—

Pressure, 1,015 mb. Temperature, 50° F. Latitude, 55°.

Corrections.—For an increase of 10 mb pressure, subtract 1% from velocity; for an increase of 10° F. add 2%. From Latitude 55° to Latitude 65° subtract 1% for each degree above 55°. From Latitude 55° to Latitude 45° add 1½% for each degree below 55°.

Temperature.—Temperature is specified in degrees Fahrenheit, and is shown on the charts by means of figures written alongside the circles which indicate the positions of the stations.

Relative Humidity.—From January 1st 1926, relative humidity at British stations has been calculated from the following hygrometric formulæ:

$$x = f - .444(t - t')$$

$$x = f - .400(t - t')$$

where x is the vapour pressure in mb;

f the saturation vapour pressure at the temperature of the wet bulb;

t the dry bulb temperature; and

t' " wet " "

The use of Glaisher's tables has been discontinued.

The tables used for calculating humidities from the readings of the dry and wet bulb thermometers on aeroplanes, are based on a formula similar to the above, but allowance is made for the variation of barometric pressure with height and for the increased ventilation of the thermometers.

Upper Air Temperature.—The British observations are made normally, one at 1,000 feet above the level of the aerodrome, and the remainder at pressures of 950, 900, 850, 800, etc., millibars. Heights are then computed and, apart from instrumental error, are correct heights: they do not require modification for differences of temperature from normal as these are allowed for in the computation. The values are shown graphically and in tabular form in the Upper Air Supplement. On the diagram, temperatures are given in degrees Fahrenheit and Absolute. The oblique line marked "Dry Adiabatic" shows the lapse rate of temperature for dry air ascending or descending under adiabatic conditions, i.e., without communication of heat from external sources. The lapse rate under these circumstances is very approximately 5.5° F. per 1,000 feet, or 10°a per kilometre. A lapse rate greater than this value indicates instability in a dry atmosphere.

The broken lines marked Saturated Adiabatic show lapse rates for saturated air. These are for air masses which contain just sufficient moisture at 1,015 mb. pressure to become saturated after rising 1 km. in an environment having the dry adiabatic lapse rate. The condensed moisture is assumed to be retained thereafter in the air as it rises.

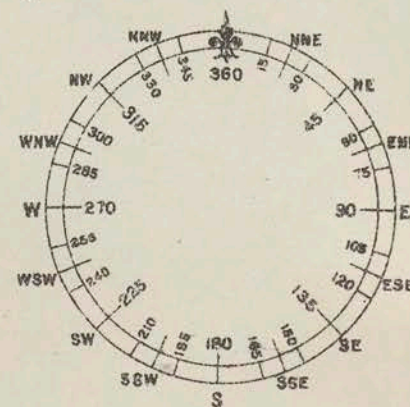

Times of Sunrise, Noon and Sunset.—From January 1st, 1926, the times of Sunrise, Noon and Sunset published in the British Section of the Report for certain stations have been recalculated from (1) the figures for the duration of sunshine contained in the International Meteorological Tables and (2) the value of the sun's declination and the equation of time published in the Nautical Almanac. The change of declination of the sun on the same day from year to year over a cycle of four years is now taken into account. This change was formerly neglected.

Wind.—All wind directions specified in the reports are "true," as distinguished from "magnetic." The arrows indicating wind direction are drawn to fly with the wind. Wind velocities are shown on the charts of the British Section and Upper Air Supplement in m.p.h. by the numbers placed within the small circles. In the International Section velocities are not shown. In both Sections the number of feathers on the arrows denotes wind force by Beaufort number.

Upper Winds.—The direction and velocity of the wind are given in the charts of the Upper Air Supplement for heights of 2,000 feet and 6,000 feet. The data are also given in tabular form for various heights. The reports are usually based on Pilot Balloon ascents.

Wind reports deduced from British Pilot Balloon Ascents refer to the 1,000 feet layers centering at the heights given in the table up to 16,000 feet. When winds are reported at greater heights, they refer to the 5,000 feet layers centering at 20,000 feet, 25,000 feet, 30,000 feet and 35,000 feet.

In the tabular statement direction is specified in degrees from true north measured through East 90°, South 180°, West 270° to North 360°. (See diagram below.)

Rainfall.—At Stations marked \dagger in the International Section of the Report the rainfall is received in an abbreviated code and the measurement entered is therefore not necessarily correct to the nearest millimetre. For example any fall between 1 and 15 mm. would be reported by the same code figure and entered as 13 mm. in the Report.

Sea Disturbance.—The code for sea disturbance used at coastal stations is given on p. 1 of the British Section of the Report. Ships at sea use the following code:—

- | | | | | | |
|-----------------------|---------|--------------|-----------------------|---------|-----------|
| 0. No or slight swell | } and { | Sea smooth | 5. No or slight swell | } and { | Sea rough |
| 1. Moderate swell | | to moderate. | 6. Moderate swell | | or above. |
| 2. Heavy " " | | | 7. Heavy " " | | |
| 3. Long low " " | | | 8. Long low " " | | |
| 4. Confused " " | | | 9. Confused " " | | |

Adjusted Readings.—Where an instrumental reading is found to be in error and some adjustment is necessary, such adjusted reading is published in brackets thus (59).

The entries in the British Section of the Report for the stations in the main tables on pages 1, 2, and 4 are compared with those in the returns received from the stations at the end of the month and errors in the Report so found are noted in the monthly correction sheets.

The reports from the London Stations on page 1 and from the Health Resorts on page 4 are not subjected to the same close scrutiny but if any errors are found these are also noted in the correction sheets.

SUPPLEMENT TO THE DAILY WEATHER REPORT OF THE METEOROLOGICAL OFFICE, LONDON.
SUMMARY OF METEOROLOGICAL OBSERVATIONS AT SELECTED STATIONS ISSUED ON THE 1st DAY OF EACH MONTH.

Notes on the Weather of

MAY,

1927.

The cold weather experienced at the end of April was followed by a marked rise in temperature during the first week in May. On the morning of the 1st, some very low minima were recorded (18°F. in the screen at Eskdalemuir and 14°F. on the grass there and at Greenwich) whereas maxima between 70°F and 80°F occurred in many parts on the 7th and 8th. 81°F. was recorded at Tottenham on the 7th and 87°F at Ford (Argyllshire) on the 8th. Thunderstorms occurred locally on several days and were reported from many parts of England on the 4th.

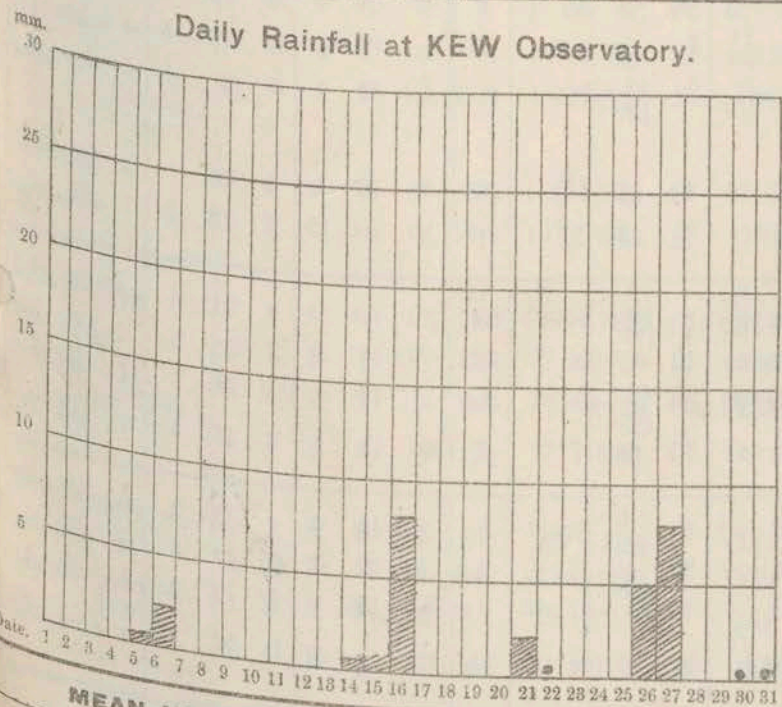

After the 9th, the winds became more northerly for a while, temperature dropped considerably and some sleet was experienced on the Northeast Coasts. By the 14th, however, the approach of a depression off the Hebrides caused southwesterly winds and warmer, generally unsettled weather. On the 16th, a thunderstorm at Rothesay was reported to be the most severe experienced at that station for over twenty years.

A belt of high pressure subsequently extended across the British Isles giving a few days fine, sunny weather, temperature rising to about 70°F. in some cases but on the whole the weather during the latter part of the month, though mainly fair, was of a somewhat unsettled character. Temperature varied a good deal in the South while rather cool northerly winds prevailed in the North.

The total sunshine was well above the average at Kew Observatory but at Aberdeen there was a marked deficiency.

Rainfall was much below the average in many parts of England and Ireland and only amounted to 11 mm. at Gorleston, 13 mm. at Calshot and 16 mm. at Falmouth. In some parts of Scotland, however, there was rather more than the average.

GENERAL INFERENCE.

An anticyclone is moving eastwards across the British Isles while a depression some six hundred miles westward of the mouth of the Channel is moving northwards and another is indicated south of Iceland. Weather will be mainly fair or fine but a few showers may be experienced in the extreme North while in the Southwest cloudier conditions are probable with some rain before long. Temperature rather low to moderate with further frost at night in many places.

Further Outlook

Probably fair in the Southeast less settled in the North and West; somewhat warmer.

Districts.

All times are G.M.T. Add one hour after summer time.

EXPLANATION.
 Isobars are drawn for intervals of two millibars.
 Direction is shown by arrows pointing with the wind. Force, on the scale with the number of tenths, is indicated by the number of tenths.
 Mean velocity is shown in miles per hour by figures in small circles.
 Temperature is given in degrees F.
WEATHER SYMBOLS.

GENERAL INFERENCE.

A large anticyclone centred over Southern Sweden is moving southeast and covers the British Isles, maintaining fine weather apart from local fog on the east coast. A shallow depression over France will probably spread north and renew thundery weather over Southern England before long.

Districts. Forecasts for the 24 hours commencing 15h. GMT. Saturday, 7th May, 1927.

1. S.E. England	Wind N.E., light to moderate or fresh; mainly fine but perhaps local thunderstorms or thundery rains later; local coastal fog; warm.

GENERAL INFERENCE.

With pressure rising generally over the British Isles an anticyclone off our northwest coasts appears to be moving southwards to join another anticyclone centred off our southwest coasts. Weather will be mainly fair but cooler than of late. A few scattered showers are probable, chiefly in eastern coastal districts.

Districts.	Forecasts for the 24 hours commencing 15h G.M.T. Tuesday, 10th May, 1927.	Further Outlook
1. S.E. England	Wind northeasterly, fresh locally; mainly fair to cloudy; a few local showers near the coast; visibility moderate to good apart from local morning mist; much cooler than of late, with slight ground frost locally at night.	Mainly fair but colder with perhaps sharp ground frost at night in eastern districts.
2. E. England		
3. E. Midlands		
4. W. Midlands		
5. S.W. England	Northeasterly or variable winds, light to moderate; variable skies, local showers; visibility mainly moderate to good but local coastal mist or fog; cooler.

GENERAL INFERENCE.

A large anticyclone extending along our western seaboard and secondary depression is moving southeastwards over Denmark. Another secondary is likely to move from Iceland across Northern Scotland to the North Sea and cause rather unsettled weather in Scotland; elsewhere weather will probably continue mainly fair for a time. Further frosts will occur in most places tonight.

Further Outlook.

Unsettled in the North; probably little change in the South.

All times are G.M.T. Add one hour
for summer time.

EXPLANATION.
Isobars are drawn for
every two millibars.
Direction of wind is shown by arrows
on the isobars. Force on the
isobars is indicated by the number
of arrows. Mean velocity is shown
by figures in small
circles.
Temperature is given in degrees F.
Sky symbols:
☉ Sky less than 1
clouded.
☁ Sky more than 1
clouded.
☂ Rain falling.
☃ Thunderstorm.
☄ Very Rough.

GENERAL INFERENCE.

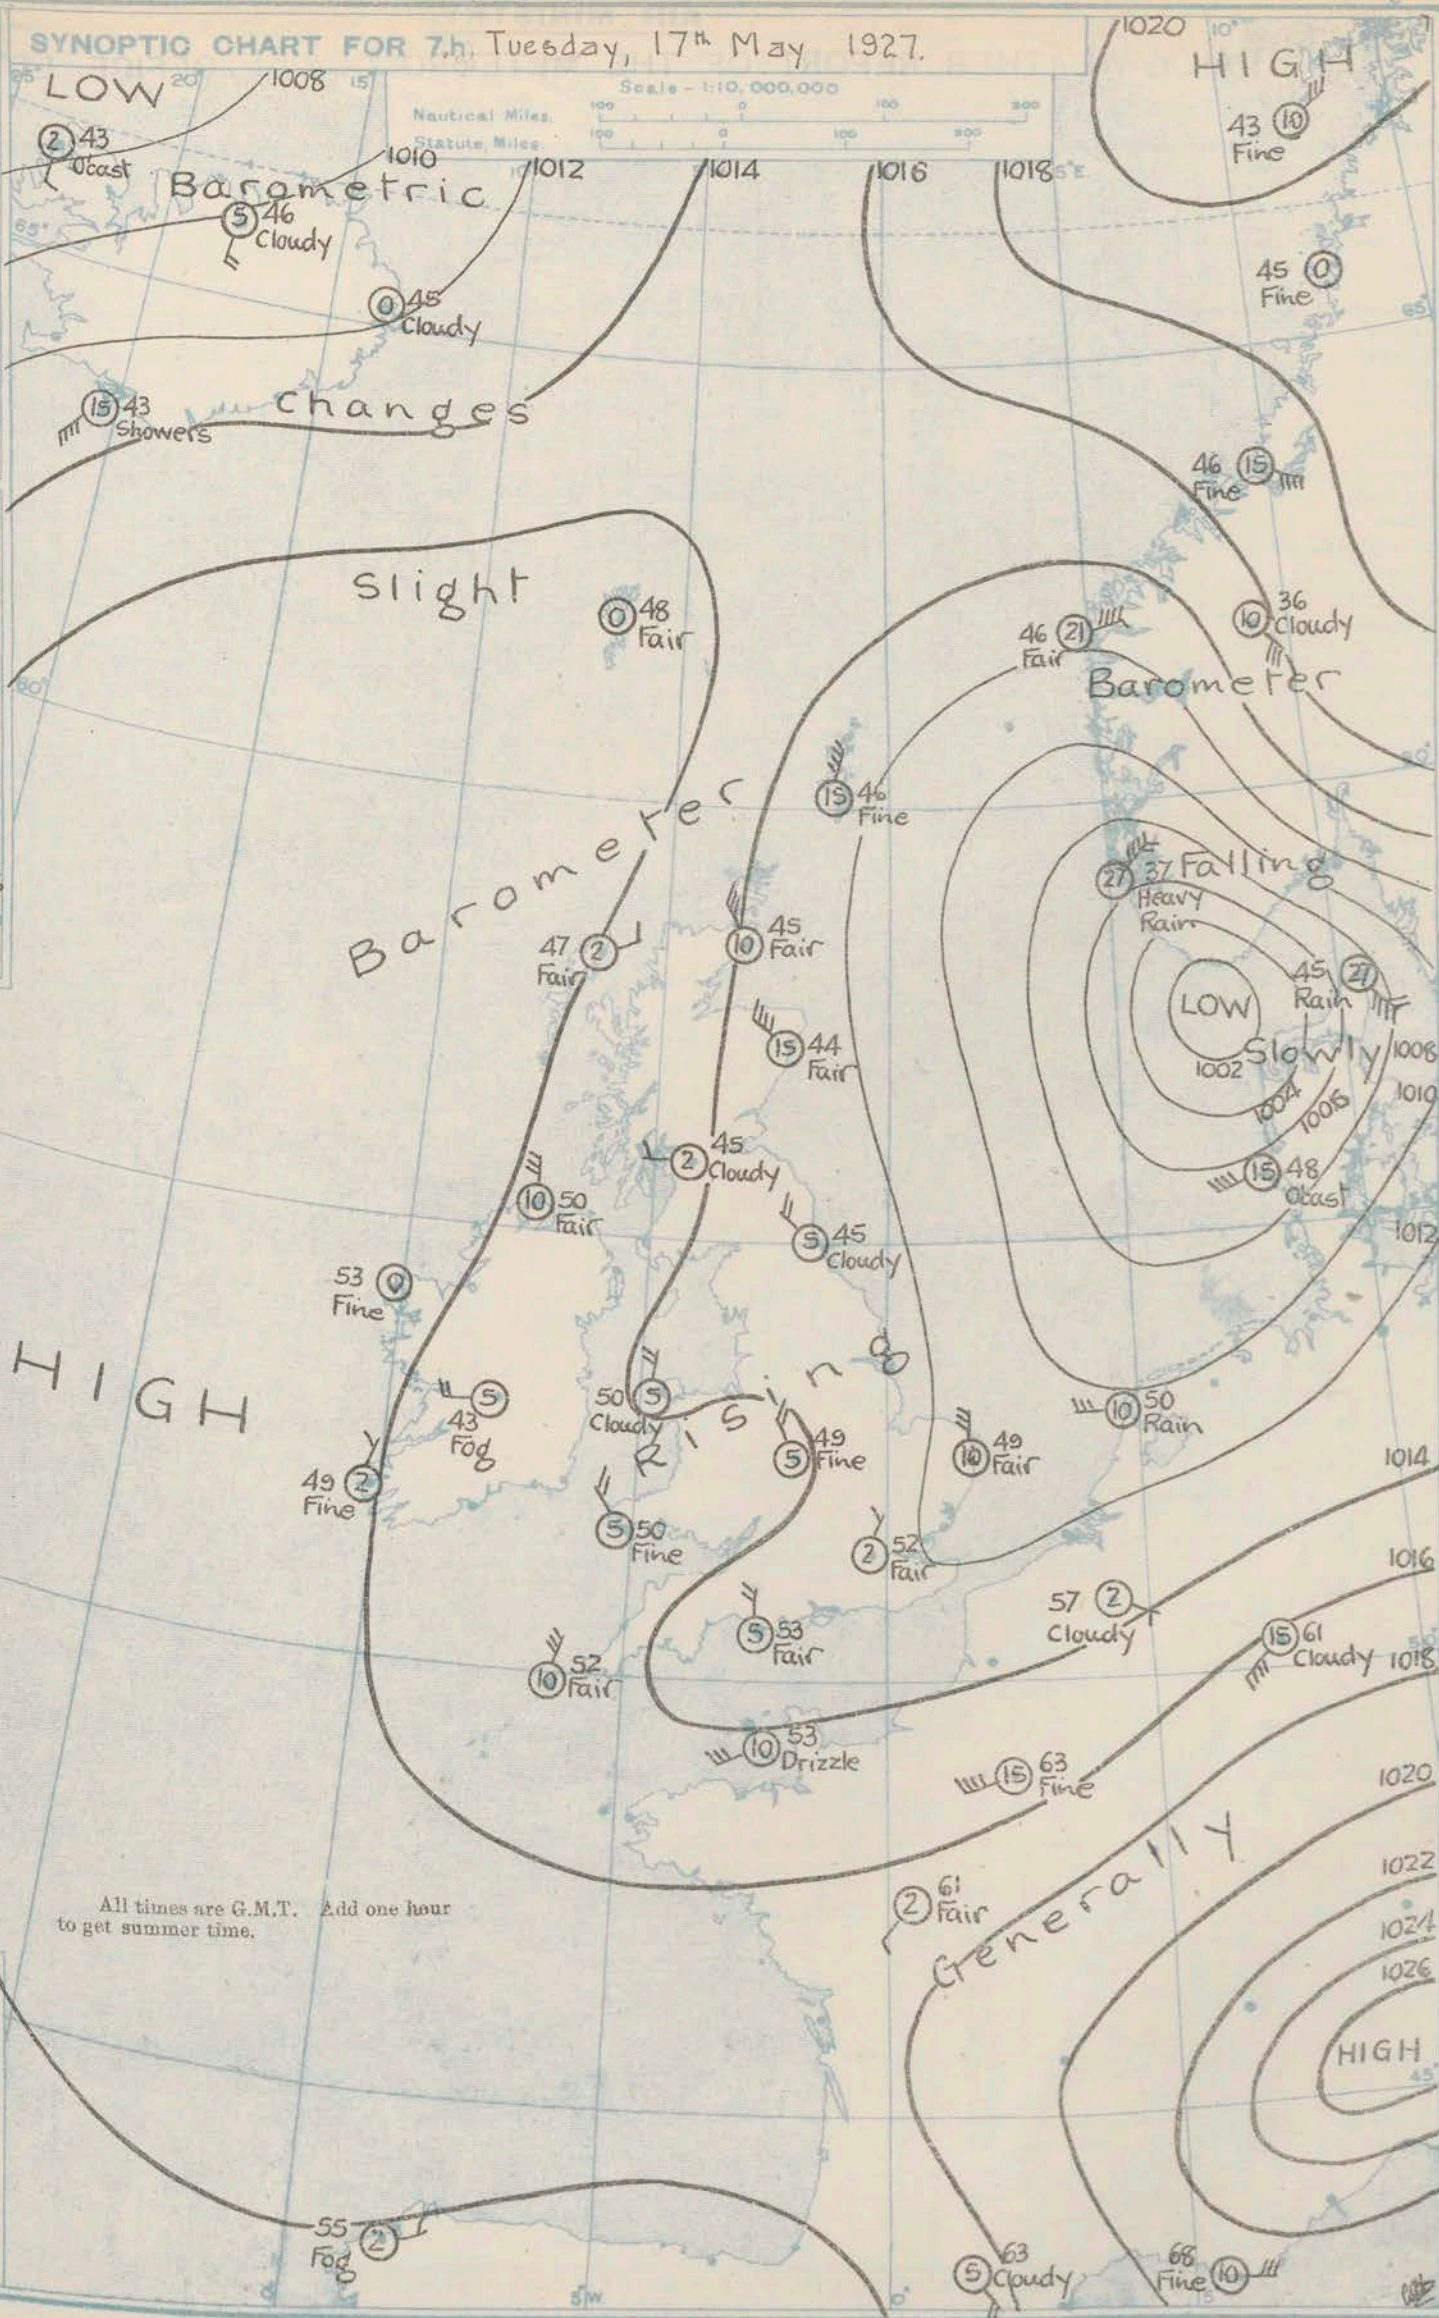

In the rear of a depression now over the Skager Rak, a wedge of high pressure westward of Ireland is spreading east. Weather will be mainly fair apart from local thundery showers, but another depression southwest of Ireland, may cause an early renewal of unsettled conditions.

Further Outlook

Unsettled.

Districts.	Forecasts for the 24 hours commencing 15h. G.M.T. Tuesday, 17th May, 1927.
1. S.E. England	Light northerly winds, becoming variable; fair apart from local thundery showers; visibility mainly good but mist locally night and morning; mild or moderate temperature.
2. E. England	
3. E. Midlands	
4. W. Midlands	
5. S.W. England	Wind light variable, becoming from a southerly direction later; fair apart from scattered thundery showers at first; probably less fair later; visibility moderate to good but mist locally night and morning; rather warm.
6. South Wales	
7. North Wales	Wind light variable; fair apart from scattered thundery showers at first; visibility moderate to good, but mist locally night and morning; mild or moderate temperature.

SYNOPTIC CHART FOR 7h Tuesday, 17th May 1927.

All times are G.M.T. Add one hour to get summer time.

EXPLANATION.
Isobars are drawn for intervals of two millibars. Direction of the wind is shown by arrows. Force, on the Beaufort scale, is indicated by the number of arrows. Mean velocity is shown in figures in small circles.
Temperature is given in degrees F.
Sky symbols:
☁ Sky less than 1/2 clouded.
☁ Sky more than 1/2 clouded.
☁ Sky more than 3/4 clouded.
☁ Sky completely clouded.
☁ Sky with rain falling.
☁ Sky with fog.
☁ Sky with mist.
☁ Sky with thunderstorm.
☁ Sky with very rough weather.

A large anticyclone extending from Mid-Atlantic across the British Isles to Central Europe will maintain fine weather except for local showers in Northern Scotland. Thundery conditions may spread up later from the Bay of Biscay to the extreme S.W. of England.

Mainly fine and warm, but thunder conditions may spread up slowly from southwest over the southern half of the Kingdom.

GENERAL INFERENCE.

In the rear of a depression now over the Southern North Sea the Atlantic anticyclone has spread in over the British Isles. A fresh depression over Iceland is moving east. Winds will be between N. and N.W. moderating somewhat, and backing towards west in northern districts. Weather will continue cool with local thundery showers, especially in eastern districts, but there will be considerable bright intervals.

Districts.	Forecasts for the 24 hours commencing 15h. G.M.T. Sunday, 22nd May, 1927.
1. S.E. England	Wind N. to N.W., moderate or fresh, becoming lighter, mainly fair, local thundery showers at first,; visibility good. cool with local ground frost at night.
2. E. England	
3. E. Midlands	
4. W. Midlands	
5. S.W. England	
6. South Wales	
7. North Wales	
8. N.W. England	
9. N. Midlands	
10. N.E. England	
11. S.E. Scotland	Moderate northerly winds becoming light and backing towards west, mainly fair apart from scattered showers at first, probably less fair tomorrow; visibility good to moderate, cool with local ground frost tonight.
12. S.W. Scotland & Isle of Man	
13. A.W. Scotland	
14. N.W. Scotland	
15. Mid-Scotland	
16. N.E. Scotland

GENERAL INFERENCE.

There is a large anticyclone off our southwest coasts and a depression north of Iceland, while a secondary off our north-west coasts is moving eastward and deepening. Another secondary far out in the Atlantic will move E.N.E. and become deeper. Weather will be fair in the South but unsettled in the North.

Further Outlook.

GENERAL INFERENCE.

From an anticyclone, centred just to the southwest of Iceland a ridge of high pressure extends southeastwards across the British Isles. Apart from a few scattered showers, chiefly in eastern and northern coastal districts, weather will continue mainly fair but rather cold. A tendency for local thundery showers will develop over southern districts.

Further Outlook

Districts.	Forecasts for the 24 hours commencing 15h. GMT. Saturday, 28th May, 1927.
1. S.E. England	Variable winds, mainly between north and east, light to moderate; fair to cloudy but tendency for local thundery showers; visibility mainly moderate to good; rather cold, ground frost locally at night.
2. E. England	
3. E. Midlands	
4. W. Midlands	Northerly winds, fresh locally; fair to cloudy, occasional local showers; visibility moderate to good; rather cold, ground frost locally at night.
5. S.W. England	
6. South Wales	Variable winds, mainly easterly, light to moderate or fresh; variable skies, local thundery showers; visibility moderate to good; rather cold, ground frost locally at night.
7. North Wales	
8. N.W. England	Northerly winds, fresh locally; fair to cloudy, a few scattered showers, particularly in coastal districts; visibility mainly moderate to good; rather cold, ground frost locally at night.
